Since the founding of the British colonies on the eastern seaboard of North America, settlers attempted to spread west across the continent. By the mid-eighteenth century, much of the eastern coastline and the adjacent interior had been settled, and colonists ventured into the Ohio and Mississippi river valleys. This led to conflict with the French, who claimed the territory, and with Native Americans, who had lived there for centuries. However, France relinquished these territorial claims in 1763 after its defeat by the British in the French and Indian War. After defeats in the War of 1812, the Creek War, and the Black Hawk War, Native Americans were

subject to forced removal beginning in 1829 under President Andrew Jackson. By 1795 over 200,000 white Americans lived in this region. Their numbers climbed to over 1 million by 1810 and more than 6 million by 1850.

A more significant stage of westward migration commenced in the mid-nineteenth century as U.S. territory expanded to the Pacific coast. This expansion was achieved through the Louisiana Purchase (1803) and Mexico's cession (1848) of its lands north of the Rio Grande following the Mexican-American War. In addition, the United States acquired territory in Florida and the Pacific Northwest from Spain and Great Britain, respectively. Between 1840 and 1870, over 300,000 Americans migrated to the West, many of them making the arduous journey in caravans of covered wagons. Most individuals and families migrated to the West for economic reasons. Many were family farmers of modest means who lived in the Midwest or Upper South. However, the largest single group of migrants, nearly 120,000 (mostly single men), came to profit from the California gold rush, which started in 1849. Others sought greater personal freedom. The Mormons, for example, sought the freedom to worship as they pleased. African Americans, many of them newly freed from slavery, migrated to towns on the Great Plains hoping for more opportunities. By 1880, 15,000 African Americans lived in the West. Though some found a greater degree of equality with whites, discriminatory laws and practices denied full citizenship and restricted their opportunities for decades.

For many migrants, the biggest attraction was the land reserved for public distribution by the federal government. The Homestead Act (1862) granted 160 acres (65 hectares) free to any citizen or immigrant qualified for naturalization who agreed to build a house on the land, live there, and farm it for five years. The law also allowed settlers to buy the land outright after they had lived on it for six months at the nominal price of \$1.25 an acre. Though this legislation benefited many white settlers, racial restrictions disqualified most nonwhites from the massive land distribution. Furthermore, Mexicans with land grants awarded by the Mexican government or the Spanish Crown were frequently dispossessed through the burden of

lengthy and expensive legal battles. Between 1862 and 1890, approximately 2 million people settled on nearly 375,000 farms claimed through the Homestead Act.

The passage of the Homestead Act corresponded to the construction of the transcontinental railroad. Completed in 1869, it linked Omaha, Nebraska, with Sacramento, California, transforming a journey that had taken several months by wagon or stagecoach into a five-day train trip. Covered wagons virtually disappeared after 1870, and the convenience of railroad travel encouraged further settlement.

Despite the promise of a better life in the West, the decision to migrate was not easy. Migrants and settlers faced a series of Indian wars in the second half of the nineteenth century, though Native American power in the West was subdued by 1890. The physical challenges of the terrain also made the journey treacherous. Nearly 10,000 migrants died on the westward trails, with disease causing 90 percent of all deaths. Moreover, the journey was costly. Although the Homestead Act offered free land, it cost between \$750 and \$1,500 to travel to Oregon or California and establish a farm in the 1840s and 1850s. Thus, the very poor were unlikely to migrate.

Immigration Restrictions in the United States and White Settler Colonies

During the second half of the nineteenth century and the early twentieth century, the United

States most self-governing colonies in the British Empire passed laws to restrict the immigration of Asians, mainly from China, India, and Japan. The European settlers in these colonies, having taken the land from the indigenous inhabitants, sought to avoid the arrival of non-Europeans, whom they perceived as racial inferiors and economic competitors.

The first immigration restriction laws were passed during the Australian gold rush. A small but steady flow of Chinese, mostly from Guangdong and Fujian provinces, had been arriving in eastern Australia during the 1840s, but this number increased with the discovery in 1854 of rich gold fields in the colony of Victoria. In 1855 the Victorian Parliament limited the number of Chinese migrants a ship could carry to one person per 10 tons of ship's weight and levied a poll or head tax of £10 on each arrival. The neighboring colonies of southern Australia and New South Wales passed similar laws to prevent Chinese from landing in their territory and then traveling overland to Victoria. When the gold rush declined in the 1860s, all three colonies repealed their legislation.

Chinese immigration to the west coast of North America led the U.S. Congress to pass the Chinese Exclusion Act of 1881. British Columbia likewise enacted a series of racist laws from 1878. Some of these laws were struck down by the government of Canada, but then in 1885 Ottawa passed an act to restrict Chinese immigration and introduced a head tax. By 1903 this tax had been increased to \$300 per person, and in 1906 Newfoundland established a similar levy. The American legislation led the Australian colonies to fear that the American ban on Chinese arrivals would lead to an influx to Australia. During the 1880s the Australian colonies reintroduced poll taxes and limits on the number allowed to be landed per ship's tonnage. Western Australia enacted immigration restrictions for the first time but still allowed Chinese to land in the underpopulated north of the colony.

European settlers in the southern African colony of Natal targeted their immigration restriction laws against Indians. In 1896 the government stripped Indians of voting rights on the grounds that the country they came from did not have a parliament (there is no record

that this argument was used to similarly prevent Russian migrants from voting). In 1897 Natal introduced a law requiring migrants to be able to pass a dictation test in a European language. The dictation test soon became the accepted method to restrict non-European migration throughout the British Empire. In 1902 neighboring Cape Colony copied the Natal legislation. British Columbia had done the same in 1900, although again the Canadian government disallowed the law. New Zealand adopted the dictation test in 1907.

The creation of the Commonwealth of Australia in 1901 enabled the passing of national laws to enforce the “White Australia” policy. The Immigration Restriction Act was passed in 1901, although it was not, as has sometimes been suggested, the first law created by the federal Parliament. Once introduced, the dictation test rarely had to be enforced, as it deterred most Asian migrants from even attempting to sail to a country where it was in place.

The Republic of Transvaal and the Orange Free State had introduced immigration restrictions toward Indians while they were independent states, and these remained in place after

British annexation. After the establishment of the Union of South Africa in 1910, more anti-Indian laws were passed. Mohandas Karamchand (Mahatma) Gandhi began his career of civil disobedience by leading the protests against this legislation and eventually forced the government of South Africa to compromise.

■ Introduction: Exploration

Although Europe’s “age of exploration” is usually identified with the sixteenth and seventeenth centuries, it would be more accurate to say that the discoveries of this era were but the first stage of a much longer era of exploration that lasted until the early 1900s, when the American Robert Peary reached (so he claimed) the North Pole in 1909 and the Norwegian polar explorer Roald Amundsen reached the geographic South Pole in 1911. By 1750, the work of exploring the globe was still far from complete. Explorers of the Age of Columbus had confirmed the earth’s great size, revealed the existence of a “new world” in the Americas, and opened up sea-lanes that linked the coastal peoples of most parts of the world. It was left to explorers of the eighteenth and nineteenth centuries to dispel persistent myths such as the

existence of an unknown southern continent (Terra Australis Incognita) and the possibility of rounding North America by a Northwest Passage; they also explored, mapped, and studied the African interior, much of North and South America, central Asia, most of Australia, the islands of the Pacific Ocean, and the regions of the northern Arctic and Antarctica. One constant in world exploration between 1500 and 1900 is that the explorers themselves and their sponsors were overwhelmingly Europeans, with some notable contributions made by Americans, Canadians, and Australians in the eighteenth and nineteenth centuries. Another constant was the complexity of these explorers’ motives.

Famously, the explorations of the age of Da Gama, Columbus, and Magellan were motivated by “God (making converts to Christianity and

hurting the Muslims), Gold, (economic gain), and Glory” (seeking personal fame and national prestige). Of these three, religion no longer was a significant inspiration for exploration in the nineteenth and early twentieth centuries. Although the nineteenth century saw an outburst of European and American missionary activity, much of it was concentrated in India, China, and the Middle East, areas that needed no further exploration. Missionaries serving in Africa and Oceania benefited from the discoveries of explorers and the attendant publicity, but neither the sponsors of exploration in these regions nor the explorers themselves saw themselves primarily as doing God’s work. A notable exception was David Livingstone (1813–1873), a Scottish Congregationalist minister who explored central and eastern Africa in the 1850s, 1860s, and early 1870s and became one of the great heroes of Victorian Britain. He hoped that his explorations and discoveries would pave the way for other Britishers to establish a presence on the continent and bring “God, Commerce, and Civilization” to the Africans.

The pursuit of economic gain persisted as a motive for exploration in the eighteenth and nineteenth centuries, but it was less of a factor than in earlier centuries, when explorers dreamed of vast fortunes to be made from the discovery of gold and new trade routes to Asia. In the eighteenth century similar dreams of wealth kept alive the searches for the “unknown southern continent” and northwest and northeast passages to Asia, but with the abandonment of such efforts in the nineteenth century, economic gain receded in importance. King Leopold II of Belgium provides the exception in this case. He hired the American journalist and explorer Henry Stanley to explore the Congo River basin in the 1870s as part of his grandiose plan to establish personal control over a vast commercial empire in tropical Africa. Other examples of economic motives for exploration include anticipated royalties from books, expeditions to investigate potential routes for railroad and telegraph lines, and publicity stunts such as the sponsorship of Stanley by the *New York Herald* to find the “lost” David Livingstone in Africa. More striking, however, is the number of expeditions that were undertaken despite

having no conceivable economic benefits. These include explorations of the Australian interior, the earth’s polar regions, and the deserts of Africa, Arabia, and central Asia.

If religious and economic motives declined in importance, the prospect of winning fame and glory remained as strong as ever. Captain James Cook, whose voyages to the Pacific between 1768 and 1779 ushered in a new era in the history of exploration, wrote in his journal during his first Pacific voyage that “Was it not for the Pleasure which Naturly [*sic*] results to a man from being the first discoverer, even was it nothing more than Sand or Shoals, this kind of Service would be insupportable especially in far distant parts like this, Short of Provisions and almost every other necessary.” Many others besides Cook were drawn to exploring for no other reason than to be the “first discoverer” of something: the Unknown Southern Continent, the source of the Nile, the course of the Niger, the North and South Poles, an ancient “lost city,” or some new natural wonder.

In admitting to the satisfaction he anticipated for being the first to discover something new, Cook was expressing a dream of countless earlier explorers; in other respects his voyages to the Pacific show that exploration was about to enter a new stage of its history. His first voyage was sponsored not just by the Royal Navy, which had an ongoing interest in the wind patterns, ocean currents, and islands of the Pacific, but also by the Royal Society of London, Britain’s leading scientific society. His primary mission was to take astronomical measurements on the island of Tahiti when Venus passed between the earth and the sun. This was part of a worldwide effort to observe the transit of Venus from a number of locations to better calculate the distance between the earth and the sun. He also had on board the notable botanist Joseph Banks, who along with two Scandinavian colleagues discovered, collected, and described hundreds of new plants from the islands they visited.

Cook’s contributions to science and the emerging academic discipline of geography inspired dozens of similar expeditions to the Pacific by the English, French, Russians, and Spaniards in the late eighteenth and early nineteenth centuries. The Spaniards also supported an ambitious

scientific expedition led by Alessandro Malaspina, who between 1789 and 1794 sailed around the globe to collect information and map Spanish possessions. His goal was not the expansion of Spanish power or the advancement of Spanish economic interests but rather the “progress of navigation, geography, and of humanity.” His voyage generated a tremendous amount of geographical and scientific information and brought back no less than 16,000 plants and seeds for the Royal Botanical Garden in Madrid. During the nineteenth century Britain’s Royal Geographical Society, France’s Société de Géographie, and many similar organizations promoted and subsidized exploration around the world. Their success can be measured by the fact that in 1895 delegates to a meeting of the International Geographical Congress, an organization founded in 1871, declared that only one more great geographical challenge remained: the exploration of Antarctica. They urged scientific societies throughout the world to take up the challenge, and in response no fewer than 16 Antarctic expeditions were launched before the start of World War I. On December 14, 1911, the Norwegian Roald Amundsen and his men reached the South Pole, bringing to a close an era of exploration and discovery lasting more than 400 years. After planting the Norwegian flag, they returned to their tent and celebrated with cognac and cigars.

—James H. Overfield

Explorations of Africa

Prior to the nineteenth century, the interior of Africa was largely unknown to Europeans. Small colonies and trading posts dotted the coastline, but there was little incentive or desire to move inland. This began to change in the early nineteenth century for several reasons. The prevalence of Enlightenment ideals spurred a desire to comprehend the world, and the increasing prestige of science made ignorance of the interior of Africa intolerable. Another important impulse was the increasing tempo of missionary work, as missionaries sought to bring Christianity and civilization to the inhabitants of Africa. Perhaps paramount, the exploration of Africa opened the possibility of increased trade and commerce. These motives

intermingled with each other and provided a strong impetus for the exploration of Africa.

The beginning of European exploration of Africa is often dated from 1788, when a dozen wealthy Londoners founded the Association for Promoting the Discovery of the Interior Parts of Africa (known as the African Association), committed to discovering the origin and course of the Niger River and the location of the city of Timbuktu, the “lost city” of gold. The members of the organization were motivated by a desire to advance scientific knowledge and to end the slave trade, but the founders also were interested in commercial opportunities. Although explorers sponsored by the association never reached Timbuktu (this was accomplished by a major in the Royal Navy, Alexander Gordon Laing, in 1826), the Scotsman Mungo Park was the first European to view the Niger River in 1796. His *Travels to the Interior Districts of Africa* (1799) was translated into several languages and was widely read.

Among other early European explorers were the German missionaries Johannes Rebmann and Ludwig Krapf, the first Europeans to see Mount Kilimanjaro and Mount Kenya, in the late 1840s, and another German missionary, Heinrich Barth, who explored the Sahara. At the same time, the British missionary David Livingstone began his exploration of southern Africa, which included crossing the continent from west to east and traveling the Zambezi River. An important goal of European explorers was the discovery of the source of the Nile River. The expedition of Richard Burton and John Speke led to the European discovery of Lake Tanganyika and Lake Victoria in 1858, and on a later expedition with James Grant, Speke came to correctly believe that Lake Victoria was the source of the Nile. This claim remained disputed for some time, however, and Livingstone spent his last years in Africa searching for an alternative source of the Nile. Other important expeditions included those of the German Gerhard Rohlfs, who in 1867 traversed the Sahara to become the first European to cross Africa from the Mediterranean to the Gulf of Guinea; Germans Gustav Nachtigal and Georg Schweinfurth, who explored Sudan and central Africa; and Mary Kingsley of Britain, who explored parts of West Africa in the 1890s.

DAVID LIVINGSTONE

David Livingstone (1813–1873), perhaps the most famous European explorer of Africa, was a British missionary sent to southern Africa in the early 1840s by the London Missionary Society. He was soon drawn into the interior of central Africa in furtherance of his missionary work, and his explorations of the 1840s and early 1850s included becoming the first European to see the Victoria Falls. His discoveries made him famous and helped popularize the cause of African exploration and the bringing of civilization to the continent. He later focused on determining the source of the Nile River. During this journey he lost contact with the outside world, leading to his famous discovery by the reporter Henry Stanley in 1871, with the words “Doctor Livingstone, I presume.” Livingstone died two years later in Africa, still searching for the source of the Nile.

—Wesley Ferris

The initial European explorations of Africa were not directly linked to attempts by the Great Powers to gain new colonies on the continent, but the mapping of Africa did facilitate subsequent colonization, and some explorations of the late nineteenth century were closely related to efforts to expand European territory. This link was epitomized by the later explorations of Henry Stanley, who in the late 1870s solved one of the last great mysteries of African exploration by tracing the course of the Congo River to the ocean. This opened up the Congo to Europeans, and Stanley was later to play an important role in organizing the Belgian colonization of the region. By the end of the nineteenth century the exploration of Africa had been completed, and the knowledge thus gained proved vital in the colonization of the continent before the First World War.

Explorations in Central and Southwestern Asia

Dormant and secluded during much of the early modern period, the vast region of central and southwestern Asia located between the 30th and 40th parallels, from Persia to Mongolia, recaptured the Western world's interest in the late eighteenth century when the region became

the world's last imperial frontier. Exploration played a central part in the complicated ballet of diplomatic maneuvers and military intimidation. Adventurers by nature, the explorers were trained as veterinarians, cartographers, archaeologists, businessmen, soldiers, ethnographers, geographers, and even spiritual leaders. They assembled impressive expeditions through immense hostile regions. Relying on extraordinary survival skills, strength, resiliency, and boldness, they navigated in and out of business, academia, adventure, politics, and public opinion. Their actions brought central Asia to the world's attention and shaped imperial ambitions.

By the time of the Russo-Persian Treaty of 1813, Britain and Russia were locked in a rivalry that lasted until the Anglo-Russian Convention of 1907. The first encounters took place in western central Asia. In 1812 the British East India Company sent William Moorcroft (1770–1825) to Bokhara to look for equine stock. Moorcroft continued without permission to Tibet, gathered fauna and flora specimens, and returned with maps and a theory of Russian imperial expansion from Afghanistan to Tibet that would influence British politics for the rest of the century. A second expedition to Bokhara in 1819 ended his career in the company after he initiated an unauthorized alliance proposal with the ruler of Ladakh to secure Kashmir, a region that Moorcroft considered a vital east-west trade link. He continued his explorations from Kashmir to Bokhara until his death in 1825, together with the young geographer George Trebeck (1800–1825). Alexander Burnes (1805–1841) followed in Moorcroft's footsteps to Bokhara and Tehran in 1832, exactly when the Russians, who had been trading furs, woolens, and cotton with central Asia since 1559, were moving closer to Afghanistan. Burnes became a victim of the first Anglo-Afghan War in 1841 along with explorer and intelligence officer Arthur Conolly (1807–1842), who coined the term "The Great Game" to describe the British-Russian rivalry.

After a lull of 20 years, explorers resumed their efforts east of Lake Balkash, in present-day Kazakhstan, following Russian exploration and expansion in eastern central Asia, from Tibet, which the Chinese had closed off to foreigners in 1792, to Mongolia. The exploration of the Ussuri

River by Russian geographer Nikolai Przhevalsky (1839–1888) and his four expeditions in the 1870s and early 1880s, from Turkestan and Mongolia to Dzungaria, Quinghai, and Tibet, pioneered a new era in the study of the geography, fauna, and flora of central Asia. Interpreting the Chinese hold on Xinjiang and Tibet as weak, Przhevalsky encouraged the Russian government to conquer both. Russian archaeologist Pyotr Kozlov (1863–1935) continued his work by mapping the Gobi desert. Politics mixed with exploration in yet another way when Sir Francis Younghusband (1863–1942), a British army officer, explorer of Manchuria and Gobi, and nephew of explorer Robert B. Shaw of eastern Turkestan fame, met with his counterpart, Russian Captain Bronislav Gromchevsky (1855–1926), in northern Pakistan in 1889.

The post-1860 explorations were systematic, scientific, and international. Sponsored by geographic societies, Oriental studies institutes, and assorted museums, explorers enjoyed unprecedented fame. Their feats were publicly rewarded, and their travelogues became instant best-sellers. Swedish geographer, topographer, and photographer Sven Hedin (1865–1952), although apolitical before World War I, was financed by the Swedish Geographic Society, used research assistants and local scientists, traveled under Russian protection, and visited Beijing to consult Chinese scholars. This acclaimed European explorer conducted three major expeditions between 1894 and 1908 to central Asia and mapped 65,000 square miles (168,350 square kilometers) of "white spaces." With Lhasa as his goal, he first went to Tibet through the Pamir mountains, across the Taklamakan desert to the lost city of Khotan. On his second expedition he mapped the "wandering lake," Lop Nor, and found the ruins of Lulan and its artistic treasures. A new era was born.

By the early 1890s, the region between Tibet and Mongolia was attracting an increasingly diverse set of individuals. Diplomat and ethnographer William Rockhill (1854–1914), U.S. envoy to China in 1884, conducted two expeditions to Tibet and Mongolia, in 1888 and 1891, making numerous ethnographic and geographic notations. British explorers, notably A. D. Carey, were exploring the same areas. Central Asia had become fashionable and was attracting celebrities. The intrepid British painter, ethnographer,

and explorer Arnold Henry Savage (1865–1924) went to Tibet twice, in 1897 and 1903–1904, and, having survived Tibetan capture and torture, became an acclaimed lecturer and writer. The future Nicholas II (1868–1918) met with central Asian personalities during his 1891 Asian trip, including the leader of the Theosophical Society, Madame Blavatsky. A cousin of Russian railroad magnate and finance minister Sergei Witte, Blavatsky influenced several explorers to search for the mythical city of Shambala, a Buddhist Pure Land that would be the ideal place to establish a universal brotherhood of humanity. Even Younghusband was not immune to the spiritual quest of attempting to bridge Christianity with the Hindu and Buddhist religions.

Sir Aurel Stein (1862–1943), an Austro-Hungarian scholar and mapmaker, most clearly represents the transition from exploration to archaeology. Searching for lost cities from Taklamakan to Chinese Turkestan, he discovered the Mogao caves of Dunhuang and bought or seized thousands of Buddhist manuscripts. Having excavated a perfectly preserved stupa at Khara-Khoto in 1908–1909, Pyotr Kozlov sent thousands of documents and artifacts to St. Petersburg. Russian and German archeologists teamed up between 1898 and 1903 under the leadership of Dmitri Klementz (1847–1914), head of the Ethnographical Museum in St. Petersburg. British, French, American, and Japanese archeologists, sponsored by their national geographic societies, Oriental studies institutes, and assorted museums, descended upon central Asia. Before the Chinese government could react, Xinjiang was plundered in the first decade of the twentieth century.

The scramble for antiquities was accompanied by one last entanglement between explorers and politicians over Tibet. Kozlov obtained an audience with the Dalai Lama in 1905. Rockhill, at the turn of the twentieth century, initiated a century of U.S. involvement in Tibet with President Theodore Roosevelt's blessing, became an adviser to the Dalai Lama, and was instrumental in the Dalai Lama's submission to China in 1908. In the years before World War I, however, the search for control of energy and raw materials took the world's attention away from central Asia. From Caspian Sea oil to Manchuria's ores, resources located at both ends of

THE LASTING CONTRIBUTIONS OF NINETEENTH-CENTURY EXPLORERS IN ASIA

The discoveries made by nineteenth-century explorers in central and southwest Asia became familiar concepts, values, and landscapes during the twentieth and twenty-first centuries. We owe the discovery of the Khyber Pass, the Indo-European migration theory, rhubarb, and the improved manufacture of Cashmere shawls to William Moorcroft. The only extant race of wild horses, the Przewalsky horses, owes its name to Nikolai M. Przewalsky. German geographer and China expert Ferdinand von Richthofen (1833–1905) coined the term "Silk Road." Sven Hedin found the sources of the Brahmaputra and the Indus rivers. Thanks to Sir Marc Aurel Stein, we are aware that Buddhism spread from India to China via the Silk Roads, and we learned about ancient Indian medicine and necromancy. Madame Blavatsky's Theosophical Society ushered in a new spiritual understanding between East and West and pioneered the baby boomers' spiritual pilgrimages to Katmandu and Calcutta. William W. Rockhill established a scholarship fund for Chinese students in the United States and predicted one century early the creation of a Pacific Rim economy and the interest of the United States in China. Alfred T. Mahan (1840–1914), the American prophet of naval power, predicted one century early the growing U.S. interest in China and the importance of reopening the Silk Roads. Even the future Russian tsar Nicholas II took a trip through central Asia in 1891 and met with the Who's Who of the Silk Roads explorers.

—Alice-Catherine Carls

the Silk Road, near the seashores, attracted the Great Powers. The maritime age would last for another century, and central Asia would again be secluded until the end of the Cold War.

Western Travelers and Explorers in Southeast Asia

Southeast Asia was the site of long-distance travels by Southeast Asian traders and mariners, as well as, Chinese, Indian, Arab, and Persian merchants, pilgrims, and diplomats long before the arrival of significant numbers of Europeans. Their chronicles, along with those of the illustrious European observer Marco Polo (1254–1324) in the late thirteenth century, all provide information about the region. Information increased appreciably from the time of the Portuguese and Spanish voyages of discovery in the sixteenth century, then from Dutch, English, and French sources in the seventeenth and eighteenth centuries.

Only from the 1850s onward, however, do we witness a surge of European exploration and travel in Southeast Asia. Some travelers experienced only brief encounters with what to them were strange peoples and places. There were those who came for a longer sojourn in the region; some, such as colonial administrators, traveled extensively in their assigned districts. Other Europeans embarked on journeys of exploration to increase scientific or geographical knowledge; to open up remote populations to commerce; to map, survey, and fix territories and boundaries; or to pacify so-called untamed tribes and plant the flag in unclaimed terrain.

Very often, superficial encounters were made in the context of maritime trade and discovery. Good examples are the English navigator Thomas Forrest's visit to Brunei in 1776 and the adventurer Erskine Murray's attempt to establish a British presence in the sultanate of Kutai on Borneo's east coast in 1844. The writer Joseph Conrad's description of his visit to Indonesia's Bangka Island in 1883 is similar. Accounts of residence in Southeast Asia and brief excursions from home bases are numerous. The most famous such sojourner was Anna Leonowens (1831–1915), the British travel writer, educator and social activist, who worked in Siam from 1862 to 1868, where she taught the wives and

children of King Mongkut. Her experiences were turned into a bestselling novel in 1944 by Margaret Landon, *Anna and the King of Siam*, which inspired films, television miniseries, and most notably, Rodgers and Hammerstein's 1951 hit musical *The King and I*.

Among the most famous of the nineteenth-century explorers was the Frenchman Francis Garnier (1839–1873). Appointed in 1862 as the official in charge of Cholon, a city in the recently established French colony of Cochinchina, Garnier with his colleague Doudart de Lagrée (1823–1868) and four other Frenchmen, was the first European to explore the Mekong River basin from its delta in South Vietnam to its headwaters in southern China in 1866–1868. Another notable French explorer was the naturalist Henri Mouhot (1826–1861). Although he was not the first European to discover the ruins of Angkor Wat, he did bring them to the attention of a European audience in his posthumously published *Voyage dans les royaumes de Siam, de Cambodge, de Laos et autres parties centrales de l'Indochine* (1863–1864).

In other parts of mainland Southeast Asia, Sir J. G. (George) Scott (1851–1935) is among the best-known explorers. He traveled over much of the eastern borderlands of Burma in the late 1880s and early 1890s to conclude treaties and alliances with local rulers, to undertake mapping and surveying, and to fix territorial boundaries between the British, French, Thai, and Chinese possessions in this region. The Norwegian natural scientist Carl Bock (1849–1932) secured a reputation for adventure and travel in several locations in Southeast Asia, and provided some dramatic descriptions of “savage” and “exotic” peoples and customs. He was commissioned by the governor-general of the Dutch East Indies to explore southeastern Borneo in 1879–1880, after his zoological collecting trip to Sumatra in 1878. He subsequently traveled independently through Siam and Laos in 1881–1882. Also important was the extended journey of the great English naturalist and evolutionist Alfred Russel Wallace (1823–1913), who spent an extraordinary eight years of scientific discovery (1854–1862) in the islands of Indonesia, during which time he collected more than 125,000 natural specimens.

European Explorers in the Pacific

In the wake of Ferdinand Magellan's famed circumnavigation of the globe between 1519 and 1522, numerous others sailed across the vast expanse of the Pacific Ocean, first sighted by Balboa in 1513. These included Alvaro de Mendana (1567-1569), the Spaniard who mapped the Solomon Islands; Sir Francis Drake (1577-1580); and Pedro Fernández de Quiros, another Spaniard who (with Mendana in 1595-1596 and Luis Vaez de Torres in 1605-1606/1607) made landings on the Marquesan and Tuamotu islands and discovered the Torres Straits, the body of water between Australia and New Guinea. From then on the Dutch prevailed. Jakob Le Maire and Willem Schouten in 1615 sailed across the Pacific, threading their way through the Tuamotu archipelago and on to Samoa and the Moluccas, finally reaching Jakarta in 1616. In 1642 Abel Janszen Tasman sighted present-day Tasmania and reconnoitred the Western coast of New Zealand for the first time. Jacob Roggeveen in 1721 discovered Easter Island on his journey across the Pacific. Almost all thought that they had at one point or another caught sight of a southern continent.

The exploration of the Pacific Ocean gained momentum in the closing decades of the eighteenth century as the geopolitics of European

empire building altered. The complex web of European alliances, the defeat of the French in the Americas in 1763, and the triumph of British naval power were all important factors. Equally important were Enlightenment ideals based on the pursuit of knowledge. Exploration was also a matter of science, as botanists, artists, mathematicians, and astronomers took to the seas with explorers such as Louis Antoine de Bougainville, James Cook, and Jean-François de Galaup, Comte de Lapérouse.

George Anson (during 1740-1744) and John Byron (during 1764-1766) sailed around the world with these geopolitical strategies in mind. Anson, in the *Centurion*, was instructed by the British Admiralty to sail around Cape Horn with a squadron to undercut Spanish commerce on the Western South American coast and to attack Spanish settlements. Extremely bad weather, the scattering of his fleet during the passage through the straits and in the Pacific, and illness and death on board made any such initiatives immediately impossible. After several months of respite at Juan Fernandez, Anson pillaged Spanish ships from the South American coast to China with huge success for three years. He arrived at Spithead on June 15, 1744, after unknowingly escaping a French attack in the channel due to fog.

Commodore John Byron left England in June 1764 in the frigate *Dolphin* and with the sloop *Tamar*, captained by Patrick Mouat. Byron's instructions from the Admiralty made it clear that he was to comb the South Atlantic from latitudes 33° to 53°, to pinpoint Pepys' Island and the Falkland Islands. Because, as his instructions noted, they had not been "sufficiently surveyed as that an accurate judgment may be formed of their coasts and product," he was to do so to secure a foothold in the South Atlantic to ensure future exploration of the Pacific. He was then to sail north up the American coast in the age-old search for the route linking the Pacific to the Atlantic (more commonly known as the Northwest Passage). After taking possession of the Falklands in the name of the king, Byron concluded that his ships were in no condition to take up the California trek specified in the instructions and instead sailed around the Cape and continued across the Pacific in search of the Solomon Islands. He sailed home across the Pacific

➤ A EUROPEAN VIEW OF TAHITI IN 1768

“As soon as we had moored, the ship was surrounded by a great many canoes several in which there were women. After the free and friendly manner of a number of our men, one of the island women ventured on board with an old man and some of her countrymen. She was tall and well-made. In her colour she was as white as any Spanish lady might wish.

Many of our luxurious men, plainly destitute of provisions for such many months, were uncommonly longing. They came presently near, looked, admired and touched. Soon, the flimsy veil which concealed the lures from their eyes in honour of modesty which may perhaps be condemned, was torn away and more readily it is true to say by the Indian nymph goddess herself than by our men. She was plainly only true to the employments of her country which alas the corruption of our practices have banned from our own.

What hand could render with sufficient nicety the discovery of the marvels uncovered by

this veil having fallen away so happily? A retreat which was in honour only of Love itself. Our eyes met hence with an enchanting dell that this God had surely created Himself. Our senses were excited to the utmost degree and a burning warmth seized upon our minds, we were consumed.”

heading west and then through the atolls of the Tuamotu archipelago, discovering Takaroa and Takapoto and sighting Rangiroa. He was back in England by May 1766.

In the wake of these and other British voyages, other European nations began sending ships on missions to explore the Pacific Ocean with more explicit hopes of seeking out the Terra Australis Incognita. Thus, Byron’s voyage was followed in 1766 by that of Captain Samuel Wallis in the very same *Dolphin* accompanied by the *Swallow*, captained by Philip Carteret. The British Admiralty’s instructions to Wallis were to “discover and obtain a complete knowledge of the Land or Islands supposed to be situated in the Southern Hemisphere.” Wallis discovered the Society Islands, Tahiti, and the self-named Wallis Island and claimed that he had caught a glimpse of a large landmass, possibly the Southern continent. The *Dolphin* and *Swallow* lost sight of each other in the Straits of Magellan, and Carteret continued southward across the Pacific alone, discovering and naming Pitcairn Island on which the *Bounty* mutineers took refuge in 1790. Carteret arrived in England in 1769

after having been overtaken by the French vessel *La Boudeuse*, commanded by Louis-Antoine de Bougainville. In October 1766 Louis XV of France had sent Bougainville on a voyage around the world with the storeship *Etoile*, captained by Chesnard de la Giraudais. Both ships proceeded to the Pacific, where they were to map and take possession of any islands they might discover. The expedition made no major discoveries, and Bougainville came to doubt the existence of the *continent austral* during the voyage, which ended in 1769.

The exploration of the Pacific nevertheless continued. The most successful of these explorers was James Cook, who made his first voyage to the Pacific (1768–1771) in the *Endeavour*, ostensibly to observe the transit of Venus over the sun at Tahiti. The Admiralty’s secret instructions, however, made it clear that Cook was to determine the existence of a vast continent in the Pacific by sailing as far south as possible. After leaving Tahiti he sailed to latitude 40° 22' and concluded that it was unlikely that any great landmass might be nearby. He sailed on to New Zealand, where he disproved the theory that

New Zealand was the northernmost point of the Southern continent. Cook went on to map the eastern coast of Australia in 1770. Cook sailed through the Torres Straits, arriving home in July 1771 to great acclaim.

In 1772 Cook set off again with essentially the same objective. Cook sailed south of the Cape of Good Hope and reached the Pacific in early 1773. After he completed a return voyage from New Zealand to Tahiti, his ship the *Resolution* set off on a second loop in November 1773 to explore the southern extremes of the Pacific Ocean between New Zealand and Cape Horn. Cook reached latitude 71° 10' and concluded that any continent south of this latitude would be nothing more than a frozen, almost inaccessible waste stretching to the South Pole.

Cook then turned north. He stopped off at Easter Island, rediscovering the Marquesas (not visited since the sixteenth century), discovered and mapped the Palliser Islands, and charted the New Hebrides. He discovered New Caledonia, the Isle of Pines, and Norfolk Island (later an ill-famed penal colony) and was back in New Zealand in October 1774. On the final leg of this voyage he sailed more or less straight across the Pacific Ocean to the South American coast to cover any ground he may have missed. This voyage finally laid to rest the myth of a Terra Australis and established the geographical limits of the Pacific. Cook was back in England in July 1775.

Cook's last expedition to the Pacific in the *Resolution* and the *Discovery* (captained by Charles Clerke) in 1776 had as its goal the discovery of the Northwest Passage into the Atlantic from the Pacific Ocean. He stopped off at Tahiti and then sailed into the North Pacific, discovering Christmas Island and the Hawaiian archipelago (Sandwich Islands) in January 1778. He pushed far north to latitude 70° 44' and surveyed the coasts in search of a passage into the Atlantic. Failing to find the Northwest Passage, he decided to head for the Sandwich Islands to make repairs on the *Resolution*. In January 1779 the Hawaiian archipelago was once again in sight, and Cook was received there as a deity. He set sail on February 4 but had to return on February 11 after a storm. Relations were less cordial this time. On February 14 Cook was killed onshore by Hawaiians.

Of the major Pacific archipelagos, only Fiji remained to be discovered. Another Englishman, William Bligh, discovered these islands during his incredible voyage in an open boat across half of the Pacific Ocean following the mutiny on the *Bounty* in 1789. By the end of the eighteenth century, the boundaries of the Pacific Ocean had been mapped. French navigators Jean François de Galaup, comte de La Pérouse (who lost his life in the Pacific in 1785), Antoine Raymond Joseph de Bruni D'Entrecasteaux along with Jean-Michel Huon de Kermadec in 1791–1793, and Etienne Marchand in 1790–1792 continued efforts to pinpoint archipelagos and dispel myths. The existence of the Northwest Passage between the Atlantic and the Pacific remained a remote possibility. However, George Vancouver's four-year voyage during 1791–1795 settled the question: there was no easy maritime route from the North Pacific to the Atlantic.

The Mapping of Australia, Tasmania, and New Zealand

By 1750 Dutch encounters with Australia, going back to the initial discovery of the north coast of Australia in 1606 by Willem Janszoon, had yielded maps of the continent's west coast and part of the southern coast, a region marked on European maps as New Holland. In addition, the Dutchman Abel Tasman had mapped the southern coast of Tasmania and a small section of the west coast of New Zealand during voyages in 1642 and 1644. However, these encounters indicated that these regions held nothing of value. Thus, it was not

► COOK'S 1770 MAP OF NEW ZEALAND

Cook's map of New Zealand, constructed during his 1769–1770 *Endeavour* voyage, is very accurate even though he had no chronometer to help calculate longitude. The map does contain some errors (Banks Peninsula is shown as an island, Stewart Island as a peninsula), but it remained the standard map of New Zealand for nearly 80 years.

The track of the *Endeavour* is marked on the map, showing the way that Cook's voyage was at the mercy of currents, waves, and weather. The map also shows the influence of Tupaia, Cook's Tahitian passenger. Tupaia was able to communicate with the Maori, and the map shows Maori names for some features, including the two main islands.

until the eighteenth century that further mapping was undertaken by Europeans. Captain James Cook (1728–1779), commissioned by the Royal Society of London to sail to the Pacific to observe and record the transit of Venus across the sun, is well known for his accurate maps of New Zealand and the eastern edge of Australia, drawn in 1769 and 1770. Cook made a close circumnavigation of New Zealand, destroying any hope that it might be part of the Southern Continent. He named the eastern region of Australia New South Wales and claimed the region for Britain. He spent eight days anchored in Botany Bay, the area of Australia that became a British penal settlement and eventually the city of Sydney.

A British penal colony was established in Sydney in 1788 even before the outline of the continent was known. After the founding of Sydney, the mapping of the Australian, Tasmanian, and New Zealand coastlines advanced quickly, in part because Sydney provided a European base in the region and in part because Sydney's very existence inflamed Anglo-French rivalries. In 1797 an expedition from Sydney led by Matthew

Flinders and George Bass determined that Tasmania (Van Diemen's Land as it was known until 1856) was an island separated from the mainland of New South Wales. Flinders went on to complete the first close circumnavigation of the Australian continent between 1801 and 1803. In the process, he destroyed the widely held belief that New South Wales was a separate landmass from New Holland and that there was a strait between them that would provide an easy route from Sydney to Asia. During this period French exploration of the Pacific region also increased. In 1802 Flinders met Frenchman Nicholas Baudin's expedition in Encounter Bay off the south coast of Australia. Baudin was also engaged in the search for a strait and in the mapping of the New Holland/New South Wales coastline.

The coastlines of Australia, Tasmania, and New Zealand were mapped well before the interiors. The settlers at Sydney only succeeded in crossing the Blue Mountains, a range that begins approximately 70 miles (113 kilometers) to the east of the city, in 1813. Previously they had been restricted to a small coastal region, as

Australia's Great Dividing Range (which includes the Blue Mountains) shut the eastern seaboard off from the continent. While Australian explorers from both the east and west were lured inland by hopes of finding great rivers or an inland sea, Australia's arid conditions made exploration and mapping of the interior extremely difficult even after coastal settlements had been established. Settlement and mapping continued up to and beyond 1914, particularly in the eastern parts of Australia, but large sections of the continent remained unmapped because of the difficulties of desert travel. Australia's vast interior was eventually mapped from the air beginning in 1930.

The mapping of the interiors of Tasmania and New Zealand was easier because they are smaller and less arid. The mapping of Tasmania was largely complete by 1848. The mapping of New Zealand was helped by the ability of explorers to communicate with all inhabitants of New Zealand using the Maori language, but in the North Island it was hampered first by war and then by deliberate resistance to surveying (including the destruction of survey markers). In New Zealand, as in Australia, mapping followed settlement, but it was completed by 1895.

Polar Expeditions

Before the nineteenth century, economic considerations drove most of the initial explorations of the northern polar region by Europeans, as intrepid ship captains hoped to find a way to penetrate Asian markets by a shorter route. In the nineteenth century, polar expeditions gained a quasi-scientific status because of the thrill of discovering new resources and the true geographic

and magnetic poles. By the twentieth century, the marriage of science and adventure was encapsulated by such expeditions to study the relatively unknown geologic, oceanographic, climatic, and meteorological conditions at the poles. Although most scientific expeditions were undertaken under national auspices with strategic or propaganda objectives in mind, they often served the interests of science as well.

The thrill of adventure brought polar expeditions into public consciousness, and expedition leaders became heroes. Many scientists were drawn to the expeditions, including the founder of the theory of continental drift, Alfred Wegener (1880–1930), who died on the Greenland Ice Sheet in 1930. The American Robert Peary (1856–1920) made celestial and magnetic observations on his journey to the North Pole; when he reached it in 1909, he proclaimed that he had finally gotten the North Pole out of his system. He became an instant celebrity and disappointed the hopes of other nations to achieve this “first.” However, historians have pointed out defects in his scientific observation techniques; indeed, some have suggested that these defects help to show that Peary never really reached the pole at all and fell short by 100 miles (160 kilometers).

With the North Pole evidently reached, the South Pole on the continent of Antarctica became the next objective. In fact, Peary's announcement spoiled the plans of the Norwegian Roald Amundsen (1872–1928) to reach the North Pole. Amundsen quickly revised his plans and headed south, where a British expedition led by Robert Scott (1868–1912) already was planned. Amundsen argued that because the British claimed to be conducting scientific research, he did not believe that there was a competition. But the scientific elements of the expedition, in Britain as well as in Norway, were secondary to achieving the goal of being first. In this case, the famed competition between the Norwegian and British teams ended in tragedy. Amundsen's team was first to reach the pole, in 1911, and returned alive. Scott's team arrived at the pole 34 days later, finding the remnants of Amundsen's camp. The entire party died on the return trip in 1912.

In popular culture, polar explorers were the great national heroes of their time, combining

After reaching the North Pole, American Robert Peary became an instant celebrity. However, historians have pointed out defects in his scientific observation techniques and some have suggested that these defects help to show that Peary fell short of reaching the pole by a hundred miles. (National Oceanic and Atmospheric Administration)

virile endurance with scientific discovery. In 1914 Irishman Ernest Shackleton (1874–1922) embarked on an expedition to cross the Antarctic, but in 1915 his ship was caught in the ice and crushed. For five months he and his men survived and became British celebrities for their endurance. In 1926 Richard Byrd (1888–1957) became a U.S. celebrity for flying a plane to the North Pole. In 1937 Soviet pilot Valerii Chkalov (1904–1938) became a celebrity (in his own country) for being the first to fly over the North Pole from Moscow and land safely in the United States (in the state of Washington), breaking the nonstop long-distance flying record. That same year Mikhail Gromov (1899–1985) followed up by making the same journey and landing in California.

Scientific study received less attention from the press than did exploration. Anthropologist Vilhjalmar Stefansson (1879–1962), for example, began a series of ice floe experiments and other explorations in the Canadian Arctic around the time of these more widely known efforts in Antarctica. His studies yielded a great deal of knowledge about the environment of the arctic and its peoples, but his fame paled next to the explorers.

Scientific research often entailed international cooperation rather than competition. In 1932–1933 several countries organized the Second International Polar Year (the first was held 50 years earlier), designed to have numerous scientists take similar measurements in various places at roughly the same time. Magnetic, aurora, and meteorological observations dominated the scientific work during the Polar Year, conducted by a network of stations in the Arctic and Antarctic. The International Meteorological Committee, which planned much of the year, hoped that the scientific work would have practical applications related to terrestrial magnetism, marine and air navigation, wireless telegraphy, and the forecasting of weather.

Lewis and Clark Expedition, 1804–1806

Even before the Louisiana Purchase in 1803, U.S. president Thomas Jefferson had begun preparations for an overland expedition to the Pacific Ocean by seeking the advice of prominent scientists and naturalists on possible areas of focus for such an expedition. Each was also asked to tutor Meriwether Lewis (1774–1809), President Jefferson's personal secretary and the man he had selected to lead the anticipated westward expedition. As Jefferson's personal secretary, Lewis had been privy to the highest levels of domestic and diplomatic information regarding the Western lands, and like Jefferson, was convinced of their geopolitical importance. On January 18,

1803, Jefferson sent a secret message to Congress calling for an expedition to explore the West by following the Missouri River to its headwaters, portaging the mountains, and following the Columbia River from its headwaters to the Pacific. It would fill in the unknown “middle” of the West, an area that was still a mystery to cartographers.

After Congress agreed to fund the Corps of Discovery that was to explore the West, Jefferson completed the purchase of Louisiana Territory from the French in May 1803. Lewis, having been selected to lead the expedition, was charged with preparing the Corps by securing the party of explorers, creating a budget, preparing a list of needed supplies, and setting a schedule. One of his first decisions was to recruit his friend William Clark, with whom he had served in the U.S. Army, to join the expedition as a co-leader. Lewis made an effort to get a captain's position for Clark, but Secretary of War Henry Dearborn refused his request. Although Lewis and Clark have been recognized as equals in their leadership of the Corps of Discovery, officially, this was not the case.

Before embarking, Lewis designed a boat made of an iron frame with animal hides that he believed would be especially useful in the “short portage” across the mountains. Lewis had also designed a special flatboat for use on the Missouri. It had front and rear cabins, with sides that could be raised in the event of an attack by Native Americans. Once these vessels were constructed, Lewis joined Clark at St. Louis to begin the mission. After they witnessed the formal exchange of the upper part of the Louisiana Territory at St. Louis on March 10, 1804, Lewis and Clark and their group of 33 men aboard one flatboat and two pirogues set out on May 14.

Travel upriver at first was difficult. The flatboat often ran aground on sandbars or became caught on underwater snags, and the men had to lift the boat or empty and reload its cargo to free the vessel. Along certain stretches, they had to pull the boats upstream with huge ropes that they dragged along the riverbanks. Once the expedition went beyond the junction of the Platte River, it entered Native American territories. By August 1804, the expedition reached the camp of the Oto tribe, where Lewis made a speech to the members of the tribe at a powwow. Lewis

told them that the party came in peace. He also informed them that the Spanish father was now gone, and hereafter the Great White Father in Washington would be their leader. He then smoked the calumet and distributed presents to the tribe.

Farther up the Missouri, the Corps encountered the Sioux, who were considered to be the scourge of the Upper Missouri. They lived near enough to Canada to be under the economic spell of British gifts and trade goods. Viewing the Americans as intruders, they gave them a cold reception and showed their displeasure at the quality or quantity of the Americans' presents. When it appeared the Sioux warriors might begin hostilities to prevent the further advance of the Americans, Lewis and Clark made clear they would continue their journey westward.

When not dealing with Native Americans or maintaining discipline among their crew members, Lewis and Clark spent much of their time collecting samples of the flora and fauna. Lewis found fossils and collected geological samples to send back to Jefferson. As the winter of 1804 approached, the Corps neared the village of the Mandan in the Dakota region, where the Americans were well received. Here Lewis and Clark met the French Canadian Toussaint Charbonneau and his indigenous wife, Sacagawea. Both joined the Corps when the group left the Mandan village in the spring after a harsh winter in which Lewis and Clark sent out hunters to kill game for the Americans and the Mandan alike.

When the expedition departed on April 7, 1805, it entered unknown territory. The corps continued up the Missouri River, and when the river seemed to split where the Marias and Missouri rivers join, members of the expedition divided into smaller groups, hoping to locate the Great Falls of the Missouri. Not finding this landmark within a day, they decided that the South Fork of the Missouri was the main branch they should follow. After reaching Great Falls, it took the corps 24 days to portage 85 miles (137 kilometers) around the falls and the steep canyon country that followed. Once beyond the Great Falls, the Corps returned to the river for transportation. At this point, Lewis had to accept the failure of his much-acclaimed collapsible

iron-and-hide boat, which proved useless when tested. As the expedition reached the headwaters of the Missouri River, members of the Corps spotted hunters from the Shoshoni tribe, who advised them as to the best route across the Rocky Mountains. With this information, the expedition crossed the Continental Divide at Lemhi Pass (in present-day Montana) on August 12, 1805.

After the difficult crossing, the Corps came upon the Shoshoni (or Snake) village where one of the miracles of the expedition took place. Sacagawea discovered that the Shoshoni chief was her brother Cameahwait, whom she had not seen in the four years since she had been kidnapped by the Hidatsa (who later sold her to the Mandan tribe). Upon seeing his sister, Cameahwait was deeply moved, and he helped the Corps by providing horses and other provisions. Having crossed the Bitterroot Mountains, the expedition followed the Snake River until it reached the Columbia River, which it followed until reaching the Pacific Ocean on November 8, 1805.

After constructing Fort Clatsop at the mouth of the Columbia River, the expedition wintered over, and then in March 1806, began its journey home. On reaching the western base of the Rocky Mountains, members of the Corps divided into two parties to explore a larger area and find the easiest passage across the mountains. The parties were to rejoin at the falls of the Missouri. During this phase of the expedition Lewis's party encountered hostile members of the Piegan Blackfoot tribe, who attempted to steal their guns and horses. Shots were fired, and two Native Americans were killed—the only indigenous casualties of the entire expedition. On August 11 an accident occurred while hunting. Private Peter Cruzatte fired into some bushes and wounded Lewis. Although the flesh wound

to his leg was painful, Lewis survived, and during his recovery, Clark assumed command.

On September 23, 1806, the Corps made its triumphant return to St. Louis. The members of the expedition were feted as heroes, having achieved a feat that many had believed was impossible. The Lewis and Clark Expedition strengthened the U.S. claim to the Louisiana Territory, and also provided a basis for a claim to the Oregon country, that in 1846 would be divided with Great Britain by a diplomatic agreement. The expedition provided a wealth of information about the flora, the fauna, and the ethnography of the West. The travels of Lewis and Clark also expanded our collective geographical sense of the West by providing accurate maps that confirmed the vastness of the region. The expedition also disproved certain mythic falsehoods, such as the incredible hope that an easy, all-water route to the West might exist.

■ Introduction: Travel and Tourism

In the period from 1750 to 1914, the development of railroad lines, steamships, and telegraphy as well as rising standards of living and financial innovations such as traveler's checks

(introduced in the 1890s) reshaped travel, whether for migration, commerce, exploration, religious pilgrimage, or pleasure. Tourism, previously a privilege confined to elites, became via-

ble for the middle class and workers in the nineteenth century.

Leisurely travel, designed to refresh participants and to take them out of the everyday routine, has its roots in religious pilgrimage. The Hajj, or yearly pilgrimage to Mecca, is one of the basic tenets of Islam. All Muslim males are expected to make the journey at least once in their lives; Tibetan Buddhist tradition also encourages pilgrimages to the four holy sites of the Hearth of Buddhism. Formerly restricted to monks, royalty, and elites, by the seventeenth century numerous Japanese pilgrims including tradesmen, farmers, and merchants dedicated themselves to a several-month pilgrimage on the island of Shikoku, where they made their way on foot for 780 miles (1,300 kilometers) to the island's 88 Buddhist temples. Such travelers, in pursuit of enlightenment, were nevertheless in need of places to stay, provisions, appropriate garb, guidebooks, trinkets, and even comforts such as prostitutes. In India, the first guidebooks to Jain holy sites were published in the seventeenth century. European pilgrimages to Rome, the Holy Land, and various shrines such as Santiago de Compostela and Lourdes also depended on well-established commercial networks, guidebooks, and tour guides.

Tourism dedicated to a secular version of self-improvement emerged with the Grand Tour, a form of cultural pilgrimage common to seventeenth- and eighteenth-century aristocrats, particularly from Britain. Armed with guidebooks, tutors, foreign language study, and trunks, young gentlemen (and ladies with chaperones) set off after their studies for a tour of continental Europe that would last from several months to several years, during which they would mingle in high society in Paris (as well as Versailles and Fontainebleau) and admire the natural beauty of the Swiss Alps, the art and architecture of Italy, the universities of Germany, and then, if funds held out, the art treasures of Holland and Flanders. The young aristocrat on the tour would keep an elaborate journal, correspond, and buy souvenirs.

The new elites who emerged with industrialization hoped to provide their children with similar polish and, to a large extent, took over the routes of the Grand Tour, with travel aided by the development of railway networks,

including railways in colonial realms, and by early travel agencies. In North America a separate circuit developed called the Fashionable Tour that drew elite travelers from the United States and Europe. Such travelers, attuned to the artistic trends that had emerged with romanticism, sought out the picturesque and sublime in landscapes at such locales as Natural Bridge, Virginia; the Hudson River Valley of New York; and Niagara Falls. Like those who took the Grand Tour, these travelers kept elaborate journals and relied on the accounts of elite writers to guide their own experience. For example, high-end travelers to Niagara Falls tried to avoid commonplace views and the masses; to aid them, an entrepreneur created a special shielded staircase that led down to Table Rock so that an aesthete could emerge at this vantage point above the dizzying chasm and experience the sublime. Visiting Table Rock in 1831, the English writer Francis Trollope commented, "Wonder, terror, and delight completely overwhelmed me. I wept with a strange mixture of pleasure and of pain." This intense aesthetic reaction, akin to a religious experience, was one of the chief goals of such tourism. Such travelers were quite different from working-class travelers who also relied on the Erie Canal and railroads to visit Niagara and other nature retreats, enjoy a holiday, or watch tightrope walkers, fireworks, or the celebrated jumper Sam Patch leap into rivers.

As elite travelers' efforts to avoid their plebeian fellow travelers at Niagara Falls indicate, tourism and travel were not simply limited to the wealthy. New train and steamboat networks were sufficiently inexpensive to draw working-class travelers, whether for day trips and picnics or for longer voyages. Steamboat travel in the United States in particular was very inexpensive especially for deck passengers who helped fuel the boats at stops for wood, making long river journeys possible for migrants and workers. Low ticket costs on transatlantic ships also aided the boom in immigration to the Americas of the late nineteenth century. The introduction of second-class rail travel and then, in the 1840s, third-class rail travel in Europe increased ridership on the extensive rail networks of Britain and Europe.

Commuter rail lines, urban horse railways, and later electric trolleys also opened new travel

possibilities. As the era of world fairs began in the 1850s, travel to expositions such as the 1851 Great Exhibition of the Works of Industry of All Nations (or Crystal Palace exhibition) in London or to the Philadelphia Centennial International Exhibition of 1876 became popular with all classes. The spas that harbored the elites gave way to seaside resorts popular with the working and middle classes (with groups of hotels catering to each) and, by the end of the nineteenth century, to amusement parks. In an odd mimicry of the values held dear by elite travelers, some of the first roller coasters were carefully decked out as scenic railways to give passengers the sense of rushing past Alpine mountains, streams, and other glorious scenery.

—Fred Nadis

The Era of the Grand Tour

The era of the Grand Tour is the earliest period of modern leisure travel, that is, travel undertaken for pleasure or edification rather than for work, religious pilgrimage, or other obligation. During this period, running roughly from the sixteenth through eighteenth centuries, British travelers in particular formalized the practice of traveling along planned itineraries in continental Europe with an eye to gaining valuable knowledge and experience. Lasting a year or more, these extended trips were vital in grounding elite claims to culture and class and, in the

long term, in establishing leisure travel as a social rite in the West.

At first it was young and almost exclusively aristocratic British males who undertook a Grand Tour in the period between their university education and their assumption of an office or occupation. The purpose of the journey was to acquaint these young travelers with the European cultural patrimony descending from ancient Greece and Rome. Stops in France and Italy took precedence, the most common itineraries starting in London and moving on to Paris for several weeks and then Geneva before an extended stay in Italy and in particular the cities of Rome, Florence, Venice, Turin, and Naples. As Italy most abounded in both monuments of the classical past and in the art and architecture of the Renaissance, extended time there was considered vital to finishing a young man's education. Over time, Grand Tour itineraries also included shorter stays in smaller Italian cities, time in Germany and the Netherlands, and even some viewing of Alpine landscape as that taste developed in the later eighteenth century.

The conditions encountered on the tour varied from place to place and often could be quite arduous; they also depended upon the resources of the traveler. Even the wealthiest travelers often voiced disgust and disappointment at their experiences along the itinerary. Most commonly, the young man would embark on the Grand Tour with a tutor appointed by his

► EIGHTEENTH-CENTURY ROME—COOL WATER, FILTHY STREETS

Tobias Smollett was one of many English travelers who noted the contrast between the Italian cities' cultural glories of Italy's past and the fetid conditions of their streets and public buildings. The city reeked of "hartshorn," a baker's agent that gave off a strong ammonia smell.

"Nothing can be more agreeable to the eyes of a stranger, especially in the heats of summer, than the great number of public fountains that appear in every part of Rome, embellished with all the ornaments of sculpture, and pouring forth prodigious quantities of cool delicious water, brought in aqueducts from different lakes, rivers and sources,

at a considerable distance from the city. . . . This great plenty of water, nevertheless, has not induced the Romans to be cleanly; their streets, and even their palaces, are disgraced with filth. . . . The corridors, arcades and even staircases of their most elegant palaces are depositories of nastiness, and indeed in summer smell as strong as spirit of hartshorn."

—Patrick Young

Letter of February 28, 1765, by Tobias Smollett, in Tobias Smollett, *Travels through France and Italy, 1766* (New York: Praeger, 1969), 316.

father and with one or more servants in tow. After the Channel crossing, transport was by rented private carriage or by “diligence,” a more public means of transporting larger groups. Lodging options included inns and small hotels of often-dubious condition or, for those capable of affording them, furnished private residences. Once in Italy the tourist would commonly contract with an Italian guide, who made local travel and lodging arrangements and served as translator. Again depending upon the status of the young man’s family, letters of introduction from home might secure access to courts or to meetings with prominent local or expatriate aristocrats. Worldly concerns for improving one’s status and making social and diplomatic connections thus merged in the Grand Tour, with more high-minded ones relating to the refinement of taste and the appreciation of classical culture.

The Revolutionary and Napoleonic wars severely disrupted English travel to the continent, and as the taste for leisure travel gradually filtered down the social order, first in England in the eighteenth century and then on the European continent and in America in the nineteenth, the Era of the Grand Tour began to give way to new forms of travel more appropriate to an industrial middle-class. Limited by time and budget, the traveling middle classes of the nineteenth century still harbored cultural ambitions in their travel, but their train- and guidebook-abetted movements attracted the scorn of writers and seasoned travelers for whom the Grand Tour remained a touchstone for sophisticated travel. The “cultural tourism” of American travelers, often young women accompanied by their mothers in an extended tour of European sites, sustained the tradition of the Grand Tour right up to the outbreak of World War I.

Religious Pilgrimage and the Railroad in India

For millennia, pilgrims from all religions have embarked on sacred journeys across the Indian subcontinent and beyond, but it has only been in the last 150 years that pilgrimage has become a defining religious experience for a large portion of the Indian population. The railroad, a powerful force in transportation since the mid-nineteenth century, greatly affected both the availability and experience of pilgrimage for the entire Indian population. Access to rail-assisted conveyance expedited the inclusion of pilgrimage into the normative practice of religious experience and contributed to the rise of nationalism on the subcontinent.

Over thousands of years, various religious traditions in India—Hinduism, Buddhism, Islam, Christianity, Sikhism—have incorporated pilgrimage to holy sites into their practices. For many individuals, however, long-distance pilgrimage was never an option, as the absence of cash and the long time periods involved in undertaking a pilgrimage (on foot with pack animals) were obstacles not easily overcome. As a result, most individuals—across caste and class lines—completed pilgrimages to holy sites almost exclusively within local areas. For the richest and most mobile groups (large landowners, usually), however, networks of pilgrimage extended throughout the subcontinent and connected them with other like-minded groups and individuals. In this way religious traditions spread across regional areas and helped in the ongoing definition of Indian culture.

With the coming of British and other European colonizers came the impetus to create networks of railroads to facilitate the transfer of goods and labor across large areas that were not previously commercially connected. As the rail companies extended tracks into the countryside, many planned their lines along routes traditionally used for pilgrimages, seeing the pilgrims as an easy market for their products. Indeed, surveys were taken of pilgrims along major routes to determine how much they would be willing to pay for a rail service taking them to the site; most pilgrims acknowledged that they would be willing to pay nearly the same price as they

► THOMAS COOK AND HAJJ

Between 1886 and 1893 the English travel firm Thomas Cook and Son received a contract from the British government to ensure the health and safety along the railroads of Muslim pilgrims from India completing the hajj, or holy pilgrimage to Mecca. A Christian firm based in London, Thomas Cook and Son was thus employed by the colonial government in India with facilitating the fulfillment of requisite tenets of the faith for Indian Muslims. More Muslims were able to complete hajj more quickly than before, changing both the nature of pilgrimage and the relationship between commercial interests and a specific religious community in the colonial setting. While some viewed this situation as exploitative, we can now see that the railroad changed the relationship between the colonial government and its subjects, revolutionizing the interactions of government, private enterprise, and religious observance.

—Brock Cutler

spent on food and lodging during their pilgrimage. Thus, pilgrims themselves—and their traditional networks and routes—were not passive actors along these routes but instead actually determined to a large extent the shape and area of the railroad lines.

By the 1870s when many of the rail lines that originated at coastal hubs met up to create a legitimate railway network, pilgrims were using railroads for a large portion of their travels. For the most part, pilgrims did not separate along caste lines while on pilgrimage; however, the wealthier pilgrims were able to book passage in a car with seats, while the poorer groups made the trips in cars primarily designed to carry trade goods or animals. During the most popular festival times, extra goods cars were hitched to the end of the train, and as many people were let into a car as could stand inside it.

The relative economy and speed of rail travel allowed considerably more people to become pilgrims, affecting the nature of the pilgrims' journey in quality as well as quantity. The experience of pilgrimage changed from a lengthy but perhaps pleasant journey to a relatively quick but unpleasant ordeal in the train car. By increasing the

numbers of people who could become pilgrims, trains also changed the use of pilgrimage within religion: more people could now look at pilgrimage as a viable part of religious experience, and pilgrimage—even to distant sites—became more normalized within religious traditions.

Railways also complicated the categories of pilgrimage and tourism. The railroads were part of a larger process of technological modernization in India, along with which came the secularization of larger numbers of the population. These individuals did not necessarily give up the practice of pilgrimage but rather combined it with a more secular desire to visit sites in their country. Pilgrimage started to become a part of national tourism as more people changed their religious traditions into national traditions.

The Hajj in an Era of Steam Travel

The hajj, or pilgrimage to Mecca, in Saudi Arabia, is one of the five pillars of Islam. Healthy Muslim males must make the hajj at least once in their lives, as long as it causes no hardship for the family (Quran 2.196–198). The hajj takes place once a year during the second week of the last month of the year, Dhu l-Hijjah (usually April/May on the Western calendar). Women may also make the hajj, but only if they are married and with their husbands or accompanied by a (male) relative. Modern travel, which avoids many of the hardships of the past, has steadily increased the number of pilgrims. In 1876, for example, only 6,000 pilgrims made the hajj; in 2000, 2 million pilgrims journeyed to make the hajj.

Until the late nineteenth century, the journey to Mecca involved pilgrim caravans across

the desert, usually following trade routes, the majority coming through Damascus. Bedouin attacks were common; often, the government paid money (*surra*) to guarantee safe passage for pilgrims through certain tribes' areas. Prior to 1869 travel could take several months; the journey from Damascus to Medina took 30 days. When the Suez Canal opened in 1869, steamships shortened the journey. From 1908 to 1913 the Hijaz Railroad between Damascus and Medina made the trip even more rapid, but the railroad was used during World War I and partially destroyed.

Muslims from outside the immediate area often found problems when trying to secure permission to leave their home countries. European countries, including Russia, often made the necessary paperwork so complicated as to all but forbid Muslim departure. An outbreak of cholera in Europe in the 1830s was attributed to the return of Muslim pilgrims from Mecca. As a result, Europeans began to take an even more controlling interest in travel to Mecca by Muslims.

European and American Tourism in the Railway Age

Railway travel, especially during the railway age, inspires images of luxury and adventure. Yet when the first steam railways were constructed in England in 1825, little thought was given to carrying passengers. Entrepreneurs such as those behind the first railway lines, the Stockton and Darlington and the Liverpool and Manchester, believed that trains were best suited to carrying material goods. Companies soon reevaluated

their assumptions, resulting in 24.5 million people traveling by English trains in 1842, 73 million in 1850, and 507 million in 1875. By 1913 the London Brighton and South Coast Railway drew 75 percent of its revenue from passenger traffic.

At the same time, tourism itself attracted more and more devotees. From the late sixteenth century, many of Britain's most respected young men explored continental Europe to learn languages, improve aesthetic tastes, and master other skills necessary to become future diplomats, goals that were often abandoned by the young travelers who instead opted to pursue hedonistic excess in the bars and brothels of Italy and France. With time, this so-called Grand Tour drew more and more elite tourists and popularized the idea of travel among a still broader cohort. Although the age of the Grand Tour ended with the Napoleonic Wars, the invention and proliferation of railways made touring accessible to many more people than had been previously possible and launched a whole new age of bourgeois travel.

Not long after the construction of the first efficient railway engine, George Stephenson's Rocket in 1829, entrepreneurs dramatically expanded available rail lines in Britain and beyond. Between 1846 and 1848, 2,600 miles (4,200 kilometers) of track were laid in England.

➤ TRAVEL GUIDEBOOKS

The rise of leisure travel prompted a corresponding demand for guides that taught prospective tourists both what ought to be seen and also how to go about seeing important sites. Londoner John Murray was among the first to capitalize on the growing need when he published a *Hand-book for Holland, Belgium, and North Germany* in 1836. Karl Baedeker of Koblenz, Germany, followed suit with a similar guide three years later. Baedeker and Murray were the most successful nineteenth-century guidebook authors, but railway lines and package travel companies such as Thomas Cook and Son soon published their own guides to market their own products and to educate travelers about potential destinations.

—Eric Zuelow

The distance increased to 6,300 miles (10,100 kilometers) by 1851, 13,400 miles (21,600 kilometers) by 1870, and 18,700 miles (30,100 kilometers) by 1900. Similarly, the United States, with its vast landscapes ripe for exploitation, became smitten with railway construction. While a mere 23 miles (37 kilometers) of track existed in 1830, by 1860 entrepreneurs extended this to 30,626 miles (49,288 kilometers). American railways peaked in 1916 with an amazing 254,037 miles (408,833 kilometers) of track available to passengers. European countries such as Russia and Germany also undertook significant railway projects, although these efforts were quite conservative when compared with those undertaken in Britain and the United States.

The available tourist routes extended well beyond Europe and America. The rush to empire during the last years of the nineteenth century prompted a policy that is sometimes referred to as railpolitik. Rail lines allowed for the easier economic exploitation of territory by colonial powers, the rapid movement of military forces, and the conquest of new sights and sites by tourists. Thus, extensive railway construction in places such as India, South Asia, Latin America, and Africa allowed expanded travel options while also aiding imperial ambitions.

As the number of tracks increased, so too did the range of tourists. Initially, elites dominated railway travel. Railway companies believed that first-class travelers represented the highest potential profit, so tickets were accordingly expensive. At the same time, many elites worried that a mobile working class might bring political upheaval; keeping workers fixed to specific towns and cities was in everybody's best interest. Furthermore, workers and their social betters had vastly different ideas about how best to spend leisure time. While the middle and upper classes preferred quiet, solitary travel, workers expected a boisterous communal experience. Thus, elites turned up their noses at working class excursionists.

Despite objections, railway companies soon dismissed objections in favor of profits. In 1835 the Stockton and Darlington Railway added working-class, or third-class, compartments to its trains. In 1844 the Liverpool and Manchester Railway followed suit. Whereas first- and second-class compartments offered reasonably comfortable benches, third-class accommodations initially entailed little more than open boxes without seats; passengers, seen as little more than livestock, had to stand.

Although third-class passengers provided less than 20 percent of railway revenues in 1840, their numbers increased markedly after the 1851 Exposition in London, the first world's fair. This event, proposed by Queen Victoria's husband Prince Albert, celebrated Britain's industrial achievements. Employers encouraged workers to attend the event; many even offered them subsidized trips. Moreover, both working-class organizations and professional tour companies

such as Thomas Cook and Son endeavored to provide inexpensive fares. The result was a dramatic expansion of working-class interest in short-term excursion travel, especially to seaside resorts such as Blackpool in northwest England. By 1870 the proportion of third-class travelers increased to 65 percent of total travelers, providing some 44 percent of railway revenues. Third-class accommodations improved as a result, narrowing the gap between first- and third-class conditions.

Workers did not alone benefit from improved traveling conditions. Early first-class cars were dark and unpleasant. Sleeping cars, introduced on American trains in 1836, rode on inadequate springs, and passengers risked being bounced from uncomfortable bunks. Little changed until George M. Pullman, an inventor and industrialist, braved one of the cars in 1858 while traveling from Buffalo to Chicago. Horrified by his experience, he developed his first luxury sleeping car, the Pioneer, in 1864. The car, both larger and wider than ordinary rail cars, sat atop more comfortable springs and provided travelers with comparatively luxurious accommodations. After his first Pioneer was used as part of Abraham Lincoln's funeral train, Pullman launched the Pullman Car Company. Throughout the rest of the century, the company offered a line of luxury sleeping, dining, and passenger carriages. For well-to-do tourists, the prospect of long-distance adventures, such as across the United States, became considerably more appealing.

With expanded routes and a range of available carriages, companies such as Thomas Cook and Son offered more package tours. At first, Cook focused his efforts on trips to Scotland—Cook's Tartan Tours—as well as working-class excursions to seaside resorts and to the countryside. After his son John Mason joined the business in the 1860s, the company offered more and more high-priced packages to continental destinations. They added an American trip in 1866. Trips to Egypt and the Middle East followed not long after.

Meanwhile, American railway companies used the growing tourism market as a money-maker. Following completion of the First

Transcontinental Railroad in 1869, the Northern Pacific and Santa Fe Railway Companies, among others, moved to diversify their products. Railroad companies developed the first national parks, complete with theme hotels and star attractions, to expand rail revenues. Visitors anxious to travel to Yellowstone, Glacier, and the Grand Canyon National Parks arrived at their destinations in luxurious Pullman cars.

The great age of railway tourism ultimately drew to a close with the appearance of affordable automobiles and, eventually, cheap airfares. Yet the imagined romance of rail travel has yet to disappear.

Seaside Resorts

Seaside resorts became the preferred leisure destination for the traveling middle and upper classes—and eventually for many in the working classes as well—over the course of the nineteenth century. Their growing appeal as tourist destinations signaled a great shift both in cultural and medical attitudes toward the sea and also in the social composition and mores of the touring class. Seaside resorts played an essential role in the development of leisure as a defining component of modern life.

Even the most seasoned European traveler of the early 1700s would have been astonished, and not a little mortified, by the prospect

➤ TAKING THE WATERS

The word “spa,” borrowed from the name of a Belgian resort town to describe any facilities for supervised water therapy, has now become a generic term for therapeutic relaxation facilities. Early spas were developed at locations with natural thermal or mineral springs, whose use was sometimes already part of much older healing traditions. The development of what is termed “hydrotherapy” is usually traced to the Romans, who throughout their empire constructed public baths for recreational and therapeutic use. New theories developed with a revival of interest in the sixteenth century with the publication in 1553 of Conrad Gessner’s *De balneis omnia quae extant* a book summarizing knowledge of the medical properties of water. During this European revival, wealthy men and women organized seasonal retreats to the spas to experience a social and therapeutic regime under medical supervision. Well-known European spas included Aix-les-Bains and Vichy in France, Carlsbad and Baden-Baden

in Germany, Aquincum and Hunyadi Janos in Hungary, Karlovy Vary in the Czech Republic, and Tunbridge Wells in England. After the French revolution, spa culture was further elaborated; by the eighteenth century, it had spread to the middle classes in Europe and America.

North American spa culture is linked directly with older traditions via developments in nineteenth-century hydrotherapy, a treatment with a particularly strong female following. In North America, natural-resource-based resorts combined Old-World-style facilities with regionally influenced architecture and treatments. Their models were predominantly western European; well-known spas like Saratoga Springs in New York, Hot Springs in Arkansas, and Banff in Alberta drew wealthy families for extended seasonal visits by offering them a wide range of organized activities and recreational facilities, as well as treatments at their hot springs.

—Teri Brewer

The Promenade and Tower from South Pier, Blackpool, England, about 1900. (Library of Congress)

of repairing to coastal areas to find repose and rejuvenation. The sea was viewed as a place of danger and oblivion, fueling fear and incomprehension far more than desire. British upper-class travelers first began in the mid- to late

eighteenth century to look to the sea as a site for healthful invigoration and sublime imaginative release. Following their lead, continental royals, aristocrats, and upper bourgeois began in the early nineteenth century to migrate to beach areas for pleasurable repose from court life and urban discomfort. The dramatic expansion of railway networks from the 1830s forward in Europe and the United States was key in bringing coastlines within easy reach of large cities, and the growing speed, comfort, and affordability of the trains made pleasure travel a real possibility for the middle classes. As tourist traffic grew, seaside resorts capable of receiving larger crowds for extended periods multiplied on both the American and European shores of the Atlantic, along the Mediterranean coast, and on the Adriatic and Baltic coasts as well.

The names of these elite resort towns would become fixed in the vocabulary of the international traveling classes: Scarborough, Brighton, and Weymouth in England; Dieppe, Trouville, St. Tropez, and Nice in France; and Newport and Southampton in the United States. At these resorts, sea bathing was only one part of the

experience and not always the most important one. These were places of bourgeois and aristocratic sociability, so a full retinue of leisure and social activities structured the day, with the plunge into the water usually taking place—if at all—in the morning. Beach resorts of this elite type centered around one or more grand hotels, luxury palaces embodying the latest in comfort and taste. The hotels commonly housed casinos as well, offering a seemingly limitless array of distractions that included daily dinners and teas, seaside promenades, excursions to nearby towns in search of local color, dances, and sport. The round-the-clock pursuit of amusement had to coexist with still-prevalent norms of modesty and respectability, however. Bathing costumes commonly covered most of the body with heavy material, and many beaches enforced gender segregation.

A leisure site of the well-to-do for most of the nineteenth century, the seaside gradually

began to attract a more socially diverse clientele. Again, Britain was at the forefront of this popularization of leisure, with the resort town of Blackpool receiving working-class day trippers in the 1870s. By the late nineteenth century, coastal areas of the northeastern United States such as Cape May on the Jersey Shore were attracting a heavy traffic of workers from nearby cities during the summer months. Coney Island in Brooklyn, New York, incorporated its coastline into a vast complex of spectacular amusements, auguring the dawning of a new age of mass consumption in the twentieth century.

Politics and Statecraft

Political change between 1750 and 1914 was far-reaching and ubiquitous. Economic and social changes generated new conflicts, posed new challenges for leaders, and produced new ways of thinking about government and the state. Huge empires disappeared, and new ones came into existence. Revolts and revolutions convulsed many societies, while in others “reform” became a watchword. New ideologies, including democracy, liberalism, nationalism, and socialism, clashed with centuries-old political principles of monarchy and hierarchy. Most importantly, states became more efficient and expanded the scope of their activities even while written constitutions in some parts of the world bound rulers and subjects alike to a set of mutually accepted rules.

The increase in state power was a worldwide phenomenon but was most pronounced in Eurasia. In the 1700s the larger Eurasian states were governed by monarchies that focused their energies on two related tasks: first, the maintenance of a strong military, and second, the collection of sufficient revenue to pay for it. The need for revenue in turn required attention to the regulation of trade and other economic matters. But many socially useful and even necessary undertakings—policing, providing justice through the court system, education, the care of the poor and sick, and the maintenance of food supplies—were left to private individuals, local elites, or private charities. Furthermore, since bureaucracies were expensive, many tasks of government were carried out by unpaid local magnates or municipalities rather than actual government officials. Many states depended on large landowners to recruit troops and collect taxes, while others assigned the task of collecting taxes to private financiers or tax farmers, who collected taxes and kept a percentage for themselves.

Beginning in the late 1700s the scope of state activities began to expand, and the rights, privileges, and responsibilities of local communities, powerful social classes, and organized religions were limited or abolished altogether. The first examples of this trend can be found in late-eighteenth-century Europe, where “enlightened despots” such as Frederick II of Prussia (r. 1740–1786) and Joseph II of Austria (Holy Roman Emperor, 1765–1790; archduke of Austria, 1780–1790) sought to increase revenues and efficiency by attacking customary law and the privileges of nobles, towns, provinces, guilds, and representative assemblies. But the major example of

Beginning in the late 1700s the scope of state activities began to expand, and the rights, privileges, and responsibilities of local communities, powerful social classes, and organized religions were limited or abolished altogether.

the new intrusive, all-powerful state emerged in France during the era of the French Revolution and Napoleon, when state power was marshaled to reform and restructure French society from top to bottom while simultaneously recruiting and outfitting what to that point was the largest army in European history.

Following Napoleon's defeat the scope of state activities in Europe continued to grow, especially from the 1870s onward, when tax revenues generated from population growth and industrialization supported expanding budgets. European states invested in education; assumed greater responsibility for public health; carried out censuses; compiled data on agriculture, trade, and manufacturing; issued visas and passports to control travel and migration; and introduced or expanded postal services. The German and Russian governments took active roles in promoting industrialization. Following Germany's lead, states began to provide social security for their citizens by making available health insurance and old-age pensions. Larger states extended their systems of military conscription, and armies and military budgets grew, as did the apparatus of government. Between 1850 and 1914 the number of government employees increased from 140,000 to 864,000 in Austria-Hungary, from 67,000 to 535,000 in Great Britain, and from 300,000 to 583,000 in France. Germany, which did not exist in 1850, had 1 million government employees in 1914.

State growth also occurred where Europeans settled or established colonies. During the 1800s Australia and much of North America came under state control for the first time. In sub-Saharan Africa many hundreds of local and regional political entities were replaced by a few dozen colonial states, all with clearly delineated borders imposed by European diplomats. Within these colonial states, Europeans introduced new efficiencies to the tasks of organizing armies and collecting taxes but, like many previous African rulers, still relied on village headmen and "chiefs" to do the government's work at the local level. In India the colonial government planned railroads, undertook mammoth irrigation projects, initiated telegraph and postal systems, and oversaw schools.

In Meiji Japan, every step in its transition to a modern industrial state was directed by a central government that on taking power abolished Japan's ancient political structures and entire social classes, introduced military conscription and new tax schemes, and began issuing directives on everything from education to personal grooming habits. In the Ottoman empire, Persia, Thailand, and Ethiopia, reform inevitably entailed an increase in state authority, as central governments took steps to modernize armies, educational systems, and economies. Even in the United States, with a traditional distrust of central power, the federal government in the early 1900s undertook new initiatives in the areas of economic regulation, consumer legislation, and conservation.

As states became more powerful, subjects in some parts of the world were determined to find ways to control or at least influence how that power was exercised. The revolutions in the Atlantic world at the end of the eighteenth and in the early nineteenth centuries—American, French, Haitian, and Latin American—all were directed at ending "tyranny," the abuse of state power by absolute monarchs and their

officials. To prevent tyranny, revolutionaries created a new instrument: written constitutions. These documents set forth specific rules on how the state should function and provided protections for the individual's right to criticize the government. They also provided for elected representative assemblies with control of legislation and taxes and at least some influence on foreign policy and ministerial appointments. If constitutional safeguards and parliaments were not enough, subjects, as the only legitimate source of political authority, had recourse to revolution. As stated in the U.S. Declaration of Independence, when a government is destructive of basic human rights, "it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness."

The short-term results of the Atlantic revolutions were disappointing. Independent Haiti sunk into political turmoil, and many politicians of the new Latin American states ruled as they pleased despite what their constitutions said. Following the Congress of Vienna, monarchies were restored in much of Europe. But in Europe the conservative revival was a brief prelude to a period of renewed political ferment, marked by the emergence of new ideologies, frequent revolutions, and the erratic but unmistakable progress of constitutionalism and parliamentary government.

The most notable feature of nineteenth-century European (and American) politics was the degree to which people from all walks of life became politically involved. For some this meant backing revolutions, dozens of which occurred across Europe between 1820 and 1905. For others it involved taking part in demonstrations, joining political clubs, following political developments in newspapers and journals, rioting, or signing petitions. In 1842 no fewer than 3.3 million individuals signed a petition submitted to the British House of Commons demanding annual parliamentary elections and the extension of suffrage to all adult males. By 1842 universal manhood suffrage (barring slaves) already had been established in the United States and would gradually take hold in much of Europe. By the onset of World War I it existed in France, Germany, Britain, Austria-Hungary, Switzerland, Belgium, the Netherlands, Norway, Spain, Greece, Bulgaria, and Serbia. Women were excluded from voting in national elections, but in the United States and England they were pushing hard to change this. Extending the franchise led to the growth of political parties that represented the full spectrum of ideologies from monarchism to socialism. In 1910 the party with the largest representation in the German Reichstag was the Social Democratic Party, which espoused socialism and represented the interests of Germany's industrial working class. Much had changed since 1750, when a German state, elected parliaments, an industrial working class, and socialism (both the word and the concept behind it) had not existed.

The most notable feature of nineteenth-century European (and American) politics was the degree to which people from all walks of life became politically involved. For some this meant backing revolutions, dozens of which occurred across Europe between 1820 and 1905.

In much of Asia and Africa, indigenous political development came to a halt once colonialism was imposed, and in those states that remained independent, Western political ideologies and practices were only one of several influences on government institutions and political movements. Some of the most important developments in the 1800s—jihad in Africa and the Taiping Rebellion in China—drew on religion, not the principles of the French Revolution. Many reform-minded leaders at first were convinced that economic and military reforms were possible while maintaining traditional political structures and practices. This changed, however, as the century progressed. In 1876, hoping to show the world its dedication to modernization and prevent the abuse of power by the sultan and his officials, reformers in the Ottoman empire convinced Sultan Abdulhamid II (r. 1876–1909) to support a constitution, only to have him suspend it a year later. The leaders of Meiji Japan, after studying and observing the workings of government in the United States and Europe, also concluded that their project of economic and military modernization would be well served by adopting a written constitution. Announced to the Japanese by the emperor in 1890, the Meiji Constitution outlined the rights and duties of the emperor and his subjects, spelled out the functions of government, and established a bicameral parliament chosen by an electorate of some 450,000 voters. Such practices, it was believed, would provide clear lines of communication between rulers and subjects and engage political activists and local elites in the governing process. The Ottoman and Japanese constitutions were drawn up by officials and were simply presented to the populace, but in the early twentieth century in Persia, China, and the Ottoman empire, where the 1876 constitution was defunct, constitutional government was instituted the same way it had been introduced in Europe and the Americas: through revolution. A phenomenon that in the late eighteenth century had initiated more than a century of far-reaching political change in Europe and the Americas had now reached Asia, where the effects would be just as momentous.

Many of the leaders of these revolutions were ardent nationalists who rose up against their sultan, shah, or emperor not necessarily because they loved constitutions and parliaments but because they could

not bear living under rulers who had failed to protect their nations from defeat and humiliation at the hands of foreigners. Nationalism emerged during the era of the French Revolution, when the French people fought with new patriotic fervor to save their revolution and extend France's borders, and Germans, Russians, Italians, and others fought with equal fervor to break Napoleon's hold on Europe.

Nationalism became a potent force, lead-

Nationalism became a potent force, leading to revolutions across Europe in 1848, the unification of Germany and Italy between 1860 and 1871, and anti-Ottoman wars of liberation in the Balkans from the 1820s onward.

ing to revolutions across Europe in 1848, the unification of Germany and Italy between 1860 and 1871, and anti-Ottoman wars of liberation in the Balkans from the 1820s onward. By the end of the century nationalism had become a secular religion, taught in schools and patriotic

histories, instilled through military training, and replete with rituals, monuments, anthems, marches, martyrs, and heroes. This gave people a feeling of being part of something grand and noble and inspired support for their leaders' programs of militarization and imperialism.

Outside of Europe nationalism also was becoming a potent force, especially in Algeria, Egypt, India, Vietnam, and the Philippines, where leaders drew on its power in their struggle against colonialism. In China it was directed against both foreign rule of the Manchus and Western interference. In India a sense of nationalism grew out of colonialism, which helped people of the subcontinent think of themselves as "Indians"—a common identity bolstered by the colonizers' efforts to build roads, railroads, a postal system and impose English as the lingua franca among the elite. This new sense of nationhood inspired the founding of the National Congress in 1885, popular support for boycotts of British goods in the early 1900s, and the decades-long struggle for independence under the leadership of Mohandas Gandhi from the 1920s to 1947.

The winning of independence by India and Pakistan along with many dozens of former colonies is one example of how nationalism affected developments in the twentieth century. Nationalism also contributed to the causes and dreadful slaughter of World War I; inspired fantastic dreams of military glory among Italian fascists, German Nazis, and Japanese imperialists; and was a direct cause of World War II, the most dreadful war in human history. No other ideology has matched its awesome power to inspire and destroy.

■ Introduction: Government and Politics, 1750–1800

The world between 1750 and 1800 was on the brink of momentous political changes, and in some parts of the world these changes had already begun. Safavid Persia and Mughal India, two of the three great Islamic empires that had dominated southern and southwestern Asia in the early modern era, disintegrated. The Thirteen Colonies declared their independence from Great Britain in 1776, and in the wake of what came to be known as the American Revolution, a new republic based on democratic principles, the United States of America, came into existence. In the 1790s France also experienced a revolution that brought down the monarchy, ended aristocratic privilege, reduced the power of the Catholic Church, and introduced nationalism as a potent political force. In China, Japan, Latin America, the Ottoman empire, and much of Africa, older

political forms prevailed, but tensions and problems were growing.

Rulers and regimes around the world faced many different challenges in the eighteenth century, but one they shared in common was how to match revenues with expenses. This was an old problem but one that had become especially acute in Europe and southern and southwestern Asia as the size of armies grew and needed to be equipped with cannon, artillery, and firearms. Revenues, which were limited by exemptions and bureaucratic inadequacies, might have sufficed in peacetime but not in times of war. At the end of the seventeenth century, the need to increase revenues compelled the Mughal emperor Aurangzeb to launch a series of military campaigns to extend his territory in southern India, but they only compounded the empire's fiscal and political problems and led to its rapid decline in the

1700s. In Europe, the need of governments to pay for debts incurred in two major midcentury wars, the War of the Austrian Succession (1740–1748) and the Seven Years' War (1756–1763), drove government policies from the 1770s onward and had ramifications for the Americas and even China. In Europe, this was the age of enlightened despotism in which rulers in France, Austria, Prussia, Russia, and a host of smaller states sought to augment revenues by expanding commerce, increasing agricultural production, and, most importantly, boosting revenue by devising new taxes, taxing previously exempt regions and persons, limiting regional autonomy, and increasing the size and efficiency of their bureaucracies. Spain and Great Britain imposed new taxes not only on their European subjects but also on those in the Americas. In the 1760s “No taxation without representation” became a rallying cry in the Thirteen Colonies and discontent over new taxes caused Inca revolts in the 1740s and early 1780s and set the stage for the Latin American wars of independence after 1800.

Other parts of the world were not immune from political tensions and discontent. During the closing years of Qianlong's reign (1736–1795, informally until 1799) against a backdrop of growing population pressure and ongoing European efforts to open China to increased trade, China experienced an embarrassing military setback in Vietnam, the outbreak of rebellions in several parts of the empire, and a growing uneasiness over the state's failure to address pressing fiscal and administrative issues. In Japan the eighteenth century was a period of ongoing fiscal crisis, brought on mainly by decades of economic stagnation going back to the early 1700s. Shoguns and daimyo alike cut costs, borrowed, manipulated the currency, and made new demands on their subjects in the form of taxes and labor requisitions. Tensions between domain rulers and the shogun's administration grew, as did the level of discontent in villages and cities.

In Africa a variety of factors—the intensification of the slave trade, Islamist revival in the western Sudan, population pressures in the south, and growing commerce in eastern and southern Africa—all contributed to political instability and change. In Africa and elsewhere, however, the political changes of the 1700s were

mere previews for the momentous upheavals that were to follow in the nineteenth century.

—*James H. Overfield*

The Ottoman Empire—Government Practices and Institutions, 1750–1800

The institutions and practices of the Ottoman government became increasingly decentralized between 1750 and 1800. Ostensibly, the sultan and the bureaucratic, military, and religious elites, especially the janissaries and the ulema (scholars of Islamic law), were to use their positions to integrate, appease, and rule the diverse religious, ethnic, and social groups within the Ottoman empire. Although the Ottoman government enacted legislation concerning foreign policy and broad judicial and fiscal issues, in practice it otherwise allowed the various provinces to carry out the everyday tasks of government. After coming to power in 1789, Sultan Selim III attempted to strengthen his own position through the implementation of numerous military and economic reforms. However, the initiatives of Selim III actually increased the power of local elites at the expense of the sultan.

The Ottoman system of government in the late eighteenth century included religious and secular institutions that existed to ensure the stability of the Ottoman state. The janissaries were the elite military corps, garrisoned throughout the empire to defend it from external attacks and to maintain internal law and order. The scribes constituted the Ottoman imperial bureaucracy, which oversaw the administration of everyday affairs in the capital, Istanbul, and the passing of decrees relevant to the provinces. The ulema were highly respected religious scholars whose role was to safeguard the conservative moral order that characterized the long-standing traditions of the Ottoman state.

Although these institutions helped preserve the relative stability of the Ottoman state in the late eighteenth century, their underlying weaknesses led to the shifting of administrative power from the Sublime Porte (the imperial bureaucracy) to the local provinces. For instance, in the course of the eighteenth century the military capabilities of the janissaries fell behind

those of the European armies, which had undergone a military revolution from 1650 to 1750 through the development of more advanced firearms and battlefield tactics. Nevertheless, the presence of large numbers of janissary troops in the provinces gave them an elite status. Moreover, their prevalence precluded the imperial Ottoman government, which was small in size and lacked modern tools of communication and transport, from enforcing its own power in outlying districts of the empire. Likewise, the ulema also served in the various provinces and concerned themselves increasingly with local affairs, frequently promoting religious and educational public work programs. Both the janissaries and the ulema allied themselves with powerful guilds that controlled the local economies in order to enhance their own elite status.

➤ **AYAN AND THE OTTOMAN STATE**

The *ayan* (provincial notables) played a crucial role in the practices of the Ottoman government during the late eighteenth century. The *ayan* consisted of important individuals or elite families who had enormous wealth and typically filled positions in the provincial government as military officers, tax collectors, or governors. The *ayan* established powerful support bases in the provinces, which forced the Ottoman imperial government to recognize them as intermediaries between the Sublime Porte and the local population. One such notable, Ali Pasha of Yanina, even ruled northern Greece and Albania for several years and was widely viewed as a vassal prince rather than an Ottoman subject.

—Jake Hamric

Reception at the court of Sultan Selim III at the Topkapi Palace, Istanbul, Ottoman period, late eighteenth century. (Bridgeman-Giraudon/Art Resource, NY)

In 1789 Sultan Selim III enacted a comprehensive economic and military reform program called the *Nizam-I Cedid* (New Order). These reforms were designed to increase central state power by solidifying the collection of taxes in the provinces and instituting a greater amount of organization and discipline in the janissary corps. In general, Selim III wanted to restore the principle of *adalet* (justice) to Ottoman government. However, his reform measures failed due in large measure to the fierce opposition of the janissaries and conservative religious leaders. Moreover, the sultan relied on the *ayan* (provincial notables) for tax collection as well as for providing a suitable army to fight the French after Napoleon's invasion of Egypt in 1798 and to fight the Russians after war was declared in 1806. Nevertheless, the New Order allowed for Ottoman officials to consult with European advisers about the Ottoman economy and military and therefore served as a period of transition between the centralized Ottoman state of the seventeenth century and the *Tanzimat* (Reforms) of the nineteenth century.

Chinese Government during the Reign of Qianlong, 1736–1795

The Qing dynasty emperor Hongli, better known by his reign title, Qianlong, was the longest-ruling monarch in Chinese history. Coming to the throne in 1736, he formally reigned until 1795, when he officially abdicated in order to avoid the appearance of eclipsing his grandfather but held on to power until his death in 1799. During his reign the economic growth and population increases that had begun under his grandfather, the Kangxi Emperor (r. 1662–1722), and his father, the Yongzheng Emperor (r. 1723–1735), continued. China's fortunes deteriorated soon after Qianlong's death, however, paving the way for the social upheavals and military setbacks of the nineteenth century.

Qianlong's reign was the high point of the Qing dynasty and the beginning of its deterioration. During his reign the size of China doubled, and he laid the groundwork for a multiethnic empire. He was also one of the great patrons of the arts. During his reign, Beijing went through a massive beautification program. The formerly austere capital was supplied with numerous palaces, walls, gardens, and gate towers. Painting and literature flourished. He also had many shortcomings as a ruler. Factional strife between Han and Manchu subjects increased during his reign. Toward the end of his reign, increasing corruption brought about a growing cynicism toward the government. And, most importantly, he failed to appreciate the growing importance of Western powers such as Britain.

When Qianlong came to the throne as a young man, he was aware of the dangers of factionalism and set about to ensure that no group was dominant at court. Nevertheless, there developed a rivalry over influence at court between the powerful ministers who had been instructed by his father, the Yongzheng Emperor,

During the long reign of the Qianlong emperor, China remained the wealthiest and most populous nation in the world. Signs of future problems, however, became evident in the last years of his reign. (Réunion des Musées Nationaux/Art Resource, NY)

to watch over him: E'ertai (1680–1745), a Manchu whose followers were mostly Manchu, and Zhang Tingyu (1672–1755), whose followers were mostly Chinese. Qianlong gradually weakened both sides by slowly withdrawing his support from them. In later years, Qianlong allowed no faction to become powerful at court. Nevertheless, by the end of his reign, court favorites dominated the political scene.

Qianlong's manner of governing was a compromise between the sternness of his grandfather and the relative flexibility of his father. In particular, Qianlong was generally forgiving when it came to corruption on the part of his officials. Yet he could be harsh when he felt that the officials had not been fully loyal or had failed in some particular endeavor. For example, when the general Nuoqin had lost battles in Sichuan in 1749, Qianlong had him beheaded with Nuoqin's grandfather's sword in front of the defeated army.

➤ HESHEN AND CORRUPTION AT COURT

In 1775 Heshen (1750–1799) was an obscure Manchu Banner soldier stationed at the Qianqing Gate when he met the Qianlong emperor. Qianlong, who was 65 years old at the time, took an immediate liking to Heshen, and the two became fast friends. Over the next few years Heshen rose meteorically through the ranks, being granted a number of exceedingly high appointments including superintendent of the Customs at the Chongwen Gate (which allowed him to earn a fortune), president of the Board of Revenue, and lieutenant general of a Manchu banner. Qianlong even betrothed his beloved daughter to Heshen's son in 1780; the two were married in 1790. Heshen's power was formidable and his greed limitless. For the next 20 years he filled the government with his friends and family and made himself an immense fortune from all sorts of corrupt practices. However, when Qianlong died the Jiaqing emperor stripped Heshen of all his positions and power. Heshen was allowed to commit suicide, but his son (who was Jiaqing's brother-in-law) was allowed to live and later attained high titles.

—Ihor Pidhainy

Qianlong was more successful in unifying the Qing empire. He did this by ruling as the ideal ruler in the eyes of all his people, speaking their languages and writing in their scripts. For the Manchus, he was a traditional Manchu warrior who upheld Manchu customs and rituals. For the Han Chinese, he was a Confucian emperor steeped in Chinese culture. He paid close attention to the ideas of loyalty and filial piety and visited Confucius's temple nine times, where he kowtowed in obedience at the philosopher's tomb. For the Mongols and Tibetans, Qianlong was a Buddhist monarch, a reincarnation of Manjusri, the Bodhisattva of compassion and wisdom.

In addition to representing himself as the bearer of culture, Qianlong also instigated a great scholarly project: the Four Treasuries Library, one of the great Chinese cultural achievements. Between 1772 and 1787, thousands of scholars were employed in gathering, selecting, editing, and commenting upon thousands of works. The final work consists of over 3,500

complete texts, with summaries of more than 10,000 additional texts. This project, however, went hand in hand with Qianlong's literary inquisition, by which thousands of books were burned for political and moral reasons. The vast majority were destroyed because of derogatory writing about the Manchu, their rulers, or earlier non-Han dynasties. The writers and their families were often executed or sent off as slaves to the far reaches of the empire.

Qianlong's military undertakings were generally successful, although there were several unsuccessful campaigns. The empire was expanded through its many wars. This included the defeat of the Dzungars, whereby Qianlong was able to secure the area of Xinjiang and to maintain control over the Dalai Lama and the Mongols. Qianlong's armies also defeated the Gurkhas of Nepal, the Jinchuan (Khamba Tibetans), the Uighurs, and rebels in Taiwan. However, his armies did not succeed in every major encounter. They fared poorly in both Burma and Vietnam. These wars were a major drain on the treasury, even though much of their costs were subsidized by merchants.

Finally, Qianlong's reign saw the growth of contact with Western powers, particularly England, whose importance in trade was growing throughout the century. All European trade was limited to the port of Guangzhou, where Western merchants were restricted to dealing with Hong merchants. Due to these restrictions and the trade deficit with China, Great Britain sent an ambassador to the Qing court in 1793. The mission, led by the experienced diplomat Lord Macartney, accomplished many of its objectives but failed to establish formal diplomatic or trade relations. The mission is remembered today for the refusal of Lord Macartney to perform the ritual kowtow to Qianlong and the Qianlong emperor's rejection of British requests to expand trade. It is noteworthy, however, that Qianlong invited Macartney to return the following year. Unfortunately, the Napoleonic Wars intervened, and by the time another mission was sent, both Macartney and Qianlong had died. Friction between the Chinese and the British continued, leading to the Opium War in 1839.

Qianlong's reign was the turning point in the fortunes of the Qing dynasty. The extensive

warfare drained the government treasury. Corruption, particularly after 1775 when a favorite, Heshen (1750–1799), was appointed to high positions of power, was also a major problem. After Qianlong's death, the empire began its downward spiral so that within two generations it was embroiled in a major rebellion (Taiping) and had lost wars to Western armies.

Japanese Government and Politics in the Eighteenth Century

Japan was ruled by the Tokugawa shogunate from 1600 to 1867. The Tokugawa political system is usually referred to as the *bakuban* system, linking the *bakufu*, the government of the shogun, and the *han*, the domains of the local daimyo (lords). The government was feudal in its structure and organization in that the shogun and his central government bureaucracy in Edo (now Tokyo) exercised control over each daimyo as a feudal suzerain. The shogun treated the daimyo as his personal vassals bound to him with oaths of personal loyalty in return for which the daimyo held their domains as fiefs of the shogun. Actual government rule came from a group of senior councillors who worked with or on behalf of the reigning shogun. Each daimyo governed one of Japan's approximately 280 domains through a group of officials, samurai, who achieved this leadership rank through family inheritance.

The shogunate designed numerous regulations to prevent the daimyo from expanding

their power at the central government's expense. Daimyo were expected to maintain surveillance on each other's domains and to report suspicious activity to the shogun. There were severe limits on what a daimyo could do, where he could travel, and how many samurai retainers he could keep. All daimyo were required to travel to Edo at least once a year or every other year depending on the distance of their domain from Edo (*sankin kotai*). They had to maintain a sumptuous house in Edo and to leave their families there as virtual hostages. They always traveled with a number of domain officials, retainers, and guards at all times. Failure to comply with these regulations could mean transfer of the daimyo to a smaller domain or even complete confiscation of the daimyo's lands.

The daimyo were divided into three categories: *fudai* (vassal), *shimpan* (collateral), and *tozama* (allied). These divisions derived not from strength or wealth but rather from the degree of trust that the shogunate had in them. The *fudai* daimyo descended from families that had served under the Tokugawa before 1600. Their territories frequently abutted shogunal lands, thus forming a buffer from outside attack, and most of the shogun's high officials came from their ranks.

The *tozama* daimyo, by contrast, were literally kept at a distance. Most *tozama* daimyo descended from houses that shogunal founder Tokugawa Ieyasu considered too strong to be his direct vassals or had allied with him only after he had seized power in the Battle of Sekigahara in 1600. Their domains tended to be larger than those of the *fudai* and were located in regions far from the center of Japan. *Tozama* daimyo were not allowed to participate in the administration of the shogunate. The *shimpan* daimyo were branch families of the Tokugawa, were given domains confiscated from other daimyo, and were excluded from office in the bakufu. The result was a highly structured and orderly political system that allowed central political authority to reach far down into the general population.

The politics of the shogunate, like those of the domains, has been described by historian Peter Duus as court politics in which power was consolidated through personal influence, alliances, and persuasion. The shogun's top officials (*roju*) built up factions of supporters through

friendship, patronage, and marriage and secured power through coalitions with other factions and with other *fudai* daimyo. An extensive bureaucracy under the *roju* collected taxes, managed finances, legislated and enforced laws, managed economic enterprises, and built and maintained infrastructure.

The major political questions tended to be socioeconomic. Foreign affairs mattered little because Japan had closed itself from any contact with the outside world since the first years of the Tokugawa era. Peace contributed to a commercial revolution that in turn brought about several transformations: urbanization, population growth from about 18 million in 1590 to about 25 million in the early 1800s, the growth of wealthy and powerful merchant houses, and the emergence of a class of wealthy farmers and landlords. Unfortunately for the shogunate and many daimyo, taxes and fees were at fixed levels, which caused many of them to fall into debt when income failed to keep up with expenses.

Some domains fared better than the shogunate because they often were able to gain monopolies on items produced, sold, and traded from their regions. The shogunate tried to make ends meet by extracting forced loans from wealthy merchants or debasing currency to pay off loans with cheaper money. Various attempts at government reform in the eighteenth century called for curtailing merchant privileges, greater austerity in shogunal spending, price fixing, and debasement of currency. At the same time there was considerable discontent among samurai throughout the country because their fixed incomes could not keep up with inflation.

The traditional political order imposed by the shogunate in the early 1600s was experiencing considerable stress by the end of the eighteenth century. The daimyo and samurai faced increasing financial problems as their fixed revenues or stipends failed to keep up with rising prices. Some merchants and large-scale landowners prospered, but many ordinary peasants experienced hardships and vented their frustrations through riots and protests.

The arrival of foreign ships in the early 1800s provoked a major crisis for the bakufu. At first the shogunate was able to keep the foreigners at bay, but a strong show of force by an American

squadron led by Commodore Matthew Perry in 1853 and 1854 forced the government to open Japan and to rescind its exclusion policies. This evident weakness encouraged certain *tozama* domains and samurai to rise up against and eventually overthrow the shogunate in the late 1860s.

Enlightened Despotism in Prussia, the Habsburg Empire, Sweden, and Spain

The form of statecraft known as enlightened despotism, which emerged in Europe during the late eighteenth century, attempted to combine philosophical ideals of social justice with the institution of hereditary, absolute monarchy. French Enlightenment thinkers such as François-Marie Arouet (Voltaire) and Denis Diderot encouraged Europe's rulers to use their power to implement reforms, such as religious toleration, increased access to education, equality before the law, and

the abolition of serfdom. Monarchs in Prussia, the Habsburg Empire, Spain, and Sweden all adopted policies that reflected Enlightenment thought to varying degrees. These policies, however, were motivated more by pragmatism than idealism. Their purpose was to strengthen monarchical government and increase productivity.

The intense competition between Prussia and the Habsburg Empire during the eighteenth century was the impetus for reform in both regions. The two monarchies were enemies in the War of the Austrian Succession (1740–1748) and the Seven Years' War (1756–1763). Frederick II (Frederick the Great) of Prussia (r. 1740–1786) sought to strengthen his state by allowing non-noble Prussians to become army officers, government officials, and judges, positions that had previously been the exclusive preserve of the nobility. This measure increased the pool of talent that Frederick drew upon to administer his kingdom. He also abolished serfdom on Crown lands, which both reduced peasant unrest and increased the number of subjects who were compelled to pay monetary taxes. While both measures were in keeping with the Enlightenment ideals that Frederick admired, they also increased his power as a monarch.

The Habsburg Maria Theresa (r. 1740–1780) distrusted the ideas of the French Enlightenment and banned the works of Voltaire from the Habsburg Empire. Nevertheless, the empress recognized that such egalitarian measures as increased taxation of the nobility and clergy as well as limits on the degree of labor imposed on the peasantry would result in increased stability and greater revenue for the Crown. Maria Theresa's son, coruler, and eventual successor, Joseph II (r. 1765–1790), admired the progressive theories espoused by Voltaire and the other philosophes, but on becoming emperor the implementation of a single educational system from the elementary grades to university served a practical purpose. The new system provided educated bureaucrats for the Habsburg civil service. Joseph's more radical innovations, such as a universal property tax, the dissolution of the monastic orders, and equalization of judicial penalties for all social classes provoked widespread opposition, and as a result many of these measures were reversed after his death.

Frederick II, also known as Frederick the Great, was one of the most important rulers in German history. He ruled Prussia as an enlightened despot between 1740 and 1786, firmly establishing his kingdom as one of the great powers of Europe. (Library of Congress)

► THE ROLE OF FRANCE IN THE 1772 MILITARY COUP OF GUSTAVUS III

When Gustavus III ascended the Swedish throne in 1771, the Estates of the Realm (members of the nobility, clergy, burghers and peasants, all of whom had deputies to represent their views in parliaments), were divided into two distinct factions: the “Hats,” who supported a closer relationship with France, and the “Caps,” who supported a closer relationship with Russia. The differences between the two factions prevented the young king from implementing his proposed reforms. Gustavus III predicted the necessity of a coup before his ascension and traveled to France in 1771 to gain support for increased monarchical authority in Sweden. In Paris, Gustavus was praised by prominent philosophes such as Voltaire because of his espousal of Enlightenment ideals. On the

advice of former French foreign minister Etienne-François duc de Choiseul, France agreed to pay 1.5 million livres in annual unconditional subsidies to the Swedish monarchy and appoint an ambassador to Stockholm. This backing from the French government allowed Gustavus to wield the necessary financial and diplomatic resources to support his military coup. This demonstrated that the French government believed that an enlightened despot could better achieve stability in Sweden than a parliamentary oligarchy and that adherence to Enlightenment ideals did not preclude Gustavus from imposing his monarchical authority over the Swedish government.

—Carolyn Harris

Both Charles III of Spain (r. 1759–1788) and Gustavus III of Sweden (r. 1771–1792) introduced reforms inspired by the Enlightenment in an attempt to consolidate their own authority at the expense of the nobility. Charles limited the privileges of wealthy sheep ranchers and sought to diversify the Spanish economy and increase foreign commerce. Gustavus, a nephew of Fredrick the Great, staged a military coup to break the authority of noble factions and increase the prestige of the Crown in 1772. Like Charles he revoked noble trade monopolies, thereby removing obstacles to foreign and domestic commerce. Noble opposition in both Spain and Sweden succeeded in reversing many of these reforms after the deaths of Charles and Gustavus. The revocation of innovations introduced by the enlightened despots undermined popular support for absolute monarchical rule, contributing to liberal and radical political movements in the late eighteenth and early nineteenth centuries.

Russia under Catherine the Great

The 35-year reign of Catherine the Great (1762–1796) was an age of lavish and sophisticated cultural life at court, tremendous military and political successes, and increased opportunities for the nobility. At the same time, however, it was a period of increased inequality and oppression for the serfs, state peasants, and ethnic minorities who made up the vast majority of the population. This was, of course, no accident. Catherine, like all absolutist rulers of the time, depended heavily on the nobility to preserve order and help administer the state, and the nobles’ cooperation depended on the maintenance of their privileges, especially the use of serf labor. Moreover, as a German princess who had married into the Romanov dynasty and then, after years of an unhappy marriage usurped the throne (and may have been complicit in the death of her husband), with the help of the first of numerous lovers, Catherine was even more dependent on the goodwill of the aristocracy. Thus, while she was free to exploit the opportunities that arose for expansion, she shunned any significant internal changes that might have alienated the nobility.

Portrait of Catherine the Great, by Dmitry Gregorievitch Levitsky, 1783. (Scala/Art Resource, NY)

Catherine cultivated the image of an enlightened ruler and was, in fact, well acquainted with many of the leading philosophers of the late eighteenth century, both personally and through their writings. In 1767 she established the Legislative Commission to revise Russian law and reorganize governmental administration; she even wrote a set of guidelines that was infused with liberal ideas. However, when the commission's deliberations led to bitter disagreements among representatives of the nobles, townsmen, and state peasants, she disbanded it and ignored most of its recommendations. The domestic changes implemented under Catherine were primarily administrative reforms that strengthened her personal power and the privileges of the nobility. The country was divided into 51 provinces, which in turn were composed of smaller districts, each having its own local council, courts,

and administration. While the Crown appointed provincial governors and certain district administrators, minor officials were to be elected by the local gentry, which included all those who enjoyed noble status as a result of landownership or government service. The privileges of the gentry were expanded in 1785 with the Charter of Nobility. Under this legislation, gentry were exempted from compulsory state service and direct taxation, free to dispose of their property (both land and serfs), permitted to operate industrial enterprises on their estates without payment of any license or fees, free from corporal punishment, and free to travel or live abroad.

The provisions that increased noble authority over serfs were in part a response to the Pugachev Revolt, which shook the country from 1772 to 1775. The rebellion began among Cossacks in the Ural region who were angry over their loss of autonomy and heightened military obligations. It quickly spread to neighboring regions as serfs and peasants joined in the hopes of ending their oppression. Only by ending a war with Turkey was the government able to marshal enough troops to crush the revolt. While the revolt highlighted the misery of the peasantry and the need to reduce the burdens placed on them by both the state and landlords, it strengthened the bond between Catherine's government and the nobility and made any such reforms impossible for nearly a century.

If Catherine proved cautious and later even reactionary in domestic affairs, she pursued an adventurous and highly successful foreign policy that resulted in territorial expansion in the south and west. While much of this success was due to the internal decay, division, and weakness of Russia's traditional adversaries, especially the Ottoman empire and Poland, it was also due to Catherine's skills and those of her advisers and generals. Russia successfully fought two major wars with the Ottomans and achieved its long-held goal of gaining complete access to the Black Sea. The First Russo-Turkish War, from 1768 to 1774, resulted in Russian conquest of the southern Ukraine, including the entire north coast of the Black Sea and the Crimea. The conquered territory was reorganized by G. A. Potemkin (1739–1791), who besides being Catherine's lover was an able administrator; numerous towns and ports

were established. The Second Russo-Turkish War, from 1787 to 1792, saw further Russian victories, but diplomatic pressure from other states, especially Austria and England, meant that Russia's territorial gains were limited.

During Catherine's reign, Russia also played a key role, along with Prussia and Austria, in the partitions of Poland. The Polish government was an elective monarchy in which the landed magnates competed fiercely for the Crown while appealing for support not only from the Polish gentry but also from neighboring rulers. This gave Catherine the opportunity to interfere in Polish affairs by making one of her former lovers, Stanislaw Poniatowski, the new king in 1764 and having herself declared protectress of the Polish-Lithuanian Commonwealth in 1768. When Poniatowski allied with various nobles to curtail Russian influence, Catherine used Russian troops to crush the rebellion and entered negotiations with Prussia and Austria. This led to the partition of Poland in 1772. When the French Revolution of 1789 inspired Polish reformers to once more try to transform the country's antiquated and inefficient political system,

Catherine and her fellow monarchs intervened again in 1792 and 1795, each time claiming more territory. By the third and last division in 1795, Poland disappeared completely from the map. For its part, Russia acquired nearly two-thirds of the former Polish state and made the territories an integral part of its greatly expanded empire.

■ Introduction: Revolts and Revolutions, 1770–1820

Revolts and revolutions both are violent reactions to perceived injustices and oppression, but otherwise the two political phenomena have little in common. Revolts tend to involve individuals mainly from a single socioeconomic group such as peasants, slaves, students, workers, taxpayers, soldiers, or inhabitants of a particular region. For this reason, participants in revolts seek the redress of grievances specific to their situation rather than a restructuring of society. Also for this reason, most revolts fail. Lacking broad support, revolts are quickly crushed or slowly subside and, at least in the short run, achieve few if any palpable results. Conversely, by definition, revolutions are successful. They bring about fundamental changes in the very nature of government, often the result of the transfer of power from one social

group to another. Their impact, furthermore, goes beyond politics. Legal systems, education, religious life, economic policies, the arts, and many features of everyday life also are affected.

The years between 1770 and 1820 had their share of revolts. Indians rose up against Spanish rule in Peru in 1780–1781, and Indian peasants and artisans, with some Creole support, rose up against new taxes in New Grenada (present-day Colombia) in 1781. Peasant rebellions were endemic in Russia, with Pugachev's Rebellion (1774–1775), which gathered support from disaffected religious groups and Cossacks, winning a number of victories before being suppressed by government forces. Many dozens of slave revolts occurred in Brazil, the sugar islands of the Caribbean, and the southeastern United States. But these years are mainly remembered not for

revolts but for revolutions, the most important of which, the American Revolution (1775–1783), the French Revolution (1789–1799), the Haitian Revolution (1791–1804), and the Latin American wars for independence (1808–1829), changed the course of political history.

These four Atlantic revolutions all were influenced by the intellectual ferment generated by the eighteenth-century Enlightenment, whose leading thinkers relentlessly criticized the divine right of kings, noble privilege, and religious oppression while promoting free trade, limited government, freedom of expression, constitutionalism, and popular sovereignty. Human beings, they asserted, need not passively accept the status quo but could use their reason to create a better social and political order. Although they shared this common vocabulary, each of the era's major revolutions was unique. Each grew out of varied circumstances, followed distinct paths, and had different results. All were important. Each one of them contributed to the acceptance of a new set of values and assumptions that ushered in a new age in politics.

The American Revolution began officially with the writing of the Declaration of Independence, a ringing endorsement of the principles that all men are created equal and that oppressed peoples have the right to abolish any government that does not protect its subjects' basic rights. After their military victory over Great Britain in 1781, the leaders of the new nation embraced republicanism rather than monarchy, issued a bill of rights, and adopted a constitution based on the principles of federalism and the separation of executive, legislative, and judicial power.

Unlike the American Revolution, which focused mainly on politics, the French Revolution centered on social issues, in particular the achievement of legal equality for all citizens in a society that for centuries had favored the interests of the privileged nobility and clergy. It also was more ambitious in its determination to break from the past. In its most radical phase in 1793 and 1794, revolutionary leaders sought to eradicate all vestiges of the old regime by adopting the metric system, renaming the months and days of the weeks, and abolishing Christianity. When attacked by Prussia, Austria, and other

powers bent on overturning the revolution, the French people rose up to defend their revolution with a patriotic spirit that introduced nationalism as a potent factor in war and politics.

The Haitian Revolution ended French rule over St. Domingue, whose 500,000 slaves produced great quantities of sugar and coffee and made up almost 90 percent of the colony's population. What began as a slave rebellion ended in the founding of the new state of Haiti, the second independent republic in the Americas. The Haitian Revolution inspired slave rebellions in Jamaica and the American South, strengthened the nascent abolitionist movement, and gave hope that even for the most downtrodden people oppression was not their inevitable lot.

The Latin American wars for independence resembled the American Revolution in that political changes, which resulted in the formation of a dozen new republics and one monarchy (Brazil), were not accompanied by significant social transformations. In the United States this meant the preservation of slavery and the continuation of a relatively egalitarian social order among whites. In Latin America it meant the preservation of not only slavery but also of a large politically impotent and economically exploited Indian population, a powerful and privileged Catholic Church, and the political domination of a class of wealthy white landowners. Despite these limitations, the successful independence movements in Latin America strengthened the idea that a new era in politics had begun, one in which revolutions could play a central role.

—James H. Overfield

Late-Eighteenth-Century Rebellions in Latin America

Traditional interpretations have portrayed the native populations of the Americas as passive in their response to the Spanish conquest and subsequent colonization. This view has been challenged by recent scholarship that reveals that indigenous peoples resisted Spanish rule through revolts, relocation, and sabotage. Revolts, many of which started in the aftermath of the conquest, were the most consequential form of resistance. The first revolt of the Incas led by Manco II in 1536, the Mixton War (1540–1542) in Mexico,

and the great uprising by the Maya of Yucatan in 1546 are but several examples of fierce early resistance on the part of native populations.

The seventeenth century was relatively free of popular uprisings, but there was a revival in the eighteenth century brought on by additional taxes and other burdens resulting from administrative and fiscal reforms instituted by the Bourbon government. The Bourbon reforms were implemented to improve the efficiency of the Spanish empire in extracting wealth from the Americas. They generally benefited large landowners, commercial interests, and mine owners but further impoverished the masses. From the 1740s to the 1780s these policies led to numerous revolts, the two largest and most violent of which took place in Peru and New Granada.

The revolt in Peru was led by José Gabriel Condorcanqui, an Indian cacique (chief) who assumed the name of Tupac Amaru II, thus linking his movement to the last Inca, Tupac Amaru I (1554–1572). (“Inca” meant ruler of the empire, but the Spanish mistakenly referred to the whole empire as Inca.) The causes of the Great Andean Rebellion were abuses of the Indian population by Spanish royal officials. These included the *mita* (labor drafts), *repartos* (the forced purchase of inferior and unwanted products), and Indian taxes. From 1777 to 1780 Condorcanqui appealed to imperial officials to end the abuses. When he saw that there would be no redress, he seized the *corregidor* (magistrate) of the province of Tinta and later hanged him. Within weeks, more than 40,000 Indians joined his revolt. On November 18, 1780, the rebel army attacked the town of Sangarara and massacred approximately 600 people.

Condorcanqui's rebellion inspired other uprisings throughout the Peruvian highlands, resulting in the destruction of haciendas and *obrajes* (sweatshops), where workers were forced to work under austere conditions and for long terms. This impeded not only their liberty but family life as well. Condorcanqui appealed to Peruvian creoles and mestizos to join the revolt, but this did not materialize. Instead, creoles and mestizos alike became victims of the Indians' wrath, which included the burning of churches, massacres, and destruction of property and public works. The turning point in

José Gabriel Condorcanqui, or Tupac Amaru II, led the famous 1780 rebellion against Spain's rule in Peru. (Daniel Laine/Corbis)

the revolt came during January 8–10, 1781, near Cuzco when forces loyal to the Crown routed the rebel army. On April 6, 1781, Condorcanqui was captured in the mountains near his home town of Tinta. He was later forced to watch the execution of his wife and one of his sons. Condorcanqui was then brutally executed by being lashed to four horses that were sent to the four points of the compass. Following his execution, the revolt became even more radical and bloody as new leaders attempted to mobilize all Indian males into a war to the death. Reinforced Spanish troops eventually prevailed, and the revolt petered out during the first six months of 1783.

The Comunero Revolt, which started in 1781 in New Granada (present-day Colombia), was also brought on by desperate economic conditions linked to Bourbon reforms. However, this revolt was more limited in scope. The revolt centered on specific grievances, including the sales tax, forced sales of merchandise, new taxes

on tobacco, and a head tax. The insurrection broke out in the colonial town of Socorro, an important agricultural center in northern New Granada, where a central committee, or *común*, had been elected to represent the peasants and artisans of the town and the nearby region. Other towns also elected committees, and representatives were known as *comuneros*, which soon became the name for the revolt.

Creoles were involved in some leadership roles, but the masses of *comuneros* were comprised of Indians and mestizos. A mass march was organized on the Viceregal capital of Bogotá to present the demands of the *comuneros*, including reduction in tribute and sales taxes for Indians and mestizos, return of confiscated lands, repeal of the new tobacco tax, and preference for creoles in official church and government appointments. In an effort to buy time, Spanish officials agreed to these demands. However, when the bulk of the rebel army had disbanded, the Spanish announced that the agreement was null and void since it had been signed under duress. Only one rebel leader, José Antonio Galán, was canny enough to keep his rebel band armed and ready. Galán continued armed resistance but was ultimately captured by the Spanish and executed on January 30, 1782. His death ended the revolt of the *comuneros*.

Although directed against perceived abuses and injustices in Spain's colonial regime, Condorcanqui's rebellion, the Comunero Revolt, and the many other smaller rebellions that occurred were not previews of the later wars for independence. Rebel leaders repeatedly professed their loyalty to the Crown and the Church. In the view of some historians, the violence and class warfare of the rebellions may have even delayed the independence movement by strengthening the alliance between the creole elite and Spanish authorities.

Pugachev's Rebellion

One of the largest peasant revolts in European history, Yemelyan Pugachev's rebellion had a lasting influence on Russian history. By the mid-eighteenth century Russia emerged as a first-rate European power after the wide-ranging and radical reforms of Peter the Great. As the empire sought to modernize itself the status of the peasantry declined, while the Russian monarchs confirmed the authority of nobles over their serfs in return for the nobles' political cooperation. Heavy taxation, abuses, and arbitrary treatment caused peasant anger to run high and led to multiple peasant revolts throughout the 1750s and 1760s. Although the Russian imperial government suppressed these revolts, the peasant agitation soon culminated in Pugachev's Rebellion between 1773 and 1775.

The son of a Don Cossack, Yemelyan Pugachev was born in the early 1740s and participated in the Seven Years' War (1756–1763)

Yemelyan Pugachev was a disaffected Russian army officer who in 1774–1775 led the most serious mass uprising in early modern Europe prior to the French Revolution. Claiming to be the murdered tsar Peter III, he attracted support from peasants and religious dissenters before his movement was crushed by tsarist forces. (Library of Congress)

► PUGACHEV AND REFORM

The results of Pugachev's Uprising were far reaching and far from favorable to the lower classes in Russia. Early in her reign Catherine the Great toyed with the idea of liberal reform in the spirit of the Enlightenment movement, but Pugachev's Uprising marked a turn toward more conservative policies. It signaled a closer alliance between the Crown and the gentry to secure their political power and social standing. In response to the collapse of regional authority during the revolt, the empress launched a thorough administrative reform, which disregarded historical and regional considerations to create new administrative units of provinces (*gubernia*). Catherine the Great also accelerated the incorporation of the gentry, which culminated in the Charter of the Nobility of 1785. The charter confirmed earlier

privileges and exemptions of the nobility and added new ones that enhanced the nobility's status and extended their authority over the peasantry. This in turn strengthened serfdom, which also spread to new regions, especially to the Ukraine. As a result of these changes, the census of 1794–1796 revealed the growth of serfdom, with serfs constituting more than 53 percent of peasantry and almost half of the entire population of the Russian Empire. Stricter controls were established over the Cossacks, and the autonomy of the Don and Ural Cossack hosts was limited. Catherine the Great, however, sought to combine coercion with limited reforms, which she advocated in the last two decades of her reign.

—Alexander Mikaberidze

when Russia dispatched Cossack forces into Prussia. In later years Pugachev took part in the Russo-Turkish War of 1768–1774, earning promotion to a junior officer rank in 1770. After the war he abandoned military service and, for the next few years, led an impoverished existence in the Kuban and Southern Ural regions, where he witnessed popular unrest against serfdom. In February 1772 he was arrested as a deserter but escaped and later found shelter with the Old Believers religious sect. In January 1773 he again was arrested and sentenced to exile in Siberia but managed to escape in May. Over the next few months he organized an insurrection of the Yaik Cossacks that ignited the flames of a full-blown insurrection in the Ural region.

Pugachev assumed the name of Emperor Peter III, who was killed during the coup d'état that his wife Catherine (now Empress Catherine the Great) organized in the summer of 1762. Pugachev claimed that he, or "Peter III," had escaped the plot and had been hiding for the past ten years awaiting an opportune moment to reclaim his throne. The revolt quickly spread through the region where peasants and laborers at various ironworks in the Ural region protested intolerable conditions of bondage and exploitation. However, not all workers joined

the rebellion, and some even fought against Pugachev's troops. In general, the revolt appealed to peasantry and workers as an opportunity to take revenge for all they had suffered, striking out against a social order in which they saw nothing but abuse and oppression. In his famous manifesto, Pugachev promised that "noblemen will no longer exploit the peasants by making them do onerous work and pay heavy taxes, for all men will be free and independent." He promised to grant to those who followed him land and threatened punishment and death to those who opposed him. These promises appealed to a wide range of social classes (such as serfs, workers in various sectors, and priests) and ethnic groups (such as Tatars and Bashkirs) who gradually joined the revolt. Despite his own illiteracy, Pugachev recruited local priests and clerks to prepare his royal decrees.

Throughout the autumn of 1773, Pugachev created a governing apparatus to direct his growing number of supporters and organized a military force. By December his troops amounted to some 25,000 men with 86 cannon. After capturing several fortified points in the Yaik region, Pugachev's rebels besieged the fortress of Orenburg. Various detachments were sent to the neighboring provinces, raiding

Yekaterinburg, Chelyabinsk, and Samara. The rebels seized more than 90 factories and works that accounted for almost three-quarters of all industry in the Ural region. However, Pugachev failed to exploit this manufacturing capacity for his own good since many factories were looted and workers refused to work and instead chose to join Pugachev's army.

By now the imperial government began to pay attention to the unrest that it earlier had dismissed as nonconsequential. At the end of 1773 General Alexander Bibikov was appointed to lead a retaliatory army and forced Pugachev to raise the siege of Orenburg. The rebels instead moved to the east and in July 1774 seized the town of Kazan, which further alarmed the imperial authorities. Attacked by the government forces, Pugachev then retreated to the Volga region, spreading revolt to Penza, Tambov, and Nizhni Novgorod provinces. The imperial government, after hastily concluding a peace with the Ottoman Empire, shifted its military forces, led by Generals Michelson, Suvorov, and Bibikov, to suppress the growing unrest. In August 1774 Pugachev unsuccessfully besieged Tsaritsino and suffered a series of defeats, which turned the tide of war in favor of the empire. The demoralized rebels began to dissipate and abandon the cause, while Pugachev himself was seized by his own men in September 1774 and handed over for a bounty of 100,000 rubles. Transported in an iron cage to Moscow, Pugachev was tried and executed in a brutal manner on January 21, 1795.

The White Lotus Rebellion

The White Lotus Rebellion refers to anti-Qing rebellions in China that began in the 1770s and continued until 1804. Famine, population pressures, tax increases, and perceived harassment by government officials led to the uprisings. The White Lotus Rebellion was notable, however, both for the long-standing cult that promoted it and because it began in central China rather than among the minority populations of outlying provinces.

The origins of the White Lotus society lay with a Buddhist cult of the thirteenth century. Members of the White Lotus never resigned themselves to Manchu rule under the Qing dynasty (established in the seventeenth century), but it was not until the 1770s that an organized uprising took place. In 1774 a martial arts and herbal healing expert named Wang Lun led a group of rebels against the Qing. Wang Lun drew from the peasant population of Shangdong Province, to the south of Beijing. Other participants in his forces included barge pullers, coolies, and other urban people who worked along the Grand Canal that connected Nanjing and Beijing.

Wang Lun called on the “Eternal Venerable Mother” goddess, an important deity in traditional folk-Buddhism. His ideology was millenarian, calling attention to catastrophe on earth rather than advocating such political goals as land reform or help for the poor. He was able to convince his followers that he was immune to Qing reprisals, however, and in the early days of his revolt this seemed true. His forces captured several cities including Linqing, an important city on the Grand Canal. A massive response from the imperial armies soon crushed Wang Lun's following, however, slaughtering them along with their families.

Because the government did not do anything about the underlying causes of the discontent, Wang Lun's defeat did not put an end to disorder in Shandong. Again in 1796, White Lotus rebels rose up. For the most part, the rebellion consisted of sporadic anti-Qing violence by roving bands using guerrilla tactics. Yet by this time, the government forces had become riddled with corruption and could not defeat the movement that lasted until 1804.

The American Revolution

Political issues during the period leading to the American Revolution fall into two main categories: relationships between the American colonies and Great Britain and relationships among the American colonies. The breakdown in British-American relations proceeded largely from British attempts to raise revenue in the colonies through a series of taxes passed by Parliament. The economic and political roots of the American Revolution are thus tightly interwoven.

The British government had expended considerable funds in the Seven Years' War, known in the United States as the French and Indian War (1754–1763); as a result of the British victory over the French, Great Britain, according to the provisions of the Treaty of Paris, gained control of

vast new North American territories, including Canada. However, the British had paid a price for their victory in terms of adding substantially to their government's national debt. They also faced expenses from having to administer and defend their newly gained territories. Beginning with the Sugar Act (or Revenue Act) in 1764, Prime Minister George Grenville, in cooperation with Parliament, attempted to raise funds in America to help reduce government debt and to defray the expense of maintaining British troops in America. From the British point of view, such taxation was justified: the French and Indian War was fought partly to shield the American colonies from French threats, and British troops in America continued to play a protective role.

American colonists rejected such arguments. They disliked the Sugar Act and protested hotly against the Stamp Act (Duties in American Colonies Act, 1765), which required colonists to pay a tax on every sheet of paper used for legal papers, ships documents, newspapers and other publications, licenses, and even playing cards. Revenues from the tax were to be used to help pay the costs of defending and protecting the new American frontier near the Appalachian Mountains. Nonetheless, Americans found the new tax repugnant not because of its costs but because of its implications. From the colonial

THE VIRGINIA RESOLVES

On May 30, 1765, upon learning of the Stamp Act, the Virginia House of Burgesses, in what came to be known as the Virginia Resolves, spelled out its opposition to the new tax:

“Resolved, That the first Adventurers and Settlers of this . . . Dominion of Virginia brought with them, and transmitted to their Posterity . . . all the Liberties, privileges, Franchises, and Immunities that have at any Time been held, enjoyed, and possessed, by the People of Great Britain.

Resolved, That by the two royal Charters, granted by King James the First, the Colonists aforesaid are declared entitled to all Liberties, Privileges, and Immunities of Denizens and natural Subjects, to all Intents and Purposes, as if they had been abiding and born within the Realm of England.

Resolved, That the Taxation of the People by themselves, or by Persons chosen by themselves to represent them, who could only know what Taxes the People are able to bear, or the easiest method of raising them, and must themselves be affected by every Tax laid on the People, is the only Security against a burdensome Taxation, and the distinguishing characteristic of British Freedom, without which the ancient Constitution cannot exist.”

THE AMERICAN REVOLUTION

point of view, previous British taxes—the Navigation Acts (a series of laws which restricted the use of foreign shipping for trade between Great Britain and its colonies) and the Molasses Act of 1733 (which required colonists to buy more sugar from the British West Indies rather than cheaper French West Indian sugar)—had

been intended to regulate trade and protect British commerce. They also had been loosely enforced. The Stamp Act, however, was viewed as a direct attempt by England to raise money in the colonies without the approval of colonial legislatures. The door now seemed open to similar taxes in the future.

Critics of the colonists pointed out that older British taxes were only lightly enforced; the colonists thus appeared to reject any form of real British taxation. Nevertheless, the colonists maintained that as British subjects, they had to consent to their own taxation; because the colonies were not represented in Parliament, Parliament had no right to tax them. British apologists responded with the notion of “virtual representation,” namely, that while many subjects of the crown in both Britain and America did not vote directly for members of Parliament, the body of Parliament acted to represent all British subjects.

The Americans were not convinced, and a series of protests and riots against the Stamp Act exploded across America. Colonial legislatures lodged formal protests with the London government. American boycotts of British goods put considerable pressure on British merchants, and led to the repeal of the Stamp Act and the Sugar Act in 1766. However, at the same time, Parliament passed the Declaratory Act, reasserting its sovereignty over the colonies in all matters, including taxation. Subsequent Parliamentary attempts to tax the colonies—the Townshend duties of 1767, the Tea Act of 1773—were also rejected by the Americans.

The taxation issue led to other points of conflict between the Americans and the British government. Colonists objected to the Quartering Act (1765), which mandated that they shelter British soldiers stationed in America. Indeed, as tensions grew, Americans increasingly resented the presence of British troops; the Boston Massacre of 1770 occurred as a result of colonial mob action. However, the most striking conflicts occurred after the “Boston Tea Party” of 1773, when colonists boarded three ships laden with taxed tea and dumped the tea into the harbor. Parliament responded harshly to the destruction of British property and the challenge to Parliamentary sovereignty; it passed the Coercive Acts (1774), closing the port of Boston, restricting Massachusetts’ self-government, and increasing the prerogatives of British forces in America. The Quebec Act, passed the same year, attached the rich Ohio River Valley to Quebec and maintained existing political and religious structures in French Canada, including the Catholic Church. American colonists bitterly resented the rejection

of their claims to the Ohio Valley, as well as the protection of Roman Catholics in Canada.

The tensions between Britain and the American colonies created an increasing sense of unity among those colonies. The Stamp Act Congress, held in New York in October of 1765, had included representatives from 9 colonies; it made formal statements of loyalty to the Crown but lodged official protests against Parliament’s taxing authority. Nine years later, in September 1774, the First Continental Congress met in Philadelphia in response to the Coercive Acts. It included delegates from all colonies but Georgia, and ultimately adopted the Suffolk Resolves, a firm rejection of British regulations on colonial trade. In addition, the Congress laid the foundations for a formal boycott of British goods and an embargo on American exports to Britain. Finally, in May of 1775, after the battles of Lexington and Concord, the Second Continental Congress met in Philadelphia. This body included representatives of all 13 colonies and took control of the growing conflict and the Continental Army. Although characterized by considerable internal disagreement, the Congress unanimously issued the Declaration of Independence in July 1776 and directed the American war effort to the end of the American Revolution.

The Founding of the United States of America

In 1783 the Peace of Paris ended the American Revolution and recognized the independence of the Thirteen Colonies from Britain. The leaders

The U.S. Constitution is signed on September 17, 1787 at the Constitutional Convention in Philadelphia. The Constitution was drafted by legislators in Philadelphia between July and September 1787. Painting by Henry Hintermeister, 1925. (Library of Congress)

of the new United States labored to fashion a central government on a republican model; they were determined to avoid the dangers of an encroaching tyranny from either a centralized power or mob rule. Heir to the Enlightenment critique of monarchy and alert to the danger of an oppressive government, the Continental Congress in 1777 had adopted the Articles of Confederation, which established a central government with minimal power and was ratified by the states in 1781. The central government could declare war, borrow money, and make treaties with foreign nations but could not tax the states, raise an army, regulate interstate and foreign trade, or create a federal judiciary. The central government could persuade and encourage but could not compel the states to do anything because the articles guaranteed their sovereignty and reserved to them all power not expressly delegated to Congress. The problems inherent in the Articles of Confederation eventually allowed Federalists, such as Alexander Hamilton, to successfully promote a democracy with a strengthened central authority.

Unable to collect taxes and with little reserve in specie, the central government met its obligations by printing notes that it promised to redeem in the future for specie. Each issuance of notes made more unlikely the promise of redemption, and inflation was the result. By 1783,

146 paper dollars were worth only \$1 in coin. With paper money nearly worthless, creditors seized the assets of debtors. In 1786 a band of farmers in Massachusetts, fearful of losing their farms, marched on courthouses, closing them down to prevent foreclosures.

Unhappy with this turbulence and with the inability of the central government to enact reforms without the consent of all the states, George Washington, James Madison, and other leaders gathered in Annapolis, Maryland, and urged the Congress to call a constitutional convention to revise the Articles of Confederation. Congress endorsed this proposal in early 1787, and later in the year 55 men from 12 states met at Philadelphia to create a new central government. The fruit of the Philadelphia convention was the U.S. Constitution, which the states ratified in 1788. The Constitution provided for three branches of government. Congress, composed of the Senate and the House of Representatives, had the power to collect taxes, regulate interstate and foreign trade, raise an army, establish a national currency, and create the lower courts. All these powers had been denied to the central government under the Articles of Confederation. The president, the head of the executive branch, had the power to command the army, make treaties with foreign nations subject to congressional approval, veto legislation, and appoint people to the executive branch and to the judiciary subject to congressional approval. The Supreme Court headed the judiciary and had the power to resolve disputes over the meaning of the Constitution. To placate anti-Federalists such as Patrick Henry, who were fearful of allowing the central government greater power over states and individuals, the Bill of Rights, which protected individual liberties, was added to the new Constitution.

The Constitution also reflected compromises regarding representation and sectional disputes. First the framers struggled over how to weigh population. Delegates of populous states wanted Congress to apportion representatives by population, whereas delegates of small states wanted equal representation in Congress. These factions compromised by allotting equal representation in the Senate and by apportioning representatives by population in the House of Representatives. Second, slavery also was a divisive issue.

➤ ALEXANDER HAMILTON—THE NEED FOR A STRONG CENTRAL GOVERNMENT

In 1787 and 1778 Alexander Hamilton, John Jay, and James Madison published a series of brilliant essays known as *The Federalist* in defense of the Constitution. The following excerpt comes from Federalist Paper Number 1, written by Hamilton:

“After full experience of the insufficiency of the existing federal government, you are invited to deliberate upon a new Constitution for the United States of America.

The subject speaks its own importance; comprehending in its consequences nothing less than the existence of the UNION, the safety and welfare of the parts of which it is composed, the fate of an empire in many respects the most interesting in the world. It has been frequently remarked that it seems to have been reserved to

the people of this country to decide by their conduct and example the important question whether societies of men are really capable or not of choice, or whether they are forever destined to depend for their political constitutions on accident and force. If there be any truth in the remark, the crisis at which we are arrived may with propriety be regarded as the period when that decision is to be made; and a wrong election of the part we shall act may, in this view, deserve to be considered as the general misfortune of mankind.”

The Essential Federalist and Anti-Federalist Papers, ed. David Wootton (Indianapolis: Hackett Publishing, 2002), 140.

Northerners wished to exclude slaves from the census and thus from influencing the number of representatives in the House, whereas Southerners wanted slaves to be counted in full. Despite this difference, neither Northerners nor Southerners intended to enfranchise slaves. As a compromise, delegates adopted Pennsylvania delegate James Wilson’s suggestion to count each slave as three-fifths of a person. Despite the wrangling over slavery, the terms “slave” and “slavery” do not appear in the Constitution.

Slaves were not alone in being unable to vote. Women likewise could not vote, and most states barred white men who did not own property. Yet the trend toward broad participation in the electoral process gained momentum in the early republic. The states formed from the Northwest Territory adopted constitutions that enfranchised all men. Mississippi, Alabama, and Florida enfranchised all white men, and New York, Massachusetts, Rhode Island, Delaware, and Maryland dropped their requirement that men own property to vote.

With a stable political system, vast tracts of land, and a bustling commerce, the United States attracted immigrants in search of opportunity. These new Americans believed that they could achieve their dreams through hard work. The United States had no aristocracy, no class

barriers, and no traditions to mar the aspirations of ambitious newcomers. The founding of the United States created more than a polis; it created a land of possibilities.

The Origins and Early Stages of the French Revolution

One of the great events in world history, the French Revolution has attracted and repelled in equal measure. With results ranging from the Declaration of the Rights of Man and the Citizen to the Terror, it was the best of times and the worst of times, as Charles Dickens memorably put it. For better or for worse, the French Revolution laid the foundations of modern politics, creating concepts and terms still employed today.

THE CONSTITUTION OF SEPTEMBER 3, 1791

In September 1791 the National Assembly approved a new constitution for France. The following excerpts from the preamble and the first section set forth the basic principles of the revolution's early moderate phase.

"The National Assembly . . . abolishes irrevocably the institutions which were injurious to liberty and equality of rights.

Neither nobility, nor peerage, nor hereditary distinctions, nor distinctions of orders, nor feudal regime, nor patrimonial courts, nor any titles, denominations, or prerogatives derived therefrom . . . any longer exists. . . .

The Constitution guarantees as natural and civil rights:

1st, That all citizens are admissible to offices and employments, without other distinction than virtues and talents;

2nd, That all taxes shall be assessed equally upon all citizens, in proportion to their means;

3rd, That similar offences shall be punished with similar penalties, without any distinction of persons.

The Constitution guarantees likewise as natural and civil rights:

Liberty to every man to come and go without being subject to arrest or detention . . . ,

Liberty to every man to speak, write, print, and publish his opinions without having his writings subject to any censorship or inspection before their publication, and to worship as he pleases;

Liberty to citizens to assemble peaceably and without arms in accordance with police regulations; . . .

The legislative power may not make any laws which infringe upon or obstruct the exercise of the natural and civil rights recorded in the present title and guaranteed by the Constitution; . . .

Citizens have the right to elect or choose the ministers of their religions. . . ."

—James H. Overfield

Few observers in the 1780s predicted the demise of absolute monarchy in France. Certainly none of the leading intellectuals connected with the French Enlightenment, many of whom were harsh critics of the inequalities and inefficiencies of eighteenth-century French society, were calling for or envisioning so radical a restructuring of the nation's legal and political structure. Yet it is the weaknesses rather than strengths of the French Crown that stand out as the major cause of the revolution. Finance and administration were chaotic, there was no proper budgeting, and the famous *compte rendu* ("statement of accounts"), published by Finance Minister Jacques Necker in 1781, was the first time that any figures had been produced, even if they were misleading and deliberately designed to attract fresh loans. The monarchy had become dependent on borrowing to survive. Reducing expenditure proved to be impossible, not because of a bloated court but on account of century-long military commitments that engaged France in a battle for both continental and maritime

hegemony. When it managed to separate these two commitments and fight an essentially naval war, as in the American War of Independence (1775–1783), France succeeded in defeating its long-standing enemy, Britain, for the first time in a century. Yet the financial strain was immense, and the aftermath of the war demanded urgent reforms, which ministers were unable to deliver. Belying the absolutist principle, the tax system only functioned with a measure of consent from various privileged and provincial bodies, according to the traditional, unwritten constitution. Controller General Charles-Alexandre de Calonne convened an Assembly of Notables in 1787, hoping that it would underwrite his proposals for fiscal and administrative reform, but even this handpicked body proved obstructive. A more authoritarian approach was adopted, but it produced stiff resistance. The monarchy was obliged to back down and recall the long-dormant Estates-General, a representative assembly dating back to the Middle Ages that had last met in 1614.

The old monarchy was not overthrown; rather, it collapsed as a result of its own shortcomings. The question was, what would replace it? For most Frenchmen the Estates General was too antiquated to serve a modern parliamentary function. Its division into three chambers, for clergy, nobility, and the Third Estate (everyone else from wealthy financiers to lowly peasants), provoked controversy during the winter of 1788–1789, for it appeared to give the first two orders a built-in majority over the Third Estate. Each estate would have the same number of delegates, each would meet separately, and each would cast one vote, meaning that the two “privileged orders”—the clergy and the nobility—would always have an advantage. This led to a campaign to “double the third” and have voting by head rather than by order. The campaign produced the famous pamphlet by Abbé Sieyès, “What Is the Third Estate?” He wrote, “What Is the Third Estate? Everything. What Has It Been Until Now in the Political Order? Nothing. What Does It Want To Be? Something.”

The issue was still unresolved when the Estates General met at Versailles in May 1789, and it was ultimately a group of delegates, mostly but not exclusively from the Third Estate, who decided to break the deadlock and declare themselves the National Assembly, with the task of writing a new constitution for France. The king and many nobles naturally demurred, but growing unrest in town and country, which owed a good deal to harvest failure and high bread prices as well as the unprecedented political situation, brought riots that worked to the advantage of the National Assembly by persuading their opponents to call off countermeasures. The taking of the Bastille in Paris on July 14 was symbolically significant, but in order to pacify rebellious peasants, a more important event took place on the night of August 4, when liberal nobles and clergy rose one after another to renounce and outlaw their numerous legal privileges. At this point the term “ancien régime” was coined to describe the former state of affairs, now swept away.

It seemed that a new era was dawning, not just for France but for the world as a whole; the Declaration of the Rights of Man and of the Citizen issued later in August 1789 was cast in

universal terms. The French Revolution assumed a European dimension from the outset, inspiring admiration in many quarters and posing an implicit challenge to the old order everywhere. Virtually every institution in France awaited reform, and turning principles into practice was a huge undertaking. Ordinary people were anxious for real reform, yet the consensus in favor of change did not prevent the emergence of deep disagreements over its precise configuration. The bitter debate over the king’s role as a constitutional monarch is a good example. The debate led to Louis XVI’s attempt to flee the country in 1791, confirming suspicions that he rejected the French Revolution. A split within the Catholic Church, the subject of substantial reform, forced thousands of dissident clergy into opposition, while even priests who accepted the Civil Constitution of the Clergy became increasingly suspect.

In this atmosphere, external affairs had a decisive impact on the development of the revolution. The emperor of Austria was naturally concerned that his brother-in-law (Louis) and sister (Louis’s queen, Marie Antoinette) were at risk, while other countries bordering France offered haven to aristocratic emigrés, many of them military officers. The revolutionaries took the plots and proclamations of these aristocrats and their foreign supporters at face value, worried that they would attract support among dissidents inside France. As a result, the prospect of war increasingly appealed to revolutionary politicians as a means of flushing out traitors and uniting patriots behind the revolution. There were few objections when in April 1792 the French parliament declared war on Austria and Prussia. Early defeats, however, brought deeper division rather than unity. The search for a scapegoat inevitably indicted the king, and on August 10, 1792, as Prussian invasion menaced the capital, the people of Paris stormed the Tuileries palace; Louis was dethroned and incarcerated for his own safety. With him fell the constitutional monarchy and all hope of a moderate settlement.

The French Revolution now became increasingly radical and violent. It was overshadowed by the war, which initially took a turn for the better in September 1792 and then worsened as Britain and the maritime powers joined the

anti-French coalition early in 1793. By then Louis had been executed, but his death did nothing to unite opposing factions in the new National Convention, which was elected on the basis of virtually universal male suffrage in September 1792. On the contrary, the fate of the king drove individuals further apart, and the war raised the stakes by turning dissenters into traitors. Hope of establishing a democratic regime was dashed in the summer of 1793, when the regime faced a combination of civil war and invasion. The Republic was thoroughly beleaguered, with foreign troops massed on every frontier while Britain ruled the waves. Major cities outside Paris revolted against the dictatorship of the capital after Jacobin radicals in the Convention purged rival deputies with the assistance of lower-class militants. Several parts of the countryside were also in flames, notably the west where an area known as the Vendée, which was seething with religious tension and conflict between urban and rural dwellers, experienced a bloody uprising triggered by hostility to the military draft.

The odds seemed overwhelming, but the Republic benefited from its enemies' divisions: only once, at Toulon (where local royalists welcomed the British Royal Navy), did foreign and domestic opponents make common cause. Republicans resorted to a policy of coercion known as the Terror. One might describe the emergency powers that galvanized the government as a "war dictatorship," mobilizing the country's resources in unprecedented fashion. Instead of the weak executive that had replaced the monarchy, a Committee of Public Safety was created, made up of 12 deputies from the Convention. They ruled by decree and oversaw the representatives on mission, who were dispatched to the provinces to control local authorities. There was a growing inclination to employ the weapons of repression: imprisonment by watch committees and execution by Revolutionary tribunals or military commissions.

Given the manpower employed in suppressing internal revolt, not to mention duty on the frontiers, much effort during 1793–1794 was devoted to recruiting and supplying a vast army of approximately 750,000 men. This mass levy, which placed the resources of the nation at the disposal of the government, drew on the vast

demographic reserves that had never been harnessed effectively. A series of talented generals rose from the ranks to replace the old noble officer corps. The tide of war duly turned, and by the spring of 1794 there were calls for a slackening of the repression. By now, however, the Terror had acquired its own momentum, and there were some, like Maximilien Robespierre, who saw it not simply as a means of defending the revolution but also as a means of raising it to new heights. The past year's supreme sacrifices, so they thought, would usher in utopia.

The Reign of Terror

From June 1793 to July 1794, a period sometimes referred to as the Montagnard Dictatorship, the radical Montagnards dominated the Convention and controlled government. They implemented radical policies to stabilize the country amid civil strife and foreign invasion. The civil war in Brittany and Vendée (western France) continued unmitigated, forcing the government to divert substantial forces there. The Girondins who escaped persecution in Paris incited the so-called Federalist Risings in major cities in Normandy and Provence. In August 1793 in a major blow to the Revolutionary government, the Federalists surrendered the strategic port city of Toulon and the entire French Mediterranean fleet to the

British. Meanwhile, the Prussian and Austrian armies threatened France from the north and northeast.

To deal with these threats, the Montagnards issued the *levée en masse* (August 1793), which mobilized the resources of the entire nation to fight the revolution's enemies and in doing so transformed the nature of military conflict. The decree proclaimed that "all Frenchmen are in permanent requisition for the services of the armies. The young men shall fight; the married men shall forge arms and transport provisions; the women shall make tents and clothes and shall serve in the hospitals; the children shall turn linen into lint; the old men shall betake themselves to the public squares in order to arouse the courage of the warriors and preach hatred of kings and the unity of the Republic." Eager citizen-soldiers poured into the French armies, helping to turn the tide of war.

In September 1793 Terror was made into official government policy, and extreme measures were adopted to implement radical economic and social programs. The Constitution of 1793, although never implemented, provided for direct representative democracy with a guarantee of universal manhood suffrage. The Law of the Maximum introduced state control over prices and wages. Rudimentary social security was provided under the Law of 22 Florial (May 11, 1794), which promised a small income and free housing to the aged, ill, or disabled. The Decrees of Ventôse (February–March 1794) confiscated the property of emigrés and "recognized enemies" of the nation, which was then distributed to the socially disadvantaged. Plans were laid to create a free public education system, with elementary education compulsory for all.

While professing democratic ideals, the Montagnards governed dictatorially. Special legislation was passed limiting civil liberties and expanding the government's authority. In September 1793 the Law of Suspects made it possible to arrest any person who, by their conduct, associations, talk or writings, had shown themselves partisans of tyranny or federalism. The Committee of Public Safety, a 12-member executive committee with vaguely defined powers and under the leadership of Maximilien Robespierre, assumed the executive power,

➤ DEATH OF MARAT

Jean-Paul Marat was a radical leader of the French Revolution whose popular political writings addressed broad conspiracies and demanded the execution of political enemies. He was the leader of the Montagnards, the most radical wing of the National Convention, and was known for ruthless attacks in the power struggle against the moderate Girondins. As depicted in Jacques-Louis David's famous 1793 painting *Death of Marat*, on July 13, 1793 Charlotte Corday stabbed Marat to death in his bath. Corday, a Girondin supporter, held Marat responsible for the Reign of Terror, declaring during her trial that she killed not a man "but a wild beast that was devouring the French people."

while the Revolutionary Tribunal rendered swift but hardly impartial justice. The representatives on mission were sent to provinces and armies, wielding supreme political and military authority.

The Montagnards were themselves divided over the extent of social reforms, with some calling for further equalization of wealth. The middle-class leaders, however, felt that these changes violated the sanctity of private property and vehemently opposed them. One of the most lasting reforms of the Montagnard government was the adoption of the unified metric-decimal system of weights and measures, which remains in use to the present day.

The Montagnards used the Terror for a partisan political purpose as well as a means of stabilizing the country. They attacked their rivals and succeeded in executing early leaders of the Revolution, members of the royal family, feminists, and the leading Girondins, decapitating their most dangerous opponents. The executions were used to eliminate any threat to the Revolutionary government, and the bloody blade of the guillotine became a grisly symbol of this turmoil. The total number of executed remains unknown and varies from as low as 14,000 to as high as 40,000. Contrary to popular view, most of the people executed were not aristocrats and priests but rather workers and peasants. This period also saw further secularization of French society as churches and monasteries were closed and

de-Christianization had began. A new calendar was adopted to reflect the ideals of the Revolution, while a civil religion dedicated to the Supreme Being sought to replace traditional beliefs.

By early 1794 these harsh methods seemingly had paid off, as the military situation improved. The Revolutionary armies drove the Austrian-Prussian armies away from French borders and invaded neighboring Belgium, Netherlands, and German principalities. They also suppressed Federalist uprisings inside France, with the representatives on mission employing ferocious methods to eliminate the enemies of the Revolution. At Nantes, Jean Baptiste Carrier had hundreds of prisoners chained in barges that were sunk in the Loire River, while in Lyons, Collot d'Herbois and Joseph Fouché had prisoners tied to stakes in open fields and mowed them with canister. As the situation stabilized, some revolutionaries suggested that the Terror should end, which caused the Montagnards to split into factions, with Robespierre and his allies advocating a radical program of continued Terror, while Georges Danton and his supporters calling for moderation. In April 1794 Danton and his allies were arrested and, after a sham trial, executed. Robespierre and his supporters became more isolated and conspicuous, insisting on continuation of the Terror and the creation of a "Republic of Virtue." By June 1794 the Montagnards, never a solid bloc, disintegrated and collapsed in the coup of the 9th of Thermidor (July 27, 1794); Robespierre and his followers were executed the following day.

The Era of the Directory

On the 9th of Thermidor (July 27, 1794) members of the National Convention turned against the architect of the Reign of Terror, Maximilien Robespierre, and his followers and ordered their arrest. The next day Robespierre and 21 others were guillotined without trial, and the radical stage of the French Revolution came to an end. In 1795 the National Convention adopted a new constitution that created a bicameral legislative branch (Council of Five Hundred and Council of Ancients) and delegated the executive power to a five-member Directory. The suffrage was curtailed from the universal suffrage granted in 1793 to a limited one based on taxes paid. Many of the democratic reforms adopted in 1793 and 1794 were reversed, and efforts toward social and economic equality were abandoned. White Terror spread through the country as supporters of republicanism and the Terror were persecuted.

The Directory, in fact, became a bourgeois republic that struggled to find stability amid internal chaos and war. The government attempted to stand in the political center, opposing both royalists and radical leftists, which made it vulnerable to conspiracies. The general discontent led to several abortive uprisings in Paris, first by the radical sans-culottes in the Prairial Rising (May 20, 1795) and then by the right-wing sections on 13 Vendémiaire, Year IV (October 5, 1795). In 1796 the Conspiracy of the Equals, led by Gracchus Babeuf, sought to establish a social model closely resembling communism but was uncovered by police.

The Directory failed to solve the continuing financial crisis in France. It eliminated the revolutionary currency based on *assignats* (by then worthless) and issued new currency, but hyperinflation continued, causing widespread hardship among the populace. In 1797 the government returned to metal currency, but this did not alleviate the crisis. Civil strife made the government unable to collect regular taxation, leaving the state treasury empty. Many industries, especially silk cloth production in Lyon, were devastated.

The Directory was more successful in its foreign policy. In 1795 peace treaties were signed

with Prussia and Spain while the French armies advanced into the Rhineland and Holland. Only Austria and Britain were still fighting against France. In 1796–1797 Napoleon Bonaparte successfully campaigned in Italy, forcing Austria to sue for peace and cede the Austrian Netherlands (modern Belgium) and northern Italian regions to France. In 1798 and 1799 the French occupied Switzerland, the Papal States, and Naples, where they established sister republics modeled after the revolutionary France. In May 1798 the Directory, in order to threaten the British commercial interests in India, dispatched an expeditionary corps under General Bonaparte to Egypt.

France's aggressive foreign policy and the threat of the spread of the revolutionary ideology threatened other European powers and encouraged the formation of the Second Coalition of Austria, Russia, the Ottoman empire, and Britain in 1799. This coalition achieved great success in the spring and summer of 1799, when Russo-Austrian forces defeated the French armies and recaptured all of Italy. Domestically, France suffered from peasant uprisings in the south and ongoing insurgency in the west. The Directory itself was in turmoil, as its membership changed several times throughout the year. Some members of the Directory actively conspired against their colleagues, seeking army support to achieve their political goals. At this crucial moment, General Bonaparte returned to France in early October 1799 and organized a coup d'état on 18 Brumaire (November 9–10) that overthrew the Directory and established the consulate.

Nationalism in the Era of the French Revolution

European nationalist movements emerged between the seventeenth and twentieth centuries, a process in which the French Revolution played a key role. Previously, European identity was connected to one's region, town, family, local ruler, or even profession. After the French Revolution the nation-state became the most important common identifier among many people, effectively placing it above any other allegiance.

Growing nationalist sentiment in France can be traced to King Louis XVI's decision to call a meeting of the Estates General (consisting of the clergy, nobility, and commoners) in 1788 to enact fiscal reforms. The process of choosing candidates and preparing *cabiers* (sets of proposals to be considered by the elected delegates) caused many French men and women to consider political issues from a national rather than simply a local or class perspective. Once the Estates General met, it soon became clear that people of varied backgrounds desired broad measures to improve the social and political conditions of the country, and when the king threatened to disband the meeting, the Third Estate (the commoners) declared themselves the National Assembly and vowed not to disband before they wrote a constitution for France. They were joined by some members of the clergy and nobility, a sign of willingness to put the interests of the nation over those of particular groups.

This meeting and the revolutionary acts that followed drew heavily on Enlightenment principles of individual rights, liberty, and reason. The storming of the Bastille on July 14, 1789 in Paris was a powerful symbolic act because it signified the power shift from king to the people. Ordinary citizens joined together to defy the monarchical, hereditary, and birth-determined system in order to claim France for the people. In August 1789 the National Assembly passed the Declaration of the Rights of Man and Citizen, which stipulated that “the principle of all sovereignty resides essentially in the nation. No body or individual may exercise any authority which does not proceed directly from the nation.” This direct reference to the nation established a precedent by which the nation-state became the focus of an individual's

primary allegiance, trumping all other traditions and customs. In December the historic regional boundaries of France were abolished, and administrative departments were created in their place. Since regional customs and loyalty formed the hallmark of identity for most provincial French at that time, this was a significant step in the shift of loyalty to the greater republic.

Outside France, rulers and their aristocratic advisers feared the revolution. Austrian and Prussian monarchs were the chief opponents of the Revolution, and in August 1791 they issued the Declaration of Pilnitz, in which they stated their willingness to restore Louis XVI to his rightful authority. Tensions grew, and in April 1792 the ruling party in the National Assembly—the Girondins, considered moderate republicans—declared war. Later in the year the convention issued a decree promising assistance to all peoples seeking to oppose tyranny and recover their liberty. In such an atmosphere nationalist feelings intensified, as the revolution was threatened on many sides. By 1793 France faced a coalition made up of Austria, Prussia, Britain, Holland, and Sardinia, and monarchists within French borders seemed to be gathering strength, especially in the provinces. By 1793 the *sans culottes*—a working-class Parisians devoted to turning the revolution to the needs of the commoners—joined with more radical Jacobins, and together their agenda largely drove the revolutionary events of 1793 and 1794, often referred to as the Reign of Terror.

Their agenda included undying loyalty to the nation and its republican form of government. At the urging of the Committee of Public Safety, which served as the de facto executive branch of government, the National Assembly created mandatory military conscription laws between February and August 1793—the *Levée en Masse*—to defend the country. Every able-bodied man and woman within French borders was encouraged to participate in the struggle against the revolution's enemies. Symbols and images became essential elements in the creation of unity and national identity as well. The use of various symbols—from the formation of Jacobin clubs throughout France to the planting of liberty trees and the use of symbolic images on coins—encouraged nationalist and democratic

sentiments among the common people. Revolutionary language and publicity, symbols and gestures, and republican imagery—such as the use of the cockade, the singing of “La Marseillaise,” and the appearance of iconic male and female figures representing liberty and equality—all combined to create a political culture around which the French could congregate.

In an attempt to break with tradition, executions of people from peasants to aristocrats and from monarchists to troublesome republicans were aimed to rid France of the Old Regime and firmly establish a “Republic of Virtue,” based not on religion or heredity but on Enlightenment values of rights, reason, and liberty. Because the calendar was based on Christianity, it too was thrown out and a new one created in relation to Revolutionary events. To ensure no competition for ultimate loyalty to the nation, religion itself was then declared illegal. This more than anything else lessened the support for the Revolution in provincial France, where pockets of the population remained deeply attached to Catholicism.

The rise of Napoleon, who was elevated to the position of first consul in 1799, further strengthened and spread the idea of nationalism. In France, Napoleon further centralized the government, making Paris the undisputed hub of French cultural and political life, a move that was largely symbolic but did serve to create more uniformity and thus encourage identity with the larger nation. Germany was especially affected by the Revolutionary tide. In Germany, although many embraced the ideals set forth in the Revolution, others embraced romantic nationalism and emphasized the *Volk*, or people; ethnic and racial similarities and a connection to the land of Germany were highlighted as unifying features of German people. Across Europe, Napoleonic armies created nationalist movements in various countries as people responded to their conquests or occupations. This occurred not only in Germany but also most notably in Italy and Spain. In the case of England, the threat of Napoleon's expansionism is often credited by historians as a force in creating nationalist sentiment. Although diplomats at the Congress of Vienna following Napoleon's defeat tried to ignore these stirrings of nationalism, a

new and potent force had entered the world of nineteenth-century politics.

France under Napoleon

Life in Napoleonic France must always be seen in the context of a nation almost perpetually at war with her neighbors. With the execution of King Louis XVI and the establishment of the French Republic, the old order of Europe was determined to avenge the death of the king and restore, in their eyes, order to the continent. Thus, like all leaders, Napoleon had to balance the needs of national security and a war economy with the desire of the people to live in peace and prosperity. He managed to do this to a remarkable degree, at least in part due to the fact that, until 1814, military actions were not on French soil.

Napoleon's government was, in today's terms, a middle-class, pro-business government that sought to provide a high level of equality and a reasonable level of liberty. One reason that France had been willing to accept his rule was the dire condition of the country under Napoleon's predecessors. Napoleon's economic and financial reform brought a level of stability to France that had not been seen in decades. Financial reforms, improved tax collection, tight budget controls and an increased emphasis on improving exports helped keep inflation, and discontent, under control.

To cite one example, France went from being an importer of butter and cheese to an exporter. Exports in other areas, such as textiles, also greatly improved, and the added income gave benefited French citizens. Overall, exports

soared and imports declined, all to the good of the French public. In addition, Napoleon's establishment of the Bank of France provided an added measure of fiscal and monetary stability.

The French people also benefited from legal reforms, most notably in the establishment of a unified civil code eventually known as the *Code Napoléon*, as well as substantial educational reforms. He founded the first professional fire brigade in Paris. Transportation had languished in previous governments, and Napoleon spent millions on road improvements, including making them cooler by requiring trees to be planted alongside most of them. In addition to roads, he had canals built and harbors expanded. He ordered the first paved road in Paris and established an agency to protect rivers, lakes, and forests.

Napoleon placed special emphasis on the concept of equality for males, making it his highest priority. His famous quote on the matter, "In every soldier's knapsack is a marshal's baton," reflected his commitment to giving all male French citizens an equal opportunity to advance in society, and to serve the needs of the state. He worked to secure the rights of all elements of French society by removing the benefits of caste and privilege and granting religious freedom. People of all faiths could now practice their religion freely. Jews were no longer required to live only in certain areas, a policy he extended to all of his empire. Napoleon's belief in religious freedom led to tension with the Pope, who wanted the Catholic Church to be the nation's official religion. His promotion of Jewish liberation put him at odds with many in his government and even in his family, and he sometimes wavered under such pressure.

While Napoleon worked hard to promote equality, the same cannot be said with regard to liberty. Napoleon had little use for trade unions, which he generally suppressed. He made effective use of a secret police that kept him informed about what was happening throughout the nation; when considered necessary, it rounded up, arrested or deported those individuals whose presence was deemed dangerous. The seemingly constant state of warfare led to the imposition of conscription. This diminished Napoleon's popularity somewhat, and conscription-avoidance was common.

► NAPOLEON'S GOALS AS A RULER

There are many examples of Napoleon's thoughts on his goals as a ruler. Perhaps none of his writings better reflect those ideas than his letter to his brother Jérôme on November 15, 1807, telling him how he should govern his new kingdom of Westphalia (a part of modern-day Germany). The letter is excerpted below:

"I enclose the Constitution for your Kingdom. It embodies the conditions [of Jérôme's governance]. . . . I am concerned for the happiness of your subjects, not only as it affects your reputation and my own, but also for its influence on the whole European situation . . . your throne will never be firmly established except upon the trust and affection of the common people. . . . What German opinion impatiently demands is that men of no rank but of marked ability shall have an equal claim upon your favor and your employment, and that every trace of serfdom, or of a feudal hierarchy between the sovereign and the lowest class of

his subjects, shall be done away. The benefits of the Code Napoléon, public trial, and the introduction of juries, will be the leading features of your government. And to tell you the truth, I count more upon their effects for the extension and consolidation of your rule than upon the most resounding victories. I want your subjects to enjoy a degree of liberty, equality and prosperity hitherto unknown to the German people. . . . Be a constitutional king. Even if reason and the enlightenment of the age were not sufficient cause, it would be good policy for one in your position. And you will find that the backing of public opinion gives you great natural advantage over the absolute kings who are your neighbors."

Correspondance de Napoléon Ier; Publiée par ordre de l'empereur Napoléon III (Paris: Imprimerie Impériale, 1858–1869), xvi, 13361.

France's government was already centralized and Napoleon made it even more so. He established a system of prefects and judges, all appointed by, and accountable to, the central government. The educational curriculum was designed in Paris and required of all schools. Napoleon encouraged all boys to obtain an education and provided middle-class scholarships to that end. Girls were given less consideration, but even they made educational gains during Napoleon's rule. All of these policies tended to unite the French as never before and give them confidence and pride in their government.

Napoleon is often accused of censorship, and there is no question that he was careful to control the flow of news as best he could. The number of independent newspapers declined under Napoleon's rule and the news they were allowed to print was often controlled. He used every mechanism available to promote the official version of events, so much so that some of his official publications were held in contempt by many Frenchmen. All that said, it should be remembered that nations at war often exert tight domestic control. And, indeed, even with all of

the domestic restrictions in place, France was still a far freer nation than it had been during the old regime and at various stages of the revolution. While many royalists had fled the country, Napoleon welcomed all but the most radical of them back to France.

Part of Napoleon's effort to establish legitimacy to his government was his use of plebiscites to give the people an opportunity to either approve or disapprove his actions. Napoleon even used the plebiscite to confirm his decision to become emperor in 1804. While the people supported this move and he continued to be a popular leader, the establishment of an Imperial Court and Imperial Nobility seemed to some to be a move away from the ideals espoused during the Consulate. Without doubt, power became more centralized under the Empire, but Napoleon continued to be popular and his reforms made him a rather progressive emperor.

Moreover, writers of the day almost universally noted that conditions in France had greatly improved under Napoleon. Crime was down, trade was up; French culture thrived, as theaters opened, concerts were performed, and literature

flourished. It would all eventually come to an end, but for most of his reign, life in France under Napoleon was good.

Haitian Revolution

The Haitian Revolution (1791–1804) resulted in Haiti's independence from France and the emancipation of Haiti's slaves. It was the only successful slave revolt in history.

On the eve of the revolution, Haiti (then known as Saint-Domingue) was France's most prosperous colony in the Western Hemisphere, along with Europe's most important provider of sugar and coffee. Whites numbered about 30,000 and stood at the apex of society. They were divided between rich planters (*grands blancs*) and the urban poor, soldiers, and bureaucrats (*petits blancs*). Despite their privileged status, whites resented France's tight hold on colonial affairs and restrictions on trade. Free blacks and mulattoes (or *gens de couleur*) also numbered about 30,000. They held many coffee plantations and slaves, but they complained of widespread racial discrimination. Haiti's approximately 500,000 slaves were divided between those born in Haiti (*créoles*) and those imported from Africa (*congos* or *bossales*). These slaves, particularly those employed for strenuous field duties, lamented their lack of freedom and had revolted several times in the past, particularly in 1758 (Makandal Rebellion). Small communities of maroons lived quasi-independently in the mountainous interior.

Unrest began in 1789 with news that the French Revolution had begun. Whites capitalized on the revolution to gain greater autonomy from France, and in 1790 the Barnave Decree allowed white landowners to elect deputies to

colonial assemblies. Free men of color demonstrated to gain the rights listed in the Declaration of the Rights of Man and of the Citizen, but the colonial lobby insisted that the declaration did not apply to people of color. Vincent Ogé, a free person of color who had failed to be admitted as a representative in the French National Assembly in 1790, launched a short-lived rebellion that resulted in his execution (1791). The slaves were last to revolt. In August 1791 in a Voodoo ceremony held in Bois Caïman, Dutty Boukman, Cécile Fatiman, Jeannot, Georges Biassou, and Jean-François Papillon pledged to rise against the French. Though its details remain unclear, the event traditionally marks the beginning of the Haitian Revolution. The resulting uprising destroyed much of Haiti's northern plain before France granted full citizenship to the *gens de couleur* (April 1792), who subsequently helped French troops subdue part of the slave revolt.

➤ TOUSSAINT L'OUVERTURE

Toussaint L'Ouverture was the most prominent figure of the Haitian Revolution and the father of modern Haiti. Although born into slavery c. 1743, Toussaint de Bréda, as he was known before the revolution, was eventually granted his freedom and became a moderately successful, slave-owning planter. In 1791, a slave revolt erupted in Haiti and, after helping his family and his former master to safety, he took up arms against the French. He quickly became a ranking officer, commanding his own guerrilla army. He allied himself with Spain in the battle against French colonizers; however, sometime after France abolished slavery in 1794 he switched sides and helped France defeat his former Spanish allies. Toussaint became the leading military and political figure on the island as he expelled French agents and defeated mulatto rivals in the South. Though he did not seek outright independence from France, he established a constitutional government and named himself governor-general for life. In 1802, France launched a final campaign against the dangerously autonomous Haiti, and though the French captured Toussaint, who died of pneumonia in a French prison in April 1803, they ultimately failed to maintain control over Haiti. L'Ouverture is still revered in Haiti today.

The outbreak of a general European war in 1793 further weakened France's hold on Haiti. Spain attacked Haiti from Santo Domingo (modern-day Dominican Republic), while Britain landed troops in all major ports with the support of many planters wary of the French revolutionaries' radicalism. Facing multiple enemies, French commissioner Léger-Félicité Sonthonax decided to emancipate all of Haiti's slaves (August 1793) and to enroll his former black enemies as allies against foreign invaders. One such new ally was Toussaint Bréda L'Ouverture, a former slave coachman who had joined the rebellion and fought in Spanish ranks before joining Sonthonax. The emancipation of the slaves, ratified by the French assembly (February 1794), led to a French victory and the withdrawal of Spanish (1795) and then British troops (1798).

L'Ouverture emerged as the leading figure on the island when hostilities ceased. Eager to eliminate political rivals, he expelled French agents such as Sonthonax, Gabriel d'Hédouville, and Philippe Roume de Saint-Laurent and defeated rival mulatto general André Rigaud in the War of the South (1799). L'Ouverture then took over Spanish Santo Domingo (1800) and drafted a constitution making him governor-general for life with the right to name his successor (1801). He promoted racial reconciliation and economic recovery, but he presided over a regime that was military and autocratic. Former slaves, now nominally free, were forced to remain as farm laborers (*cultivateurs*) on plantations.

Fears that L'Ouverture was moving toward outright independence convinced First Consul Napoléon Bonaparte to send a 19,000-man expedition led by his brother-in-law, General Charles Victoire Emmanuel Leclerc. Leclerc managed to land his troops (February 1802) and deport L'Ouverture, but guerrilla warfare and a yellow fever epidemic killed most of the French soldiers, including Leclerc himself (November 1802), along with French reinforcements. United under L'Ouverture's successor Jean-Jacques Dessalines, blacks and mulattoes proved victorious, and the remnants of the French expedition, led by General Donatien de Rochambeau, left Cap Français (now Cap Haïtien) in November 1803. Dessalines officially proclaimed Haiti's independence in Gonaïves (January 1, 1804), then ordered virtually

all white Frenchmen to be killed (January–April 1804). Haiti emerged from the conflict as the first independent black republic in the world, but due to the revolution's length and violence, Haiti was economically destitute and an international pariah.

Spanish American Wars of Independence—Causes

The Spanish American Wars of Independence of the early nineteenth century had causes rooted on both sides of the Atlantic. Dissent within colonial societies increased due to dissatisfaction with various economic and political reforms initiated by Spain in the eighteenth century among influential native-born white colonists (Creoles). Additionally, the examples of the successful revolutions in British North America, France and Haiti as well as the Enlightenment rationale for these revolts further inspired Spanish American independence movements. Events in Europe provided the spark, however. Napoleon's invasion of Spain in 1808 and the removal of King Ferdinand VI of Spain in favor of his brother Joseph Bonaparte resulted in a constitutional crisis that set the stage for outbreak of wars of independence in Spanish America in 1810.

During the eighteenth century, Spain and its vast American empire were ruled by Spanish Bourbon monarchs after Philip V, the grandson

of Louis XIV, was installed as king of Spain by the Treaty of Utrecht after the War of the Spanish Succession (1701–1714). The Bourbons pursued a comprehensive program of political reform aimed at improving efficiency of colonial governance. A succession of Bourbon kings sought to tie the colonies closer to the mother country, enhance defenses against foreign rivals, tighten their mercantilist control of the economy, and trim the influence of the Church, which had grown wealthy and powerful. As a result of these policies, colonists at the lower end of the social hierarchy were at risk for deployment in newly expanded militia forces, while wealthy Creoles were locked out of key political positions in favor of European-born *peninsulares*. Other sectors of colonial society also had grievances: native peoples continued to suffer under systems of forced labor, while mestizos and other people of color were prevented from obtaining positions in the state and Church, and suffered considerable legal and social discrimination. Many Spanish Americans were also disturbed by the decision of the government to expel the Jesuit religious order from the Americas in 1767, a move that offended their conservative religious views and deprived the colonies of some of their best educators.

Despite growing tensions between the Spanish monarchy and its colonial subjects, increasing dissatisfaction among Creoles, the spread of Enlightenment ideas, and the inspiration of the American and French revolutions, as late as the early 1800s, the independence movement was still in its infancy. Events in Europe were soon to alter the situation dramatically. Political turmoil increased in Spanish society in the last years of the eighteenth century. King Charles IV was threatened with deposition by his son Ferdinand, and with the Napoleonic invasion of Madrid in 1808, agreed to step down in his son's favor. Napoleon, in his zeal to expand his empire, took the opportunity to remove both father and son from power and make his own brother Joseph Bonaparte king of Spain. In the six years that followed, Spaniards and colonists participated in several experiments in self-rule, establishing local *juntas* as shadow governments as guerrilla warfare continued against the French occupation. In Spain, partisans opposing

French rule organized an interim Spanish government under the direction of the Supreme Central Junta, which organized the gathering of a Cortes, or national parliament, which met between 1810 and 1814 in the coastal city of Cádiz under the protection of English naval guns. In 1812 the Cortes produced a constitution that provided for a limited monarchy and freedom of speech and of the press, but made few concessions to the Spanish American colonies.

As these events unfolded, pro-independence American leaders saw an opportunity to move toward their goal. In the spring of 1810, anticipating the fall of Cádiz to the French, in the name of the imprisoned Ferdinand VII, they organized popular demonstrations in Montevideo, Caracas, Quito, La Paz, Buenos Aires, and Santiago that forced Spanish officials to cede their authority to local juntas. These moves were resisted by groups loyal to Spain, and fighting between patriots and loyalists began even before Ferdinand VII was restored to the throne in 1813 and promptly rejected the reforms approved by the Cádiz parliament during his imprisonment. He also dispatched Spanish troops to the Americas, to put down the anti-Spanish rebellions. His efforts failed, however and after a decade of war, Spain's American colonies from Mexico in the north to Chile and Argentina in the south were independent.

The Independence of Brazil

The achievement of Brazilian independence from Portugal resembled independence movements in other parts of South America in that it was rooted in growing discontent with colonial rule in the late 1700s among landowners and urban professionals. Both groups resented higher

➤ JOSÉ BONIFÁCIO DE ANDRADE E SILVA (1763-1838)

A native Brazilian, José Bonifácio was the first minister to Pedro during 1821-1823. Bonifácio was instrumental in convincing Pedro to stay in Brazil and also pushed for a peaceful independence. In 1821 Bonifácio wrote “Lembranças e Apontamentos do Governo Provisorio de São Paulo” (Records of the Provisional Government of São Paulo), which laid the foundation for the modern Brazilian state and encouraged the emancipation of slaves. He also was pivotal in the establishment of a constitutional monarchy in Brazil, resulting in Brazil’s first constitution in 1824. However, the original men who had supported José Bonifácio began to turn against him by 1823 because of his attempts to end slavery and because of other land reform policies that hurt the Brazilian landed elite. This caused him to side with the radical liberals; however, their policies were something he could not

support long term, which caused a very uncomfortable political situation for the minister. He attempted to resign once but was dissuaded by Pedro. Bonifácio succeeded in his second attempt but was recalled by the emperor and finally was able to resign on July 15, 1823. However, although Bonifácio had resigned as first minister, he retained his position in the National Convention (the Brazilian parliament). A dispute over the emperor’s veto rights resulted in the arrest of Bonifácio and other Convention members in November 1823, and Bonifácio left for France in 1824. He returned in 1829 to become tutor to the five-year-old Pedro II after the abdication of the boy’s father. Despite his political troubles and controversial ideas, José Bonifácio will always be known as the architect of Brazilian independence and nationalism.

—*Monique Vallance*

taxes, Portuguese control of the economy, and widespread corruption among colonial officials. Brazilian independence was unique, however, in that it was achieved quickly with little bloodshed and ironically was facilitated by the Portuguese monarchy itself.

In January 1808, Prince Regent João of Portugal (ruling for his mentally unstable mother, Maria I) and the entire Portuguese court fled from Lisbon to Rio de Janeiro under the protection of the British Royal Navy. Napoleon had invaded Portugal, and João was seeking to avoid the fate of Carlos IV of Spain, whose government was being pressured by Napoleon. The king’s enemies were looking for Napoleon’s support in gaining Carlos’s abdication, which eventually was achieved. This resulted in the abdication and imprisonment of both Carlos IV and his son Fernando VII. Napoleon then installed his brother Joseph as king of Spain.

With the arrival of the Portuguese court, Brazil flourished economically and intellectually, as Joao opened the ports to free trade (a move that mainly benefited British merchants), introduced universities and newspapers, and founded a national museum and a national library. Although Napoleon was defeated in 1814, João chose to remain in Brazil rather than face

political uncertainties in Portugal, which since 1808 had been ruled by an English-controlled regency. In response to demands from some of his Portuguese subjects and diplomats at the Congress of Vienna to return to rule his kingdom from Europe rather than Rio de Janeiro, Joao ended Brazil’s colonial status and made it an integral part of the kingdom of Portugal in 1815.

In 1820, liberal constitutionalists overthrew the British regency in Portugal. After establishing a constitutional monarchy with a parliament, or Cortes, they renewed their demands that João return to Europe. João returned in 1821 but left his eldest son Pedro as regent in Brazil with a cabinet consisting of secretaries of the interior, foreign affairs, finance, war, and the navy. The Portuguese Cortes, whose 181 delegates included 65 from Brazil, passed a series of laws in 1821 designed to return Brazil to its former colonial status, especially in regard to economic matters. Then in January 1822 it demanded that Pedro return to further his education. Pedro refused to leave and announced, “Eu fico!” (“I will stay!”). He ordered all Portuguese troops to leave Brazil, declaring them enemies. On September 7, he received notice that the Cortes had declared his government traitorous and once again demanded his return. Pedro

threw his sword into the ground on the banks of the Ipiranga River, declaring, "Independence or death!" He was declared emperor on October 12 and was crowned Pedro I on December 1.

Although Portuguese troops offered some resistance to the new regime, they were defeated in 1824 by a mercenary army hired by Pedro and led by an Englishman, Lord Admiral Thomas Cochrane. The United States recognized Brazil that same year, but other countries refrained, waiting to see what Portugal would do. Great Britain was instrumental in negotiating the terms of peace between Portugal and Brazil, which was finally settled in a treaty, signed on August 29, 1825, that recognized Brazil as an independent empire. Joao VI was recognized as coemperor

until his death, and Brazil was required to pay Portugal £2 million. Britain was also granted a preferential 15 percent tariff on imported goods as well as an agreement to eventually end the slave trade as payment for its role in the negotiations.

■ Introduction: African Politics before the Scramble

For at least a century before the late nineteenth century, when the "scramble for Africa" turned the world's second-largest continent into a vast European colony, Africa was experiencing major political changes. To generalize about these changes is difficult. Precolonial Africa consisted, as it had for centuries, of many hundreds of kingdoms, empires, city-states, chiefdoms, sultanates, and confederations in addition to regions with no formal states. Clearly, however, Africa from the mid-eighteenth century onward experienced a period of political instability and flux caused by new forces that varied in substance, intensity, and location. These changes had the potential to point Africa down new paths of political and economic development. Where they might have led is anyone's guess, for in the late 1800s it was determined that European imperialism, not indigenous African developments, would decide much of the continent's future.

Many forces contributed to the political changes in Africa on the eve of the colonial era. In some cases change occurred because of the sudden demise of a major state, which then had a ripple effect in a larger region. Such was the case in West Africa, where the wealthy and militarily powerful Oyo empire (in present-day

southwestern Nigeria and Benin) collapsed in the early 1800s as a result of a succession dispute. This set off a series of wars, shifting political arrangements, and the emergence of Dahomey as a formidable regional power.

In the Sudan, the large region stretching across north-central Africa south of the Sahara and Libyan deserts, resurgent Islam reshaped politics. After the collapse of the Muslim Songhai empire in the late sixteenth century, the region had broken up into numerous small, unstable regional states, ruled in many cases by pagan or nominally Muslim kings. Beginning in the early eighteenth century the status quo was challenged by Islamic scholars and teachers whose calls to establish strict Islamist theocracies gained support among ethnic Fulani and their leaders. The result was a series of jihads, or holy wars, that began in western Sudan in the 1700s and spread eastward over the next century. The most famous was the Sokoto jihad, which was launched in 1795 by the Fulani leader Usman dan Fodio and led to the formation of the Sokoto caliphate in Hausaland. Other jihads continued in the nineteenth century, resulting in a string of Islamic states across northern and central Sudan.

In southern Africa, population pressure was a major catalyst for political change. Conflict over grazing land among the pastoral peoples of the region intensified in the late eighteenth and early nineteenth centuries as a result of overpopulation caused by migration and rising birthrates. Drought, the introduction of slave trading in the region, and northward migrations of Dutch settlers added to tensions. The result was the rise of a powerful Zulu kingdom under the leadership of Shaka, whose large and disciplined armies spread terror through the region, setting off a series of northward migrations by his defeated rivals. The Zulu kingdom ceased to exist as an independent state in 1879, but not before its conquests had caused a series of wars and political changes not only in southern Africa but also in regions that stretched 1,000 miles (1,600 kilometers) northward, to the Great Lakes region in present-day Tanzania.

The fate of the Zulu empire, which lost its independence after a military defeat by the British, is an example of how contact with outside forces, mainly but not exclusively from Europe, affected Africa's political landscape. Every part of Africa was affected by such pressures. In the northeast, Napoleon's short-lived invasion of Egypt between 1798 and 1801 set the stage for the rise to power in Egypt of the Albanian adventurer Muhammad Ali, whose armies conquered Sudan (the political entity south of Egypt, not the region) in 1821 in pursuit of slaves, gold, and prestige. Along Africa's eastern coast, increased Arab involvement in the slave and ivory trade led to the formation of a commercial empire under the control of the Omani Arab leader Seyyid Said, who in 1840 moved his capital from Muscat, on the southwest corner of the Arab Peninsula, to the island of Zanzibar, off Africa's coast. Arab commercial activities also affected the interior, where competition to supply coastal merchants with ivory and slaves led to slave raids, political disintegration, and warfare, made worse by the proliferation of firearms.

Paradoxically, on Africa's west coast where the slave trade declined after Great Britain, the United States, and other European nations outlawed it, the actions of abolitionists contributed to political change. English abolitionists in 1787 founded the colony of Sierra Leone as a homeland for repatriated slaves, and it became a

Crown colony in 1808 after the original organizers and an English trading company abandoned the enterprise. A similar undertaking, in this case for freed American slaves, was sponsored by the American Colonization Society. This resulted in the founding of the state of Liberia, which though not an American colony, received diplomatic support from the U.S. government and benefited from American philanthropy.

European political involvement was most extensive in southern Africa, where the Dutch East India Company established a settlement at Cape Town in 1652. By the late eighteenth century the region had attracted several thousand permanent Dutch settlers, some of whom had left the coast to become *trekboers*, or frontier farmers, in the interior, where they clashed with native peoples over grazing lands. Tensions in the region grew in the early nineteenth century after the British took control of Cape Colony from the Dutch and adopted a series of policies, especially the outlawing of slavery in 1834, which the Boers found deeply disturbing. To escape British authority and acquire new land for their expanding population, in the 1830s the Boers embarked on the Great Trek, a migration to the east and northeast that led to further conflicts with native peoples, clashes with the British, and the formation of three Boer states: Natalia, Transvaal, and the Orange Free State. The victims in these entangled events were the African people, who were driven off their land or reduced to the status of squatters, tenant farmers, or laborers on land owned by whites. As was true for Africa as a whole, however, these events were only a foretaste of the losses encountered after the European onslaught began in earnest in the closing decades of the century.

—James H. Overfield

The Formation of the Sokoto Caliphate

The Sokoto caliphate emerged as an Islamic society during the early nineteenth century in Hausaland, located in present-day Nigeria. The caliphate was formed following an Islamic revolt led by Shaikh Usman dan Fodio (1754–1817). Usman dan Fodio was an ethnic Fulani and was raised in the hamlet of Degal as a Sufi Muslim. Prior to his jihad, he openly accused leaders in

Gobir, the capital of Hausaland, of being sinful infidels who used perverted interpretations of Islamic law to advance and validate corrupt governmental practices. Dan Fodio drew disciples from throughout Hausaland due to his education, charisma, and recognized piety. By 1804, tensions had intensified between the government of Gobir and dan Fodio and his community of followers. The Usmanian community formally banded together, migrated to a secluded countryside, and declared war against Gobir.

Shaikh Usman dan Fodio's eventual victory against the government of Gobir did not come easily. His army was primarily made up of older Islamic scholars, with limited to no experience in combat. While overall the government's army had better-trained soldiers than did dan Fodio, he had several commanders who were more competent than the government's military leaders. Dan Fodio's diligent preaching and leadership throughout the jihad also played a critical role in his victory. During the revolution, dan Fodio corresponded with multiple leaders in Islamic communities throughout Hausaland, urging them to support the jihad. Shaikh Usman dan Fodio was able to increase the size of his army through these invitations. The jihad also extended throughout Hausaland, with a focus on conquering Gobir. After four and a half years and a series of battles, Gobir was annexed and its government was overthrown. The area was rebuilt and renamed Sokoto.

Sokoto became the capital of dan Fodio's caliphate, and dan Fodio became the first caliph. Sokoto was established as an Islamic society, modeled after the teachings of the Quran and Sunna, and became the largest polity in West Africa at the time. The caliphate claimed power over Hausaland and also expanded westward and southward. Crossing between the eventual western and eastern ends of the kingdom took nearly four months, and it was a two-month journey to travel from the north to the south. Because of its vast size, responsibilities and leadership within the Sokoto caliphate was shared. Dan Fodio divided the caliphate between his second son, Muhammad Bello, and his brother, Abdullahi. These men also appointed additional local leaders, who were given instructions on proper Islamic conduct along with emirates to control. Sokoto was highly regarded both for its military strength and

also Islamic scholarship. Even as caliph, dan Fodio continued to compose celebrated poetry and wrote a variety of Islamic texts on government, history, and Quranic exegesis.

Muhammad Bello worked closely with his father in founding the caliphate and succeeded him following dan Fodio's death in 1817. Bello was able to assume the office of caliph without any violence or rebellion. However, revolts against Sokoto arose soon after Bello's appointment. Bello studied the history of Arab conquests and, by imitating others' tactics, was able to suppress rebellions, further expand the caliphate, and consolidate his power. Bello was admired for his patience, intellect, and statesmanship. His strong political and religious leadership ensured the continuation of the Sokoto caliphate. Upon Bello's death in 1837 his full brother, Abu Bakr Atiku, took his position. Male descendants of dan Fodio continued to rule Sokoto until its fall in the early twentieth century.

Political Developments in East Africa, 1750–1880

Between 1750 and 1880 political developments in East Africa, from the western shores of the Indian Ocean to the western arm of the Rift Valley, between Kilwa in the north and the Zambezi River to the south brought about greater regional unity through responses to new opportunities for participation in global trade networks. After 1750 the involvement of foreign traders transformed the scale and organization of coastal and interior relations. A century later, the Swahili coast, while firmly part of the western Indian Ocean rim, also had developed ties with the African interior through empire building, migration, and the intensification of long-distance trade.

Foreign trade with East Africa played a significant role in this century of changing political landscapes. In the 1770s French sugar and coffee

► EYEWITNESS ACCOUNT OF THE SWAHILI OF ZANZIBAR

As described by the British traveler Richard Burton, the ethnic diversity of Zanzibar in the 1840s was dazzling. Historically the cultural mixing on the East African coast was a consequence of its geographic location on the rim of the Indian Ocean and the array of commercial opportunities that this location afforded. The Swahili language (kiSwahili) was born sometime around the first millennium CE. It was an amalgam of Bantu linguistic structure and vocabularies borrowed from a large number of trading partners, including Persian, Arabian, and South Asian. Apart from a few Arab documents, prior to the nineteenth century there were almost no written descriptions of the participants in the process of becoming Swahili. In the nineteenth century the moving frontier of Swahili speakers once again included South Asians, Arabs, and local East African-born migrants. Their island and inland success was observed by foreign merchants and travelers, including Burton.

According to Burton, there were several different groups of Arabs and Baluchis and a variety of South Asian religious and ethnic groups in Zanzibar, a bustling island city-state. Burton observed that some “Indians” reportedly spoke Swahili as their first language, suggesting that in the cultural crucible of East Africa they were immigrants and not visitors. Over time the adoption of the Swahili language, Islam, and a cosmopolitan urban life helped to meld together the disparate elements of the region, allowing political consolidation to make headway even in remote towns in the interior.

—*Candice Goucher and V. Keven Shipman*

plantations in the western Indian Ocean created a heightened demand for slave labor. In particular, the activities of Arab, Swahili, and Yao slave traders drew larger numbers of enslaved Africans from the interior to the East African coastal markets. By the early nineteenth century Omani commercial and political interests had spread to the East African coast. Under the Omanis, Kilwa was rebuilt and became a major port for slaves and ivory.

Before 1800 the interior states had controlled most of the trade to the East African coast. In

the 1820s the Omani sultan and ruler of Muscat Seyyid Said (1790–1856) established clove plantations on the islands of Pemba and Zanzibar. When he eventually moved his capital to Zanzibar in 1838, Seyyid Said consolidated political power, albeit in the shadow of the British Empire. Accompanying Seyyid Said to Zanzibar was the British agent for the East India Company, Atkins Hamilton, himself a sign of expanding British imperial interests in East Africa. American and other merchants soon followed. Increasing numbers of Swahili merchants of local coastal, Arab, and South Asian extraction also began to lead their own trading caravans into the interior. By 1863 ivory exports from Zanzibar were more than 300 tons, and 70,000 slaves were exported annually; by the mid-nineteenth century urban centers in the interior were brimming with new migrants from the coast.

During this period of dramatic economic transformation, the region's political systems increasingly were based on the ability of ruling elites to manipulate the participation of their subjects in long-distance trade in slaves, ivory, copper, guns, iron, gold, and foodstuffs. Political reputations were based partly on the achievement of material wealth and influence accrued during caravan travels. Even as the trade in enslaved Africans declined, slave labor was utilized by the caravans in the form of porters and by elites in expanding agricultural production. The persistence of slavery in East Africa gave European colonists later in the century an excuse to intervene in the region.

The possibilities of trade created new regional dynamics that sometimes bypassed coastal connections but never fully avoided them. The nineteenth-century rise of Buganda in the interlake region did not resemble the earlier kingdom of Bunyoro, a village-based confederation that relied on tribute from raiding. In contrast, Buganda was highly centralized and heavily engaged in the slave trade with the north, attracting the attention of North African Muslims and European Protestant missionaries in the 1860s. To the south, farmers were increasingly dominated by Tutsi pastoralists, leading to two major kingdoms in the mid-eighteenth century, Rwanda and Burundi. Eventually even clan-based chiefdoms coalesced into larger states

that increasingly relied on long-distance trade in iron, salt, slaves, and ivory to cement their control over the region's political economy. In the long term, East African political independence would give way to the imperialist desires born of the capitalist era.

Political Developments in Central Africa, 1750–1880

Important political changes took place in Central Africa during the volatile period between 1750 and 1880. Politics in the region, which straddles the equator between the North Atlantic coast and the Great Lakes region, were dominated by violence, greed, and increased foreign interventions, as the transatlantic slave trade became a driving force behind political developments. The

region's role in the Atlantic slave trade brought about the most dramatic changes in political power. Enslaved Central Africans were primarily shipped to Brazil as a result of the Portuguese presence in Angola. Although Britain declared the abolition of the slave trade in 1807, Portugal continued the coastal Atlantic slave trade for another 30 years. Thereafter the slave trade underwent important changes, shifting from European interest and involvement to an increased control by Arab-Swahili traders.

The access to weapons, gained through the trading of slaves, brought about changes in the region's political structures. This resulted in political instability for many fragmented kingdoms that were forced to align and realign as the political landscape changed. Swahili and Portuguese Creole merchants were also penetrating the easternmost parts of central Africa. Trade caravans carrying slaves and ivory attracted migrants from the East African coast and encouraged the growth of towns in the regions of the upper Congo and Zambezi. These creolized societies became competition to inland kingdoms as they started to control trade routes. For example, the Luba kingdom, in the marshy grasslands of the Upemba depression, asserted political power by conquering smaller states as it expanded eastward toward Lake Tanganyika in the late eighteenth century. The growing pressure of Arab-Swahili traders brought on the decline

► THE PORTUGUESE QUEST FOR A TRANSCONTINENTAL AFRICAN EMPIRE

In the late eighteenth and early nineteenth centuries the Portuguese sought to connect their territories in Angola on the South Atlantic Ocean with those in East Africa on the western rim of the Indian Ocean. By 1760 Mwata Kazembe III Lukwesa Ilunga had emerged as a powerful leader in the interior between these two oceans. He secured his political control by demanding submission of the region's competing kingdoms in exchange for security. Ironically his brief but successful reduction in conflict allowed the Portuguese administrator, Dr. Francisco José Maria de Lacerda, who was exploring the region, to reach the interior capital of Kazembe in 1798. Although Lacerda died awaiting an audience with Mwata, his chaplain returned

with Lacerda's notebooks, among the earliest documentary evidence of Kazembe.

The subsequent attempts to claim the site that Lacerda had documented ignored African sovereignty. The site on the Matizi stream was eventually purchased as Portuguese territory from a neighboring chief and became an early, if isolated, colony. The trade route through the interior that would have created transcontinental connections across Central Africa was never realized by the Portuguese. Aside from the brief occupation of the military garrison (1837) and a feeble attempt to grow manioc, Lacerda's imperial dream proved to be not only deadly but elusive.

—Candice Goucher

of the Luba in the latter part of the nineteenth century. Arab-Swahili access to guns also threatened the northern trade of the Luba.

The stability of other Central African states was equally dependent on external trade. The Kuba kingdom developed east of where the Kasai and Sankuru rivers join, northeast of their Luba trading partners. Long-distance trade routes had been established during the seventeenth century in connection with European slave traders who introduced new crops such as maize from the Americas. Their trade networks reached the Atlantic coast and linked them closely with the forest and savanna peoples of the north and south such as the Lele. Living near rivers with good soil, the Kuba flourished as they gained a rapid population growth that secured the success of their political structure, which protected trade routes for more than two centuries. However, the uncompromising presence of Arab and European slave traders eventually challenged the political power of the Kuba kingdom. This foreign pressure primarily contributed to the decline of the Kuba in the late nineteenth century.

The emergence and growth of the Lunda Empire, to the south of the Luba, was an important factor in maintaining the political balance in West Central Africa at the beginning of the nineteenth century. The slave trade caused the Lunda to become one of the major suppliers of slaves. By the mid-nineteenth century the seminomadic Chokwe peoples, to the south,

absorbed power with the Lunda. The Chokwe arose as a new political power, becoming strong trade rivals specializing in ivory, honey, and wax. Their focus on such goods expanded their trade and influence. They were very skilled hunters and blacksmiths with a reputation for attacking slave caravans. The Chokwe repeatedly intervened in Lunda succession disputes, allowing them to expand farther north and assimilate Lunda. As more local peoples became prey to aggressive slave trading by groups such as the Chokwe, indigenous societies began to use slaves more intensely than ever before. For example, men began taking slave wives. Women, who were displaced by kidnapping and subsequent enslavement, were eventually integrated into other societies, often as a result of Chokwe raiding parties. Their experiences furthered the processes of cultural integration and constant political realignment that characterized the era.

■ Introduction: Political Developments in Europe, 1815–1914

Having experienced 25 years of war and revolution, the monarchs and diplomats who attended the Congress of Vienna in 1814–1815 following the defeat of Napoleon did their best to reestablish the old political order that had existed before 1789. They restored royal dynasties to their “rightful” thrones in Naples, Spain, France, Piedmont-Sardinia, and the Netherlands and redrew national boundaries in ways that gave precedence to the balance of power, not the aspirations of emerging nationalist movements. The

efforts of the French king Charles X to restore the privileges of the nobility in the 1820s, the suppression of nationalist clubs in Germany in 1819, the English Parliament’s eagerness to approve censorship legislation in 1819, and the success of Tsar Alexander II in persuading Prussia and Austria to join a holy alliance to protect throne and altar all were signs that conservatism was ascendant. It was a brief and fleeting ascendancy, however, and in the century that followed the transformation of European politics continued.

This transformation continued, first of all, because of the social changes brought about by urbanization and industrialization. The middle class grew in numbers and wealth; a large class of factory workers emerged, the number of farmers and rural workers declined; and wealthy landowners, who had lost many of their privileges during the era of the French Revolution, faced economic challenges after serfdom ended in central and eastern Europe and agricultural prices plummeted in the late 1800s. The spread of literacy, the proliferation of daily newspapers, and the formation of political parties ensured that Europeans could follow political developments and form political opinions at levels unknown in previous eras. Finally, despite efforts of conservative politicians, the events and ideals of the French Revolution—its commitment to equality, freedom, popular sovereignty, and democracy—continued to be the standard by which individuals judged governments. It also was an inspiration for further change.

A unique feature of political life in the nineteenth century is the emergence of ideologies: integrated bodies of sociopolitical doctrines, assumptions, and aims that are espoused in competition with other ideologies. Between the 1810s and the 1840s all of the following words, each representing a different ideology, appeared in the English language: liberalism, radicalism, socialism, republicanism, conservatism, monarchism, nationalism, and communism. The ideas behind many of these ideologies were not necessarily new. Most can be traced back to the era of the Enlightenment and French Revolution and in some cases even earlier. Reverence for tradition and stability, for example, existed long before “conservatism” entered the English language in 1835.

Every one of the ideologies that emerged in the early 1800s changed over time. Liberals, mainly drawn from the ranks of the middle class, maintained their commitment to free trade, parliamentary government, and the protection of basic freedoms throughout the period but by the end of the century had become more willing to use government to solve social issues and more comfortable with extending the right to vote to workers and women. Socialism was at first represented by a range of individuals who were appalled by the injustices and inequalities

of emerging industrial societies and envisioned alternative societies based on cooperation, harmony, and the communal ownership of property. After Karl Marx, who dismissed these early socialists as “utopian,” socialism gathered millions of followers, mainly drawn from the working class and intellectuals, who joined organizations and political parties committed to the destruction of capitalism, either by revolution or the ballot box. Nationalism was at first identified with intellectuals, young people, and idealists who allied themselves with liberalism and republicanism and committed themselves to the principle of national self-determinations for all peoples. After the failure of the liberal/nationalist revolutions of 1848, nationalism increasingly came to be identified with pragmatic and conservative politicians and causes such as economic protectionism and higher military budgets.

Although liberalism, socialism, nationalism, and conservatism were part of the political vocabulary of every European state, as the following group of entries shows, the political histories of individual states and regions varied considerably between 1815 and 1914. Great Britain remained a constitutional monarchy but one in which acts of Parliament in 1832, 1867, and 1884 extended the right to vote to virtually all adult males. France after the Congress of Vienna also was a constitutional monarchy but after experiencing revolutions in 1830, 1848, and 1870–1871, it ended the century as a republic deeply divided among radicals, socialists, republicans, liberals, conservatives, and monarchists. For Germany and Italy the major development was national unification, achieved in Italy after Rome and the surrounding territory were annexed by the Kingdom of Italy and in Germany at the conclusion of the Franco-Prussian War. Farther east, Russia remained an autocracy but one capable of undertaking major reforms such as the freeing of the serfs in 1861 and 1886. It too received a constitution and parliament after the Revolution of 1905.

By the early twentieth century the forces of liberal democracy were ascendant. Most European states were still monarchies, but with few exceptions they were monarchies with constitutions, parliaments, free speech, and a free press. Although not without enemies on the Left and

the Right, democracy and constitutionalism seemed to have a bright future. As in so many other areas of European life and thought, these political expectations were shattered by the slaughter of World War I and its aftermath.

—James H. Overfield

The Decembrist Revolt, 1825

The Decembrist Revolt was an abortive rebellion centered in St. Petersburg and southern Russia and led by liberal members of the Russian army officer corps in December 1825. Its goals were to prevent Nicholas, the younger brother of the recently deceased Tsar Alexander I, from assuming the throne and to implement a program of constitutional and social reform. The rebellions were easily suppressed by forces loyal to Nicholas and thus set the stage for three decades of reactionary and oppressive rule by Nicholas I (r. 1825–1855).

During the Napoleonic Wars, many Russian officers while campaigning in Western Europe were exposed to new liberal political ideas growing out of the Age of Enlightenment and the French Revolution, including constitutionalism, representative government, and freedoms of speech and the press. Some entertained even more radical ideas, including an end to Russian serfdom. After the defeat of Napoleon these officers returned to a Russia ruled by Alexander I (r. 1801–1825), who by then had lost most of his earlier enthusiasm for liberal reform and had delegated much of his authority to the archconservative General Aleksey Arakcheyev (1769–1834). Arakcheyev was especially unpopular within the army for his role in establishing the so-called military-agricultural colonies, settlements of army veterans and local serfs who lived under harsh discipline and combined agriculture and service in the army reserve.

In this oppressive and reactionary atmosphere, liberal-minded army officers played a key role in the formation of secret societies. These included the Union of Salvation, founded in 1816 in St. Petersburg by an idealist young officer, Pavel Pestel; the Union of Welfare, founded in 1818 after Pestel left St. Petersburg and temporarily disbanded in 1821; the Southern Society, founded in 1821 by Pestel in Tulchin, a city in the southwestern Ukraine; and the Northern

Society (1822), a reincarnation of the Union of Welfare. The two latter societies played the key role in the events that unfolded in December 1825. The Northern Society advocated a rather conservative constitutional monarchy, while the Southern Society under Pestel favored a centralized Russian republic, which Pestel had outlined in his treatise *Russian Truth* (*Russkaya Pravda*). The Southern Society developed a rigid organization and established contacts with other revolutionary groups including the Society of the United Slavs, which sought to establish a democratic federation of all Slavic peoples. Pestel's effort in 1822 to merge the Northern and Southern Societies failed when the more moderate northern group refused to endorse his republican agenda.

The disappointment among members of these societies with the course of Alexander I's reign was revealed upon his unexpected death on December 1, 1825. Normally, Alexander's eldest brother Grand Duke Constantine, who commanded Russian troops in Poland, would have succeeded the childless Alexander I. However, a few years earlier, Constantine had married a Polish noblewoman of lower status and secretly renounced his rights to the throne. In 1822, Alexander formalized this arrangement in a manifesto, which confirmed his youngest brother, Nicholas, as successor to the throne. However, the manifesto remained unpublished, and very few people at the court knew about it. On Alexander's death, Constantine, who had no desire to reign, swore allegiance to Nicholas, but Nicholas refused to announce his accession to the throne until Constantine traveled to St. Petersburg and officially announced his abdication. Constantine refused, and in the confusing situation that followed, support for Constantine grew among Russians who were committed to upholding the laws of succession or opposed Nicholas because of his reactionary views. The succession crisis ended only on December 25, when Constantine publicly reaffirmed his position and assumed the title of the emperor.

The Northern Society, taking advantage of this brief but confusing interregnum, staged an uprising in St. Petersburg on December 26, when the conspiring officers convinced soldiers to refuse to take a loyalty oath to Nicholas and

defend the rightful interests of Constantine. The rebel leaders wanted to enter the Governing Senate, the highest legislative, judicial, and executive body in the empire, and demand the publication of an edict that would abolish serfdom, grant freedom of speech, and establish an assembly that would in turn adopt a constitution. Some 3,000 soldiers filled the Senate Square in the heart of the capital. The government was caught unprepared, but General Mikhail Miloradovich, the governor of St. Petersburg, quickly mobilized the remaining forces that surrounded the mutineers.

Both sides showed hesitation. The Decembrists suffered from incompetent and indecisive leaders and general confusion among their ranks, while Nicholas I was reluctant to start his reign with a massacre. Acting on his own, Miloradovich, a decorated general of the Napoleonic Wars, personally rode to the rebel troops hoping to use his stature to talk them into submission, but he was shot dead by Petr Kakhovsky, an officer and member of the Northern Society. Finally, by the end of the day after Nicholas approved the use of force to end the uprising, government troops opened fire, killing about 60 people and wounding dozens. The capital was placed under martial law, and large-scale arrests followed.

Meanwhile, the Southern Society, based in Tulchin, suffered a serious blow when the police arrested their leaders, including Pestel and Sergey Muravyev-Apostol. As the news of events in St. Petersburg arrived on December 27–28, the members of the Southern Society decided to act by using force to free some of the arrested leaders. The rebel Chernigov Regiment, led by Muravyev-Apostol, staged an uprising on December 29 but was quickly disarmed by government troops. All rebel leaders, both in St. Petersburg and Tulchin, were arrested. An extensive investigation, in which Nicholas I personally participated, resulted in the trial of 289 Decembrists. Five of them, including Pestel and Muravyev-Apostol, were executed. Thirty-one were imprisoned, while the rest were banished to Siberia.

Nicholas was deeply affected by the Decembrist uprising, which made him suspicious of even mildly liberal ideas and set him against any major political change in Russia. Instead, Nicholas tried to rely on as few advisors and officials

as possible and developed a new administration that focused all decision making on the tsar himself. This created a cumbersome system that became increasingly repressive after a wave of liberal revolutions in Europe in 1830 and 1848. In turn, this delayed the introduction of much-needed reforms to transform the social and political structure of the Russian empire.

The Revolutions of 1830

The failure of European statesmen to reinstitute a conservative political order in Europe was fully revealed in 1830, when a wave of revolutions and revolts swept across much of Europe. Although revolutionaries succeeded in achieving their goals in France and Belgium only, the fact that insurrections also occurred in Poland, Italy, Spain, and Germany shows that liberalism and nationalism had broad ongoing support.

In France the restored Bourbon monarchy of Charles X was by 1830 deeply disliked by liberals for the king's attempts to install an ultraroyalist government and set aside the charter granted by his predecessor, Louis XVIII, in 1814. In July 1830, Charles X dissolved the Chamber of Deputies, disenfranchised three-quarters of the French electorate, restricted the press, and ordered new elections under the restricted franchise. While middle-class liberals wanted to protest by refusing to pay taxes, on July 27 the common people of Paris began attacking royalist symbols and clashed with the city gendarmes. The king's general, Marechal Auguste-Frédéric de Marmont, who was particularly disliked as a former Napoleonic general who had surrendered Paris to the

allies in 1814, wanted to move against the mobs immediately, but the king hesitated. This delay allowed the Parisians to block streets with barricades in strategic areas while former national guardsmen joined in the rebellion. With royalist troops increasingly demoralized, Charles X fled from Paris to Versailles and then to Rambouillet and abdicated in favor of his son, who in turn abdicated in favor of his nephew. Liberals in the Chamber of Deputies, however, supported Louis-Philippe, the Duke of Orleans, who had been appointed lieutenant-general of the realm by Charles X on July 31 and had a reputation of sympathy for liberalism. Louis-Philippe accepted the offer and, after agreeing to uphold the Charter of 1814, became “king of the French” rather than “king of France.” Charles X fled to England. During Louis-Philippe’s reign the size of the electorate was doubled, and the Catholic Church ceased to be the official state religion, but France was still far from being a republic.

In August, revolution spread to Belgium, under Dutch rule since the Congress of Vienna (1815). After riots by agricultural and industrial workers had been put down by civilian authorities in Brussels, the Dutch were not alarmed by a spontaneous uprising following a performance of the nationalistic French opera, *La Muette de Portici* (its plot centered on a revolt in Naples against Spanish rule), and delayed sending troops. When Dutch authorities did respond, a clash between Dutch troops and rebels in a Brussels park ended with 400 rebels and 750 Dutch dead, an enormous toll that led to the Dutch evacuation of the city and the establishment of a provisional French-speaking Catholic government. This government proclaimed the independent state of Belgium on July 21, 1831, that then crowned Leopold of Saxe-Coburg-Gotha its first king.

Nationalism also inspired revolution in Poland, which the Congress of Vienna had established as a kingdom with its own army but with Tsar Alexander I of Russia as king. Although Alexander granted the Poles a constitution in 1818 that provided for a parliament, it had little authority. When it expressed opposition to certain Russian policies in 1820, Alexander prohibited it from meeting for five years. Encouraged by events in France, in November 1830 Polish military cadets in Warsaw rebelled and captured the

arsenal, forcing the withdrawal of occupying Russian troops. In January, under popular pressure, the Polish parliament declared that Tsar Nicholas I was no longer the Polish king, formed a provisional government, and prepared the Polish army for an anticipated Russian attack. Although the government raised an army of 30,000, it was weakened by divisions between moderates and radicals, and without hoped-for aid from France and Great Britain, Warsaw fell to the Russians in the autumn of 1831. Under restored Russian authority, Tsar Nicholas abolished Poland’s constitution, parliament, and army.

In 1830 nationalist insurrections in Italy, directed against Austrian rule, took place in Parma, Modena, Bologna, and several cities in the Papal States but were crushed by Austrian troops and the Papal army. German revolts occurred in several Rhineland states and forced the rulers of Hesse-Kassel and Hanover to make liberal concessions. Popular uprisings also led to the granting of constitutions in Saxony and Brunswick. However, when a nationalist rally attracted 30,000 people in 1832 to the university city of Heidelberg, the diet of the German Confederation passed the Ten Articles, which called on member states to take steps against liberalism and rebellion. In Germany and elsewhere, liberalism and conservatism remained in a state of tension until 1848, Europe’s next great revolutionary year.

The Revolutions of 1848

The Revolutions of 1848 were a series of liberal-nationalist revolts in France, Italy, Germany, Austria, and Hungary as well as a number of other regions of Europe in 1848 and early 1849. Immediate causes include the famines and economic depression that had gripped Europe after 1846, years of oppression by post-Bonapartist monarchies, lingering liberal and republican

sympathies from the French Revolutions of 1789 and 1830, feelings of ethnic solidarity and nationalism, and the emerging ideologies of socialism and anarchism. Although the revolutionaries failed to achieve their goals, the revolutions had long-term ramifications for European political developments.

The first revolt occurred in Palermo, Sicily, on January 12. In late February, Parisians rose in revolt when soldiers killed 52 demonstrators outside the Ministry of Foreign Affairs, and King Louis-Philippe abdicated and fled to England. Liberals, republicans, and nationalists rebelled in several Rhineland cities on March 3, in Vienna on March 12, in Berlin on March 15, in Milan on March 18, and in Venice on March 22.

In France, after Louis-Philippe's abdication a provisional republican government, consisting mainly of moderates, established national workshops to provide work for the unemployed and arranged for elections to a constituent assembly. When the assembly decided to close the national workshops because of cost, working-class violence broke out in Paris, and the assembly gave dictatorial powers to General Louis Eugène Cavaignac to restore order. Between June 24 and 26, class warfare erupted in Paris between workers and the National Guard, ending only after 1,500 workers had been killed and between 12,000 and 15,000 were arrested. The government then issued a constitution for the Second Republic and arranged for elections. In December, Cavaignac lost the presidential election to Louis Napoleon (Napoleon I's grandson), who gradually consolidated his authority until, in 1852, he could proclaim the Second Empire, with himself as Emperor Napoleon III.

In Austria, rioting in Vienna forced the resignation of Emperor Ferdinand I's powerful state chancellor Prince Metternich on March 13. The empire seemed ready to dissolve after Ferdinand granted virtual autonomy to Bohemia and Hungary. Shortly after dissatisfied Bohemian subjects revolted in Prague on June 12, Austria and other royalist governments launched sustained counter-revolutionary attacks. By fall they were succeeding throughout Europe, most notably in Austria, where Field Marshal Alfred Windischgraetz recaptured Vienna from the revolutionaries on October 31. But Ferdinand I, who suffered from

Lithograph from 1848 shows fighting at the Barricade in front of the Kolln City Hall in the Breiten Strasse, March 18–19, 1848. (Bildarchiv Preussischer Kulturbesitz/Art Resource, NY)

severe epilepsy, was unable to reestablish civil order, recover lost Italian provinces, or subdue Hungary. He abdicated on December 2 in favor of his nephew, Franz Josef I, who reigned until 1916.

Unchecked rioting erupted in Berlin on March 18. The most powerful German prince, Prussian king Frederick William IV, after eight years of failing to pursue liberal reforms instituted by his father, Frederick William III, was compelled on March 22 to promise a constitution for a representative government. The violence continued in many German states, and in May delegates gathered in a national parliament in Frankfurt to consider a constitution for a united Germany. Politically divided and weakened after King Frederick William IV refused its offer to become king of Germany, the assembly disintegrated in the face of counterrevolution. Following the revolution's failure, large numbers of constitutionalists and liberal sympathizers fled. Many settled in the United States, where they became known as "48ers."

Nationalism was the primary fuel of revolution in Italy, where rebels of all political leanings sought to throw off Austrian, French, and papal influences to create a unified country. In March, Lombardy, Venetia, and Tuscany all expelled Austrian troops and declared republics, and the king of Piedmont-Sardinia, Charles Albert, offered troops in support. In response, Austria dispatched Field Marshal Josef Radetsky to suppress anti-Austrian uprisings in northern Italy. Radetsky defeated King Carlo Alberto of Sardinia at Custoza in July and captured Milan in early August. After the loss of Milan, Giuseppe Garibaldi waged guerrilla warfare against the Austrian presence in Italy and later commanded Italian forces when they resisted French-supported efforts to restore papal control of the Papal States. When the French took Rome in July 1849 and the republic of Venice surrendered after an Austrian siege in August, Italy's revolution was finished.

In Hungary, a province of the Habsburg empire, the Hungarian patriot Louis Kossuth made a famous speech in the Hungarian Diet on March 3, 1848, calling for Hungarian independence from Austria. In April the Diet took advantage of Austrian disorder to force Ferdinand to accept wide-ranging reforms, known as the April Laws. They established Hungarian home rule, freedom of speech, tax reforms, and the loosening of serfdom. Emboldened by Kossuth's defiance of Austria but unwilling to be part of a Hungarian republic, Serbs, Croats, Czechs, Slovaks, Romanians, and other ethnic minorities, mostly Slavs, demanded their own nations and revolted against both Hungary and Austria, thus weakening Kossuth. After the suppression of the revolt in Vienna and the abdication of Ferdinand I, the Austrian government took a harder line against the Hungarian rebels. An imperial army took Pest in early 1849, but the revolutionaries, entrenched in Debrecen, declared total independence from Austria and fought on against Austrian and Russian troops, which the tsar had dispatched in response to the Austrian emperor's appeal for intervention. The Hungarian army surrendered in August 1849, and Kossuth fled into exile.

With the Hungarian defeat, the revolutionary movements that had shaken Europe came to an end, with little to show in terms of results. In the face of counterrevolution, the revolutionaries

were plagued by political disagreements, social divisions, and a lack of military power. The revolutions' main consequence was the strengthening of conservative governments, which in the 1850s and 1860s satisfied some of the aims of the 1848 revolutionaries in terms of national unification and moderate constitutional reform but were strongly opposed to revolutionary, republican, and socialist ideals.

The Paris Commune of 1871

The French military debacle in the Franco-Prussian War (1870–1871) led to the downfall of Napoleon III and the proclamation of the Third Republic in September 1870 and then a civil war in which radical patriots in Paris under the direction of the revolutionary municipal council, or Commune, fought against the antirepublican National Assembly sitting in Versailles. The savagely fought civil war, which lasted from March to May 1871 and ended with the crushing of the Commune's supporters, revealed the deep social and political divisions within French society.

Eager to replicate Napoleon I's military triumphs and angered by the publication of secret diplomatic correspondence (Ems dispatch), French emperor Napoleon III (r. 1852–1870) began the Franco-Prussian War against a coalition of German states. The war, which featured the generalship of the talented Helmut Graf von Moltke of Prussia and the mediocre Achille Bazaine and Marie Edmé Patrice de MacMahon of France, began with the siege of Metz and the disaster of Sedan (September 1, 1870) in which Napoleon III and much of his army were captured. A proupublican Parisian crowd declared the end of the Second Empire and the creation of the Third Republic upon learning of the defeat (September 4, 1870).

A provisional government fought on throughout the winter as Prussian-led forces besieged Paris, but the provinces were less committed to the war. National elections elected a monarchist pacifist majority headed by Adolphe Thiers. Thiers signed a peace treaty in Versailles on January 18, 1871, in which France ceded to Germany most of Alsace and the Lorraine department of Moselle and promised to pay an indemnity of 5 billion francs.

Patriotic elements in Paris found the treaty dishonorable, however, and resented the requirement that Prussian troops be allowed to ceremonially take control of the city. Tensions exploded when Thiers attempted to disarm the Parisian National Guard and take away its cannons, which had been purchased by local subscribers. After General Claude Martin Lecomte and General Clément Thomas were shot in Montmartre on March 18 as they tried to seize cannons, Thiers fled to Versailles with troops still loyal to him.

On March 26, Parisians elected a city council known as the Commune of Paris (lesser communes were formed in various provincial towns). The French term *commune* means “small town”; such administrative entities are generally governed by elected municipal councils, but Paris had not benefited from this privilege (and would not until 1977) because of its revolutionary tradition. The Commune’s supporters, or Communards, generally had leftist allegiances, as the Parisian working class had been radicalized by months of war and food shortages during a four-month Prussian siege. Some followed Louis Auguste Blanqui (1805–1881), a radical revolutionary held hostage by Thiers; others were inspired by anarchists such as Louise Michel, the syndicalist Pierre Proudhon, and the Jacobin journalist Louis Delescluze. In its short life, the Commune passed significant social legislation, including the abolition of the death penalty, pensions for relatives of veterans, and remission of various debts and rents. It was generally anti-Catholic and restored the Republican calendar. It was committed to internationalism, adopted the red flag instead of the tricolor flag, and destroyed the Vendôme Column because it celebrated Napoleon I’s battles.

Thiers, hoping to restore his authority in Paris, attacked Paris from Versailles on April 2,

1871 (the German coalition remained officially neutral, though its sympathies lay with Thiers). Fighting was brutal, culminating in the *semaine sanglante* (Bloody Week, May 21–28) as government troops reached the working-class districts of eastern Paris. The Communards, sensing defeat, burned government buildings (including parts of the Tuileries palace) and shot hostages (including the archbishop of Paris). Government troops executed even more prisoners following their victory, and the total death toll reached 18,000 to 30,000 dead. Another 7,000 Communards chose exile or were deported, many of them to French colonies in New Caledonia and Algeria.

Despite its violent birth and continued political instability, the Third Republic survived until 1940 and remains the longest-lasting French regime since the French Revolution. The Commune uprising, though ultimately unsuccessful, has been revered and studied by communists in France and elsewhere. Mao Zedong and Vladimir Illyich Lenin both admired the Commune; so did Karl Marx, who wrote a series of addresses (published as *The Civil War in France* in 1871) to draw the lessons from the revolutionaries’ defeat.

Politics of the French Third Republic

Despite chronic governmental instability, the Third Republic (1870–1940) in France intro-
duced key legislation instituting personal free-
doms, free education, and the separation of
church and state. Its diplomatic record was
mixed, as the creation of a vast colonial empire

and victory in World War I were followed by ignominious defeat in 1940.

The military disaster at Sedan (September 1, 1870) during the Franco-Prussian War prompted the population of Paris to declare the end of the Second Empire of Napoleon III (r. 1852–1870) and the advent of the Third Republic (September 4, 1870). Radical Parisian patriots (the Commune) refused to surrender as Prussians besieged the capital the following winter, but national elections brought to power a majority that was both pacifist and monarchist. The temporary government, headed by Adolphe Thiers and headquartered at Versailles, signed a ruinous peace with Germany (January 1871), then killed or exiled its radical opponents during a civil war in the heart of Paris (April–May 1871).

Despite the proclamation of the Republic, the monarchists who controlled the assembly came close to restoring monarchy in the 1870s. Heir to the throne Henri, Comte de Chambord, had many supporters until he insisted that France abandon the revolutionary tricolor. The royalist Marshall Marie Edme Patrice de MacMahon was elected president in 1873. Constitutional laws passed in 1875 failed to label the government as republican until a last-minute amendment that passed by a single vote (the Wallon Amendment). Finally, on May 16, 1877, MacMahon forced the republican prime minister Jules Simon to resign and dissolved the assembly. The republican victory in the ensuing elections had lasting consequences, as it finally marginalized the royalist camp and turned subsequent presidents into mere figureheads.

The Right, including supporters of the Orléans and Bourbon dynasties, Bonapartists, extreme nationalists (*revanchistes*), and anti-Semites, refused to participate in government until World War I, as did the Far Left including the growing communist movement. The national assembly's small, fractious republican nucleus caused much ministerial instability, and governments rarely lasted more than two years throughout the Third Republic. Political crises were endemic. General Georges Boulanger, whose aggressive nationalism was popular among Frenchmen, almost became dictator in 1889. The bankruptcy of the Compagnie Universelle du Canal Interocéanique de Panama (1889) sparked a massive scandal when it

was revealed in 1892 that the company had paid bribes to leading politicians and journalists. The conviction of the Jewish French officer Alfred Dreyfus for espionage in 1894 began 12 years of political turmoil that only abated when a court exonerated him in 1906.

Given such instability, the Third Republic's achievements were notable. Jules Ferry (premier during 1880–1881 and 1883–1885) passed two laws in 1881–1882 that, along with the Goblet Law of 1886, made primary education free, compulsory, and secular. Other laws protected freedom of the press (1881) and the right to form associations (1901) and implemented the separation of church and state (1905). Overseas, France built a colonial empire that was second only to Great Britain and stretched from North and West Africa to Indochina. The French-Russian Treaty of Alliance (1894) and the Entente Cordiale with Great Britain (1904) gave France allies that proved essential when World War I broke out in August 1914. Despite continued governmental reshuffles and the loss of 1.3 million men, the regime rallied extremist parties through a policy of national union (*union sacrée*) and eventually defeated Germany in November 1918.

The Fight for Women's Suffrage in Great Britain and the United States

The term “suffrage” simply means the right to vote, though in Europe and North America it most often refers to women's voting rights.

► THE WOMEN'S SOCIAL AND POLITICAL UNION

The Women's Social and Political Union (WSPU) was founded in 1903 by a small group of women in Manchester, England. Particularly notable among the founders were Emmeline Pankhurst and her daughter, Christabel. Both were well-educated middle-class women from a background of political activism, factors that made them particularly suitable to help lead the cause of women's suffrage in the United Kingdom.

The WSPU was distinct from its sister organizations primarily because of its tactics. While most women's suffrage groups aimed for slow change through legal political action and education, the members of the WSPU soon grew tired of waiting. After almost 20 years of peaceful yet ineffective action, the WSPU began to engage in militant, even violent, acts. By the 1910s, WSPU members were vandalizing buildings and public places with slogans, smashing windows, burning property, and bombing political targets. Particularly strong and well-trained women were picked to form a special bodyguard and intimidate opponents.

The WSPU was painted in a contradictory manner by its opponents, who called it a terrorist group and yet sneered at its members as "suffragettes," a term designed to highlight the supposed feminine weakness of the group. As the WSPU's violence escalated, however, the British government began to take the organization very seriously as a threat. Some WSPU members were beaten by police, and many were dragged off to prison. When WSPU "suffragettes" responded to their imprisonment with hunger strikes, prison guards responded with violence, including forced feedings.

It is unclear exactly what impact the WSPU had on the eventual achievement of women's suffrage in Britain after World War I. What is certain is that there was no more controversial or visible women's suffrage group in the United Kingdom, and the WSPU certainly put the suffrage movement on the front pages.

—Matthew DeFraga

The movement for women's suffrage in both the United States and the United Kingdom was a long and bitterly contested process, complete with numerous controversial incidents and tactics as well as many instances of harsh reprisals against suffrage advocates. Though women who fought for suffrage called themselves "suffragists," militant suffragists were often derisively labeled "suffragettes" by their opponents.

The outpouring of liberation sentiment engendered by the Enlightenment and the American and French revolutions late in the eighteenth century included some notable calls for women's rights, sometimes promoting suffrage. In 1791, for example, French feminist Olympe de Gouges published her treatise *Declaration of the Rights of Women and the Female Citizen*, which called for equal rights for men and women and stated that women were in all senses the equal of men. Though many eighteenth-century appeals for women's rights did not specifically mention suffrage, they set the stage for the suffrage movement by putting women and their opinions on the public stage.

The women's suffrage movement picked up steam in the United Kingdom after two 1830s' acts formally excluded women from the voting process. The fact that this same legislation (along with another in the 1840s) extended wide voting rights to British men of different classes yet kept all women disenfranchised particularly irked feminists. Inspired by the Chartist tradition and the writings of political philosophers Jeremy Bentham and John Stuart Mill (both of whom advocated women's suffrage), the first national women's suffrage group, the National Society for Women's Suffrage, was founded in 1872. The extension of the vote to all British men during the 1880s further heightened the civil inequalities between men and women, and two new and more influential groups, the National Union of Women's Suffrage Societies (NUWSS), led by Millicent Fawcett, and the militant Women's Social and Political Union (WSPU), organized by Emmeline and Christabel Pankhurst, were founded at the turn of the twentieth century.

If the vote had once been regarded as a privilege—open primarily to men of property—and

not a right, voting restrictions steadily eased for white males in the United States so that by 1830 ten states allowed all white males the vote without restrictions, and many of the states in New England had extended the vote to free black males. With this backdrop, the fight for women's suffrage on a national level picked up in the 1840s, when suffragist pioneers Lucretia Mott, Margaret Fuller, and Elizabeth Cady Stanton became active. In 1848 two key events put women's suffrage on the national political scene: the founding of the Liberty Party and the Seneca Falls Convention. The Liberty Party, though unsuccessful, campaigned on the national level for universal suffrage, among other things. More important was the Seneca Falls Convention, which was attended by most important women's suffragists in the country, including male supporters such as Frederick Douglass and William Lloyd Garrison. Though the main topic was women's rights in general, the Declaration of Sentiments drafted by the convention set the agenda for the American suffragists, who continued to hold conventions, notably the first National Women's Rights Convention in 1850. The American Civil War took the focus away from women's suffrage, but in 1869 (the same year that the Fifteenth Amendment gave the vote to all black males) two particularly influential groups were created: the National Woman Suffrage Association, led by Elizabeth Cady Stanton and Susan B. Anthony, and Lucy Stone's American Woman Suffrage Association. To increase their influence, the two groups were merged in 1890 to form the National American Women Suffrage Association (NAWSS).

Nineteenth-century ideals in Britain and the United States depicted women as the moral monitors of their families; they were expected to be good wives and mothers, confining their activities and authority to the domestic sphere. Women publicly agitating for equality with men sparked fears that national morality would erode if women were allowed to ignore their "proper" domestic role and step into the public sphere. The prominent intellectual Catherine Beecher argued that although women were in all ways equal and perhaps even superior to men, it was best not to demand the vote to maintain social stability.

Tactics used by suffragist groups tended to be peaceful. The NAWSS generally limited its actions

to public meetings and appeals to Parliament, though the 1907 Mud March through the streets of London was a more visible display. Peaceable tactics were fairly successful in the United States, where a number of states had already allowed women's suffrage when the Nineteenth Amendment was passed in 1919. In Britain, however, frustration over a lack of progress led to increasingly radical tactics, particularly by the WSPU. Women from the WSPU smashed store windows and destroyed property to gain attention for their cause. Perhaps the most disturbing act occurred at the 1913 Epsom Derby, where WSPU member Emily Davison stepped in front of the king's horse and was killed. Her exact intentions are unclear, but she was certainly trying to gain attention for the WSPU.

The outbreak of World War I temporarily shelved suffrage movements in both Britain and the United States, mainly because women were needed as factory workers, thereby gaining a measure of freedom and responsibility outside the home. After the war women were quickly given the vote in both the United States and the United Kingdom, though whether this was inevitable or given as a reward for wartime services is debated. Other nations had already granted suffrage to women, starting with New Zealand in 1893.

The Unification of Italy

Proclaimed in 1861, Italian unification actually took the first half of the nineteenth century to achieve. After French emperor Napoleon I conquered Italy during the Napoleonic Wars, he

reorganized the various states, introduced some of the ideas of the French Revolution, and deposed many of the traditional monarchical rulers. The Congress of Vienna of 1815, which redrew the boundaries of Europe after Napoleon's defeat, attempted to restore the traditional forms

THE UNIFICATION OF ITALY, 1859-1870

of government that had ruled Italy under the auspices of the Austrian empire. However, liberalism had made serious inroads during Napoleon's reign, and many Italians resented the restoration of monarchs and conservative government. Instead, they wanted to see the creation of a unified Italian state guided by a liberal constitution.

The movement for Italian unification became known as the *risorgimento*, meaning the resurgence of Italian nationalism and culture. Supporters of the *risorgimento* sparked revolts in Naples, Piedmont, Modena, Parma, and the Papal States during the 1820s and 1830s but met with little success. To better coordinate the efforts of the *risorgimento*, nationalist Giuseppe Mazzini organized a group called Young Italy shortly after the failed revolts. Young Italy led the Italian phase of the Revolutions of 1848, although unfortunately the *risorgimento* did not achieve much lasting progress during these popular uprisings.

In the decade following the Revolutions of 1848, however, the Kingdom of Sardinia-Piedmont emerged as a supporter of the *risorgimento* under King Victor Emmanuel II and the skilled diplomat Camillo Benso di Cavour. In 1859 Cavour led Sardinia-Piedmont and several other northern Italian states in a rebellion against Austrian domination, forcing the Austrian empire to recognize their independence after the battles of Magenta and Solferino. The Italians had substantial help from the French and conceded the provinces of Nice and Savoy to France as payment for this assistance after independence had been won.

With most of northern Italy free of Austrian dominance, popular revolts led by Giuseppe Garibaldi broke out in several southern provinces and proved successful. Under Cavour's guidance, Lombardy, Naples, Sicily, and several other duchies elected to annex themselves to Sardinia-Piedmont in 1860 under the rule of Victor Emmanuel II, who proclaimed the creation of a unified Italy the following year with a constitution and himself as head of state. The last provinces on the Italian peninsula to join the new nation were Venice in 1866 and the Papal States in 1870.

The Unification of Germany

Completed in 1871, German unification created a militarily and economically powerful nation-state in the heart of Europe, thereby ending centuries of German disunity and altering the European balance of power.

German unification took place against a background that included rising nationalism among Germany's professional and commercial classes and within the intellectual community; calls for a reform of the Germanic Confederation, which had been established by the Vienna Congress of 1814–1815; industrialization and a growing economic unity among the German states; rivalry between the Austrian Empire and the Kingdom of Prussia; and a European states system transformed by the Crimean War of 1853–1856. Specifically, German unification was brought about as a result of actions taken by the Kingdom of Prussia and its ambitious

Otto von Bismarck reads Prussian king Wilhelm I's Proclamation of the German Empire at Versailles on January 18, 1871, following Prussia's victory in the Franco-Prussian War. (Hulton Archive/Getty Images)

UNIFICATION OF GERMANY, 1865–1871

minister-president (prime minister), Otto von Bismarck (1815–1898).

Under Bismarck's guidance Prussia waged and won three short wars from 1864 to 1871 that allowed it to unite all German lands except Austria under its leadership. In the first of these wars, the Schleswig-Holstein War (January–October 1864), Prussia and Austria fought Denmark to prevent the incorporation of the small Duchy of Schleswig and its partly German population into the Danish kingdom. Victorious, Prussia and Austria were unable to agree on the fate of Schleswig and its sister duchy, Holstein, and these disagreements led to the Austro-Prussian

War of 1866. In the Austro-Prussian War, or Seven Weeks' War, Prussia defeated Austria and the other states of the Germanic Confederation, with the decisive battle occurring near the Bohemian village of Königgratz (Sadowa) on July 3. Victory allowed Bismarck to dissolve the Germanic Confederation, exclude Austria from German affairs, and organize the states and cities of northern Germany into the Prussian-dominated North German Confederation. As of 1867 only the continuing independence of the south German states of Baden, Bavaria, and Württemberg and the opposition of Napoleon III's France stood in the way of German unity.

► BISMARCK'S "BLOOD AND IRON" SPEECH

On September 30, 1862, Prussian minister-president Otto von Bismarck informed the budget committee of Prussia's parliament, "Not through speeches and majority decisions will the great issues of the day be decided—that was the great mistake of 1848 and 1849—but through iron and blood." Immediately mislabeled the "Blood and Iron" speech, Bismarck's statement has been occasionally, and inaccurately, interpreted as a sign that the minister-president had in mind a

concrete strategy, relying on military force, to achieve German unification under Prussian leadership. In reality, Bismarck's words were designed to win over the liberal opposition, which had blocked King William I's efforts at army reform since 1860. Still, Bismarck's declaration foreshadowed the actual methods that Prussia employed to create the German Empire.

—Bruce DeHart

The Franco-Prussian War (June 1870–January 1871) provided Prussia the opportunity to remove both obstacles. Supported by the other members of the North German Confederation and the south German states, Prussia defeated France easily, toppling Napoleon III and leaving the French unable to stop unification. Moreover, as the fighting went on, ardent nationalism spread throughout southern Germany, and Bismarck used this fervor to persuade the rulers of Baden, Bavaria, and Württemberg to join with the states of the North German Confederation to form the German Empire.

Formally proclaimed at the Palace of Versailles on January 18, 1871, the German Empire was to be headed by the Hohenzollern Dynasty of Prussia, whose king, William I (1861–1888), became German emperor William I. With the advantages of a growing population of 41 million, the world's best army, and a rapidly industrializing economy, the German Empire immediately superseded France as the leading continental power. In the ensuing decades newly unified Germany developed global aspirations that contributed to the coming of World War I in 1914.

Nationalist Revolts in the Balkans

The nineteenth century in the Balkans was marked by the rise of successive nations in search of identity and statehood against Ottoman rule. The first major nationalist revolt in the Balkans occurred in 1804 when the Serbs rose to challenge the half-millennium-long Ottoman presence in the region. The Ottomans had advanced their control over the Balkans up to the so-called Danube-Sava line (running westward from the Black Sea along the Danube and Sava rivers to the Adriatic) between 1345 and 1529 when they attempted (but failed) to take Vienna. The 9 million predominantly Orthodox Christians who lived in the region were administered, as was the entire Ottoman empire, according to the *millet* system, which divided and administered the population according to religious affiliation, thus allowing some measure of regional autonomy. As the general strength and prosperity of the Ottoman state declined in the eighteenth century, however, the burdens of increasingly heavy taxation, privileges for the Muslim minority, and general abuse by and corruption of the bureaucracy became insupportable to the Balkan people.

Sensing the waning of Ottoman power, the region was already producing rebellions against Ottoman domination several decades prior to 1804, but these were sporadic, poorly organized, and ultimately futile efforts by disunited subjects against a still overwhelmingly superior power. However, by the start of the nineteenth century three things had changed: the Ottoman empire had slid irrevocably into decline (soon to

THE BALKANS, 1878–1913

be known as the “Sick Man of Europe”); other major European powers, such as Russia and Austria, had become interested in resolving the “Eastern Question” to their own benefits; and the Balkan peoples had, under the influence of the French Revolution and the Napoleonic Wars, begun to organize themselves into aspiring nations in pursuit of statehood. The result was that by the end of the nineteenth century,

five independent states had emerged in the Balkans: Serbia, Greece, Bulgaria, Romania, and Montenegro.

The Serbian revolt of 1804–1812 was led by George Petrovich (1768–1817), known as Kara-george (“Black George”) for his bellicose character and dark appearance; despite financial and military support from Russia, it was still crushed by the Ottomans in 1812. Nevertheless, the

revolt inspired not only successive generations of Serbs but also other Balkan peoples to challenge Ottoman sovereignty. Through the diplomatic efforts of Milos Obrenovich, the Serbs won from the beleaguered Ottomans the right to their own monarch and a form of autonomy in 1830. After Piedmont's successful unification of Italy in 1859, the Serbs then asserted themselves to be the "Piedmont of the Balkans," suggesting their desire to unite all southern Slavic peoples into a single Serb-led state.

The next to rise were the Greeks under the influence of Philike Hetairea, a secret Philhellenic society, who were aided in their efforts by the British, French, and Russians and in 1830 won their independence. Moldavia and Wallachia received autonomy from Ottoman control in the wake of the Crimean War from the Great Powers of Europe (who were concerned with keeping Russia at a distance from the straits leading into the Mediterranean) at the Congress of Paris in 1859 and shortly thereafter united in a Romanian state. The Bulgarians rose in 1876 with Russian backing and won their independence in 1878. That same year at the Congress of Berlin, Serbia and Montenegro were both granted full independence by the Great Powers of Europe.

Undermined from within by their own economic decline and challenged from without by aspiring small nations backed respectively by European Great Powers, the Ottoman empire was forced out of Europe in the Balkan Wars of 1912–1913, retaining only Constantinople and the small section of Thrace surrounding the city.

Political Developments in Britain, 1815–1914

British politics in the nineteenth century revolved around the gradual progress toward a modern parliamentary democracy while avoiding the political uprisings that plagued much of continental Europe. This period also saw the emergence of strong political parties and party organizations that sought to sway the new electorate.

By the early nineteenth century the British political system had in some ways adopted modern features, such as the importance of the office of prime minister, the authority of the elected House of Commons over the hereditary House of Lords, and the removal, on most questions, of the monarch from active politics. In other respects, however, the political system remained antiquated. For example, representation in the House of Commons was given to towns and villages that had long since declined in population or even disappeared (these seats being known as rotten boroughs), while the franchise was strictly limited. Most political figures were either Whigs or Tories, with the term "Tory" gradually giving way to the term "Conservative" beginning in the 1820s. In the early 1800s these were associations without rigid party discipline or central control.

However, the desire for political reform increased in the late 1820s. The Roman Catholic Relief Acts of 1778 and 1791 had allowed Catholics to own property, inherit land, and join the army and had given propertied Catholics the right to vote. These were soon followed by increasing demands for changes to the political system itself. The result was the First Reform Act of 1832, proposed by the Whig government of the second Earl Grey, and supported by widespread public agitation. This act significantly altered the political system through the redistribution of seats in Parliament, with some rotten boroughs being disenfranchised and new industrial cities gaining representation for the first time. Equally important, the franchise was extended, and many middle-class men received the vote for the first time. However, the working class remained excluded; this led to the rise of the Chartist movement in the 1830s and 1840s, which demanded further political reforms.

However, these demands were refused, and the movement dissolved by the end of the 1840s.

The Conservative government of Sir Robert Peel of the early 1840s was confronted by the issue of free trade, symbolized by the large-scale middle-class protest against the Corn Laws, which applied duties on imported wheat. The repeal of the Corn Laws in 1846 by Peel's government constituted a triumph of laissez-faire economics but split the Conservative Party, with the departure of Peel and his supporters. In time the Peelites would join together with the Whigs to form what came to be known as the Liberal Party. A leading political figure of the 1850s and 1860s was the Whig politician Lord Palmerston, who served as prime minister for two terms. He appealed to patriotic sentiment in the British public through an aggressive foreign policy, although domestically he remained opposed to further political reforms.

Palmerston's death in 1865 opened the possibility of reform, and in 1867 the Second Reform Act was passed. This act mandated a further redistribution of seats in favor of the new industrial centers and widened the franchise to include, for the first time, elements of the working class. The Third Reform Act of 1884 expanded the franchise to rural laborers, while other reforms in the interim resulted in the secret ballot and forbade certain corrupt electoral practices. As a result of these reforms, political parties found that they had to devise new ways to reach and influence the expanded electorate. The result was increased party organization, which included not only new campaign strategies but also more stringent party discipline in the House of Commons. Members of Parliament became increasingly tied to their party, and their scope for independent action was diminished.

Politics in the years after the Second Reform Act were dominated by William Ewart Gladstone, leader of the Liberal Party, and Benjamin Disraeli, leader of the Conservative Party. The latter attempted with some success to identify the Conservative Party with the rising tide of imperialist sentiment in Britain. The two leaders exchanged successive election victories until Disraeli's death in 1881. In the mid-1880s Gladstone took up the cause of Irish Home Rule, whereby Ireland, ruled by Britain with

British prime minister William Gladstone introduces his Home Rule Bill in Parliament in 1886. (Chaiba Media)

representation in the House of Commons, would be given its own parliament to deal with domestic affairs. This split the Liberal Party, with those in disagreement, including the bulk of the aristocracy, leaving the party and forming the Liberal Unionist Party. The latter formed an electoral alliance with the Conservatives until the two formally merged in 1912. The Liberal split over Ireland led to 20 years of almost uninterrupted Conservative rule under Lord Salisbury and subsequently Arthur Balfour. These governments acted to maintain and expand the British Empire, epitomized by the Boer War, and also implemented limited social reforms.

By the early 1900s a movement had emerged within the Conservative Party in favor of abandoning free trade, but the voting public remained sceptical, and the Liberal Party was returned in a landslide victory in 1906. The Liberals would remain in power through 1914 and pushed through a series of social reforms

► WILLIAM EWART GLADSTONE

William Ewart Gladstone (1809–1898) began his political career in 1832 as a Conservative member of Parliament but left that party in 1846 with Sir Robert Peel over the issue of free trade. In the 1850s and 1860s Gladstone served several terms as chancellor of the exchequer, delivering a series of budgets that set the standard of Liberal finance that included low government expenditure, the elimination of tariffs, and balanced budgets. By the late 1860s he began to champion radical solutions to issues such as the disestablishment of the Irish Church, and on such a platform he won his first election as leader of the Liberal Party in 1868. His governments of 1868–1874 and 1880–1885 passed a number of reforms, and he also transformed politics by speaking directly to the growing electorate at mass rallies such as in his Midlothian campaign of 1879. His adoption of the cause of Irish Home Rule in 1886 severely split the Liberal Party, and he retired from politics in 1894 after twice failing to get a Home Rule measure passed by House of Commons.

—Wesley Ferris

including old-age pensions and unemployment insurance, both of which were financed by the imposition of graduated taxation through what came to be known as the People's Budget of 1909. The powers of the House of Lords to veto legislation passed by the House of Commons were also removed through the Parliament Act of 1911 after the House of Lords had initially refused to pass the People's Budget. This period also saw the rise of the Labour Party, a coalition of trade unionists and socialists that advanced the causes of the working class and gained significant representation in the House of Commons for the first time in 1906. Before World War I Labour generally cooperated with the Liberals in an electoral alliance that, despite a certain amount of friction, did not indicate that the former would supplant the latter as the party of the progressive Left.

By 1914 the problem of Irish Home Rule again dominated British politics, with the outbreak of armed revolt in Ireland now a distinct

possibility. However, the sudden start of World War I put a temporary end to domestic political conflicts, although in the long run the war would permanently transform British politics.

Political Transformations in Austria-Hungary, 1815–1914

The series of political transformations that occurred in Austria-Hungary between the Congress of Vienna (1815) and the outbreak of World War I resulted in the decentralization of the Austrian empire. Conflict between the liberal or nationalist aspirations of the various regions of the empire and the Habsburg monarchy's goal of a unified empire characterized the political climate of the period. The Austrian sphere of influence also shifted from leadership among the Italian and German states to territorial interests in the Balkan regions. Successive Habsburg emperors proved unwilling to embrace both a decentralized empire and a changing sphere of influence for the monarchy. The result was a decline in the monarchy's popularity, contributing to the eventual collapse of the Habsburg empire in 1918.

The concept of the Habsburg inheritance as an empire, ruled from the Austrian capital of Vienna, arose in 1804 when King Francis I assumed the title of "Emperor of Austria." Napoleon Bonaparte's dissolution of the Holy Roman Empire in 1806 left the Austrian empire as the largest unified political entity in Europe. When Emperor Franz Joseph ascended the throne in 1848, the empire included Austria, Hungary, Bohemia, the Italian regions of Lombardy and Venetia, Galicia, and the Grand Duchy of Cracow.

The Austrian empire emerged victorious from the Napoleonic Wars. Through the

negotiations of the gifted foreign minister Prince Klemens von Metternich (1773–1859), the Austrian empire emerged from the Congress of Vienna as the leader of the German Confederation and as the dominant power in Italy. Metternich advocated the maintenance of a strong centralized monarchy in the Austrian empire and opposed the development of liberal independent regimes in central Europe.

Metternich's policies led to widespread discontent in numerous regions of the Austrian empire, particularly in Hungary and Italy. This discontent culminated in the revolutions of 1848, when the young emperor Franz Joseph faced a war in northern Italy and an insurrection in Hungary. The imperial armies recaptured the rebellious Italian cities and imposed a police state on Hungary, resulting in the exile of numerous members of the liberal aristocracy and revocation of the traditional Hungarian Constitution. The surviving Hungarian elites continued to foment rebellion in Hungary until Franz Joseph agreed to transform the empire into the dual monarchy of Austria-Hungary in 1867.

Austrian ascendancy among the German and Italian states collapsed during the same period. Lombardy and Venetia had remained under military control after the suppression of the 1848 revolution. Franz Joseph's refusal to accept Italian demands for reform led to defeat in the Italian war of 1859. Habsburg attempts to maintain dominance of the German confederation conflicted with Prussian ambitions, forcing Franz Joseph to concede his leadership position in Germany during the Austro-Prussian war of 1866.

During the late nineteenth century, the foreign policy of the Austro-Hungarian empire focused on control over the Balkan states of the declining Ottoman empire. The annexation of Bosnia-Herzegovina in 1878 upset the balance of the dual monarchy and caused tensions with Russia. Franz Joseph addressed these issues by forbidding the inhabitants of the newly annexed territories from seeking Austro-Hungarian citizenship, contributing to widespread discontent in the region. This unstable environment in the Balkans eventually resulted in the Balkan Wars of 1912–1913 and precipitated the outbreak of the First World War, with the assassination of

➤ EMPRESS ELISABETH AND THE DUAL MONARCHY

Elisabeth of Bavaria, wife of Emperor Franz Joseph, supported Hungarian self-government under a dual monarchy and formed close friendships with many members of the liberal Hungarian aristocracy. The empress learned to speak fluent Hungarian in the 1860s and used her influence over Franz Joseph to advocate the transformation of the Austrian empire into a dual monarchy. Her support for Hungary, to the exclusion of the rights of her non-Hungarian subjects, aroused the disapproval of the court in Vienna, which contained many Bohemian nobles who had remained loyal to the Habsburgs in 1848. Elisabeth ignored this criticism, furthering the career of the nationalist Gyula Andrássy, who became the first constitutional prime minister of Hungary in 1867.

Poland under Russian Rule, 1772–1918

The Polish Commonwealth (*Rzeczpospolita*) disappeared from the map of Europe after more than a century of internal decline and three successive partitions by its neighbors Russia, Prussia, and Habsburg Austria in 1772, 1793, and 1795. Other than the experience of a Duchy of Warsaw (created by Napoleon) between 1807 and 1813 and the Congress Kingdom, a quasi-autonomous state under Russian protection that existed between 1815 and 1864, Poles lived under the direct rule of the three partitioning states.

Poles living in the Russian Partition were governed according to the three pillars that upheld

THE POLISH NATIONAL ANTHEM

The Polish National Anthem was written by Józef Wybicki in 1795 to commemorate the departure of Polish legions, led by General Henryk Dąbrowski, to fight alongside Napoleon Bonaparte. After the failed Kosciuszko Revolt, many Poles immigrated to France and joined Bonaparte's forces in the hope that Bonaparte would restore Polish autonomy and establish a new Polish state.

"Poland has not yet perished,
So long as we live.
What foreign violence has robbed from us,
We will reclaim, sword in hand.

March, march, Dąbrowski,
From the land of Italy to Poland.
Following your leadership
We will become a single nation.

We'll cross the Vistula, we'll cross the Warta,
And we shall be Poles.
Bonaparte gave us the example
How to be victorious.

March, march Dąbrowski . . .

As Czarniecki went to Poznań
After the Swedes overran us,
To save our country
We will return across the sea.

March, march Dąbrowski . . .

As a father said to his Basia,
Tears in his eyes,
'Listen, now, are those our boys
Beating the drums?'

March, march, Dąbrowski . . ."

the entire Russian state: Orthodoxy, Autocracy, and Nationality (that is, Russian nationality). For the largely Catholic Poles, whose political history had been dominated by the Republic of Nobles with an elected monarch (in stark contrast to the autocratic system practiced in Moscow) and whose cultural history emphasized a Western orientation, inclusion in the Russian state, an ancient enemy, could hardly have been less congenial. Thus, it is not surprising that the period of partition was marked by repeated armed revolts against Russian control. While Russian rulers varied in their attitudes toward their Polish subjects, the general policy was to weaken and extinguish the Polish national consciousness.

The repeated Polish uprisings followed a clear pattern: efforts at reform provoked Russian repression, which was followed by violent uprising. After the first partition of 1772 the last king of Poland, Stanislaw-August Poniatowski, undertook extensive political reforms inspired by the early French Revolution. These reforms culminated in the progressive Constitution of May 3,

1791. Catherine II of Russia could not tolerate this and in 1793 instigated the Second Partition, which provoked the Kosciuszko Revolt in 1794, and finally in 1795 the Third Partition. Under these circumstances, it is easy to understand why, under the slogan "For Your Freedom and Ours!" Polish Legions soon became Napoleon's favorite troops.

After the Congress of Vienna in 1815 Poles tried to make the most of their purported autonomy within the Congress Kingdom under the rule of Alexander I of Russia, who toyed with ideas of constitutionalism. However, when he was succeeded by his reactionary brother, Nicholas I, and when France again threatened to explode in revolution in 1830, the Poles revolted and deposed the tsar. The military repression that followed culminated in the Organic Statute of 1832, which severely curtailed Polish autonomy and resulted in the Great Migration of Polish insurrectionary leaders to France.

The January Uprising of 1863 was the next generation's effort to wrest independence from

Russia during a decade of internal upheaval and reform in the Russian empire under the “Great Emancipator,” Alexander II. It was also crushed by the Russian Army, and the Congress Kingdom was formally terminated in 1866. During the rest of the nineteenth century Poles turned to Organic Work, an effort to build economic and moral strength in the nation even while the Russian state subjected them increasingly to policies of Russification. These policies included decreeing Russian as the official language of Vistulalands, as the Polish lands now were called. Although Poles received some representation in the Duma (first legislature) in imperial Russia in 1906, such gains were reduced in the conservative electoral reform of 1907.

World War I created deep divisions in opinion about whether nationalist Poles should align themselves against the Germans or the Russians. These divisions culminated in the split between Roman Dmowski, representing Poles diplomatically in Paris at the Peace Conference in 1918, and Jozef Pilsudski, who organized the Polish Legions to fight against the Russians in a war of independence that climaxed at the Battle of Warsaw in 1920. This battle resulted in Poles gaining extensive eastern lands and ended only in March 1921 with the Treaty of Riga. The era of Partitioned Poland came to an official end with the recognition in Paris of the principle of Polish independence on June 3, 1918.

Russia to 1905

As is true for so many states around the world, the history of Russia from 1750 to 1905 was

dominated by the imperative to respond to the challenges of the modernizing West. While Peter I (r. 1682–1725) had become “the Great” due to his efforts to Westernize Russia at the start of the eighteenth century, Russia continued to struggle in keeping up with the West. Thus, Russian rulers throughout this period were challenged over and over again. As they attempted to meet the challenge with inadequate resources, they tended to concentrate at the top levels of government and society and neglect the impoverished peasantry. This created a schism within Russian society that ultimately proved impossible to mend.

Peter's daughter Elizabeth I, who ruled between 1741 and 1762, is remembered particularly for ways in which she worked to further the Westernization of Russia's ruling elite. She did so by requiring the gentry to send their children abroad to study and importing the Italian architect Rastrelli to continue the efforts of her father to make St. Petersburg the finest capital city in Europe. She also involved Russia in all European diplomacy and its two major wars, the War of the Austrian Succession (1740–1748) and the Seven Years' War (1756–1763). All of this cost a great deal of money, which she squeezed from the peasantry through heavy taxes. Throughout the eighteenth century as the stock of the gentry rose, that of the peasants declined. The gentry were granted privileges (such as exemption from service to the state under Peter III in 1764), while the serfs lost what few rights they had previously enjoyed.

This trend reached its peak under Catherine II (r. 1764–1796), who despite her ambition to be known as an enlightened monarch, rendered about 1 million “Crown peasants” into servitude to private owners, extended the geographic reach of serfdom into the Cossack lands, and deprived peasants of the right to petition the empress for redress of grievances. Catherine became known as “the Great” primarily for her successful expansion of the Russian state, taking the north shore of the Black Sea up to the Dniester River from the Turks in a series of three actions between 1768 and 1794 and instigating the three partitions of Poland with Austria and Prussia in 1775, 1793, and 1795.

Alexander I (1804–1825), Catherine's grandson, was the first Russian ruler to seriously

► IDEALS OF THE DECEMBRIST REVOLT

Peter Kakhovsky was a Russian army officer and an active participant in the Decembrist Revolt of 1825. He failed to carry out his task of assassinating Tsar Nicolas I but killed two high army officers, a crime for which he was hanged in 1826. Before Kakhovsky died he wrote the following defense of his actions in a letter to a superior officer:

“The people have conceived a sacred truth—that they do not exist for governments, but that governments must be organized for them. This is the cause of struggle in all countries; peoples, tasting the sweetness of enlightenment and freedom, strive toward them; and governments, surrounded by millions of bayonets, make efforts to repel these people back into the darkness of ignorance. But all these efforts will prove in vain; impressions once received can never be erased. Liberty, that torch of intellect and warmth, was always the attribute of peoples emerged from ignorance. We are unable to live like our ancestors, like barbarians or slaves.”

—Anita Shelton

Peter Kakhovsky, “Extract from a Letter of Kakhovsky to General Levashev,” quoted in Anatole G. Mazour, *The First Russian Revolution, 1825: The Decembrist Movement; Its Origins, Development, and Significance* (Stanford, CA: Stanford University Press, 1937), 274.

consider both the emancipation of the serfs and constitutionalism as reforms essential to the continuing modernization and Westernization of Russia. However, he interpreted the invasion by Napoleon and his Grande Armée in 1812 as a challenge to Russia’s special mission as the “Third Rome,” or last protector of Orthodox Christianity. Thus, although his reign began with expectations of Western-inspired reform, it ended on a reactionary note. Alexander’s role at the Congress of Vienna in 1815 and as organizer of the Holy Alliance of Russia, Prussia, and Austria against further revolution in Europe confirmed his status as a reactionary. His brother, Nicholas I, who succeeded him in 1825 after defeating the short-lived challenge to his succession of the Western-inspired Decembrist Revolt, was

a thoroughgoing reactionary both at home and abroad. At home, Nicholas countered the pull of the West with a reaffirmation of Russian tradition, advancing the idea that the Russian state rested on the “three pillars of Orthodoxy, Autocracy and Nation.” Abroad, he became known as the “Gendarme of Europe” for his willingness to repress revolutions beyond his own borders (notably in Poland in 1830 and Hungary in 1848).

Ironically, although Russia reached a peak in its role and reputation in the West under Alexander I and Nicholas I between 1815 and 1854, its defeat in the Crimean War (1854–1856) exposed Russia’s fundamental weaknesses: an agrarian economy that was inadequate to support a modern Great Power and an autocratic political system that alienated the educated elite. Alexander II (1854–1881) realized this and was determined to pull Russia through a program of systemic reform. This resulted in the Great Reforms of 1861–1866. The greatest of the reforms was the emancipation of the serfs in 1861. Unfortunately, the terms of the emancipation did not provide the means for newly emancipated serfs to progress economically, and by the end of the century most Russian peasants were materially worse off than ever. Other reforms, including reforms of the army, the judiciary, and provincial administration, were aimed at creating a modern rule-based state on the Western model, short of a constitution. Repeated attempts on the tsar-liberator’s life in the 1860s as well as an uprising in the Polish part of the empire soured Alexander II on reform. His assassination in 1881 confirmed his successor, Alexander III, as a thoroughgoing reactionary. Alexander III, as well as his successor, Nicholas II, embraced the three pillars of Orthodoxy, Autocracy and Nationality even as they pursued economic modernization and industrialization.

When the alienated educated elite (the intelligentsia), the alienated, uneducated, and impoverished peasantry, the alienated non-Russian nationalities of the empire, and the small but growing proletariat all turned against the state by the end of the nineteenth century, the autocracy was largely isolated. In that condition, there was little it could do to stave off the disasters of the Russo-Japanese War and the Revolution of 1905.

Liberalism

Liberalism in the nineteenth century was a movement that carried forth the ideals of the early moderate phase of the French Revolution. It was strongest in the United States, Britain, and France, but movements calling themselves liberal were found in many places. It had a generally positive orientation to the future. Liberals often assumed that social and political problems are caused by the persistence of archaic institutions such as serfdom, noble privilege, economic overregulation, or religious persecution. Problems could be solved by rationally examining those institutions and abolishing things that no longer worked. Liberalism is often identified with the middle classes, or bourgeoisie, but not all liberals were middle class, nor were all members of the middle-class liberals. English liberalism in particular had a substantial aristocratic presence, the legacy of the Whig Party of the eighteenth and early nineteenth centuries. However, many aristocrats left the Liberal Party in the late nineteenth century as it moved leftward.

Liberals believed in a government of defined and limited powers, with some division of executive and legislative authority. Whether a government took the form of a republic or a monarchy was less important, and many liberals supported constitutional monarchy, a combination of hereditary monarchy and limited powers. The Orleans monarchy that ruled France between 1830 and 1848 was heavily influenced by liberalism. Government needed to be responsible to an electorate, but most liberals were not democrats; they believed that the franchise should be restricted to property holders, those who had a stake in society. Different liberals drew the line in different places, and the general tendency in the nineteenth century was for

LIBERALISM IN CHILE

Parties calling themselves liberal appeared in many places in Latin America in the nineteenth century. In some cases, the party's "liberalism" was limited to the use of the name: the short-lived Mexican Liberal Party of Ricardo Flores Magon (1874–1922), founded in 1906, was a radical anarcho-syndicalist group fomenting the revolutionary overthrow of dictator Porfirio Diaz (1830–1915). One Latin American party somewhat closer to the liberal mainstream was the Partido Liberal of Chile, founded in 1849. Like many Latin American liberals, the Partido Liberal derived much of its energy from anticlericalism in an area where the Roman Catholic Church remained a powerful religious monolith. In other areas, the party's policies were not that different from those of its main opponent and sometime ally, the Chilean Conservative Party, founded in 1851. The Chilean Liberals used corruption and shunned the electoral appeals to the masses made by some European liberals. Factionalism was a problem, and the Partido Liberal went through a dizzying array of splits and mergers, spawning such entities as the Liberal Democratic Party (1875–1876), the Independent Liberal Party (1885–1930, 1931–1933), the second Liberal Democratic Party (1893–1933), and the United Liberal Party (1930–1933). In 1966 Partido Liberal merged with the Conservatives to form the National Party.

—William E. Burns

liberals—and sometimes their opponents—to admit larger numbers of people to the vote. Very few nineteenth-century male liberals believed in admitting women to the franchise, however; the most notable exception was the English philosopher and politician John Stuart Mill (1806–1873).

Liberals supported the "science" of political economy as it developed in Britain in the late eighteenth and early nineteenth centuries. Liberals, particularly in England, supported free trade, an idea endorsed by political economists such as David Ricardo (1772–1823). Free trade became the ideological center of the British Liberal Party, although the agriculturally protectionist Corn Laws were actually abolished in 1846 by the conservative Sir Robert Peel (1788–1850). In less economically developed areas, liberals sometimes

supported protection to enable their countries to build their own industrial sectors. This was seen as a temporary measure. Liberals believed that the division of society into economic classes was permanent. They opposed the privileges of the aristocracy and supported “careers open to the talent,” the eligibility of every qualified man, regardless of his class background, for every job. The self-made man was an icon of liberalism. Liberals were individualists, believing that the best way to elevate people was not to raise the status of the classes they belong to but instead to encourage the good habits that lead people to rise as individuals and discourage the bad habits. Liberals were generally suspicious of the poor and the working class because the poor did not have property, the precondition of social responsibility, and liberals despised a paternalistic attitude to the poor, which they associated with the aristocracy of the old regime. Some liberals argued that measures to alleviate the plight of the poor actually increased human misery, as they decreased the incentive for individuals to rise via hard work. The lives of the unemployed poor should be made as unpleasant as possible to discourage laziness. The English Poor Law of 1834, the work of a liberal government, set up a system of workhouses—with tedious, unproductive labor; deliberately unpleasant food; and the separation of families—to discourage poverty.

Organizations of workers using their collective power to get a better deal—labor unions—were considered by many, but not all, liberals as an illegitimate interference with the individual’s right to sell his labor, although liberals supported other forms of worker organizations such as mutual aid societies. The attraction of the poor and working class to socialist parties later in the century would add to liberal hostility. On the European continent, liberals were often willing to make alliances with traditional conservatives against the menace of radical democracy and socialism, particularly after the revolutionary outburst of 1848. In Britain, where socialism was relatively weak, liberals remained in a loose alliance with labor to the end of the nineteenth century.

Liberals supported freedom of the press, although they were much less enthusiastic about freedom for the socialist and radical press than

for the liberal press. Liberals strongly supported freedom of religion and believed in paring back, or perhaps entirely eliminating, the prerogatives of state churches. The poor, like women, were uneducated and were believed to be under the sway of the churches, another reason for excluding them from politics. Secular education was a great liberal cause particularly in France, where liberal politicians François Guizot (1787–1874) and Jules Ferry (1832–1893) were responsible for expansions of the public education system. Civil marriage, which took marriage out of the hands of the church and put it in the hands of the liberal state, was another liberal cause. Religious minorities—Protestants in France, Protestant Dissenters in England, Jews throughout Europe—were more likely to support liberalism as a way of ending prejudice and discrimination toward them. Protestants were more liberal than Catholics, and liberal Catholics often had difficulty reconciling their political and religious positions, particularly as the papacy was always strongly opposed to liberalism. Those liberals who were religious often kept their religious commitment out of politics. England, with a tradition of liberal Evangelicalism, was a partial exception.

After the revolutions of 1848, liberals, already powerful in Britain, played an increasing role in the government of other European states. Although European liberals supported the abolition of slavery, liberalism was compatible with racism, and liberal statesmen like Ferry often supported imperialism. Liberal imperialists considered the establishment of colonies and emigration from Europe as an alternative to socialism for solving social problems, which grew particularly acute with the economic depression of the late nineteenth century.

Conservatism—French Revolution to WWI

Conservatism is a set of political and philosophical ideas and attitudes that values the traditions and ways of the past and resists most political change, especially change brought about by violence or force. French royalists, particularly Chateaubriand (1786–1848), first used the term conservatism to describe their opposition to the French Revolution. The opponents of the Revolution explained their stance by saying they wished to conserve the traditions of the past that they valued such as the monarchy and the church.

In England, the most important early apologist for conservatism was Edmund Burke (1729–1797), whose *Reflections on the Revolution in France* (1790) is regarded as one of the founding statements of conservative political philosophy. Burke wrote that change by violent revolution would always end in tragedy because societies behave according to habits and traditions that are developed over long periods of time. Lasting and valuable change, he argued, cannot be imposed by fiat; due to the complexity of society, change can only be accomplished incrementally over generations. In England, the conservative party, known as Tories, also arose in opposition to a revolution, the Glorious Revolution of 1688, but it did not assume the title of “conservative” until a century later, after the French Revolution. The English Tories, like the French royalists, also revered the monarchy and the established church. Throughout the nineteenth century Tories resisted political changes such as the Great Reform Bill of 1832 and subsequent reform measures that would, by 1920, transform the British government into an elective democracy with nearly universal adult suffrage.

In much of continental Europe, the Conservatives also resisted democratic change, often attempting (as did the Tories in Britain) to protect the privileges of the nobles and the rulers, but also those of the established churches (whether Catholic, Protestant or Orthodox). The conservative governing classes of Europe attempted to restore the status quo as it was before the French Revolution and the Napoleonic Era, but the Congress of Vienna (1815) system they established became abraded by a series of radical

revolutions, the most important of which were the Revolutions of 1848. The near success of these democratic revolutions frightened many European conservatives, who, led by Russian czar Nicholas I (r. 1825–1855), suppressed some by military force.

Some European conservative leaders, particularly Prime Minister Benjamin Disraeli of Britain (Prime Minister, 1868–1870, 1874–1881), Chancellor Otto von Bismarck (Prime Minister of Prussia 1862–1898, Chancellor of German Empire 1871–1898), and Alexander II of Russia (r. 1855–1881) were subtler. These men attempted to beat the liberals at their own game by stealing their thunder. Disraeli startled the British Conservatives by securing the passage of the 1867 Reform Bill, which substantially broadened the franchise in Britain. Bismarck, the father of the German Empire, insisted on universal manhood suffrage in the German Imperial Reichstag (Parliament), and later, passed universal health care and other social welfare measures, making Germany the first European state to do so. And Czar Alexander II issued a series of reform measures, including, importantly, the Emancipation Manifesto abolishing serfdom, thus freeing about 33 million peasants from the control of the landlords. The Emancipation of the Russian serfs (1862) is coeval with the freeing of the slaves in United States. Alexander II remarked that he preferred “revolution from above” to revolution from below.

The continental European conservatives in Catholic countries, such as Italy, Spain, Portugal, France, Austria-Hungary, and South Germany were especially interested in maintaining the social primacy of the Catholic church, arguing for church control of education, the special privileges of the clergy, as well as (in Italy and Spain) imposing specific disabilities on Protestants and other non-Catholics. In some countries, such as Spain and some of the Spanish American republics, as well as the French Catholic Province of Quebec, the church maintained and taught its lay congregants that the church was superior to secular authority and that a Catholic’s highest loyalty should be to the Pope, rather than to secular rulers. This teaching, sometimes called ultramontanism, inspired political turmoil in several Catholic lands, such as France, Spain,

Mexico and Quebec in the late nineteenth century and early twentieth century.

In much of Latin America, during the nineteenth century, there was a protracted political struggle between the Liberals, also known as the *Colorados* (Reds), and the Conservatives, who were called *Blancos* (Whites). In some republics, such as Uruguay, Paraguay, Colombia, and Mexico, savage civil wars raged between the two factions. Almost always these civil wars were resolved by the emergence of a dictator (*caudillo*). Some Latin American caudillos were Blanco, but many were Colorado.

In Latin America the Conservatives were the champions of the colonial past: they supported the prerogatives of the church (including the church's position as the chief landowner in some countries) and the social position and political privileges of the Europeans (*criolos*), especially as large landowners. The Liberals, also mostly *crioles*, were more secular. They commonly tried to undercut the exalted political and economic position of the church, advocated the secularization of lands held by the church, called for religious freedom, and supported free trade and the laissez-faire economic policies of the British liberals. Neither the Latin American conservatives nor liberals valued the lower class mestizos and Indians except to serve in the armies and die in their frequent civil wars.

In their zeal to find value in the traditions of the past, conservatives often constructed interpretations of the past that supported their views. Such were the Russian conservatives known as the slavophiles, who thought they discovered idyllic village democracy in the peasant village council, the *mir*. The slavophiles were reacting to the program of change being advocated by the westernizers, who wished to change Russia into a European-style capitalist constitutional democracy. The westernizers especially wished to abolish serfdom and dismantle the autocratic government of the czars. (This was the mainstream of the westernizers; a minority faction, from whom the Bolsheviks developed, simply wished to use western technology but not political democracy.) The conservative slavophile reacted against the westernizers' program by emphasizing their devotion to czarist autocracy and Orthodox Christianity.

Many cultures reacted against the changes brought about by the growth of European colonial empires by turning to their past traditions to find strength to resist. The many Muslim groups, in particular, determined to conserve the traditions of their past glories to regain their freedom from the colonial empires that had conquered them. Among these, the Deobandi were perhaps the most effective of these conservative Muslim movements. Named after a madrasah (religious school) founded in Northern India in 1866, the Deobandi teach an austere and puritanical form of Islam. Their message is that the present states in which the Muslims dwell are ephemeral and should not be the focus of Muslims' loyalty. The devout Muslim, they hold, should be loyal only to the worldwide Muslim community (*umma*). From their religious schools in Northern India, the Deobandi sent missionaries throughout the Muslim world to teach the duty of struggling (*ji-had*) to bring about the political unity of Dar al Islam (the Muslim world). The Deobandi persist as a small, but very dedicated minority among Muslims.

As indicated above, conservatism is a political stance which started out in resistance to change ("conserving" the traditions of the past) but which has sometimes developed into a drive for change from a perceived lamentable present to a golden age of an imagined past.

Republicanism

Republicanism is the belief in government, direct or representative, by a citizen class, with no hereditary or sacred monarch. The citizen class may be defined on either a broad or a narrow basis, although many republicans were suspicious of democracy, which they feared allowed participation by persons who lacked the virtue

or social responsibility to participate as citizens. The general tendency in the nineteenth century was for republicanism to become more democratic among males, although republicans often opposed the enfranchisement of women, who were viewed as lacking the public virtue necessary for republican citizens. A radical ideology in the Enlightenment, republicanism became more mainstream in the nineteenth century, but republican regimes were still uncommon in Europe in 1914. However, over the same period republicanism established near-total domination of the Americas and spread to Africa and Asia.

Enlightenment republicanism drew from both the experience of contemporary republics and the example of ancient ones, particularly Sparta and the Roman Republic. It was also influenced by the social and political thought of Jean-Jacques Rousseau (1712–1778), himself a citizen of the Republic of Geneva, a source of pride to him throughout his life. Rousseau associated republicanism with male virtue and believed that it was best limited to small city-states like Geneva or early republican Rome. The appeal of republicanism in the Enlightenment was limited by the fact that Europe's historic republics such as Geneva, the Dutch Republic, and Venice were declining, as was the most republic-like monarchical government, that of Poland. The reputation of republicanism as an effective form of government was saved by the American Revolution and the establishment of republican governments in the former British colonies. The United States also demonstrated that it was possible for a republic to cover a large area, something that many, including Rousseau, had doubted. However, many Europeans believed that while republican government might be successful in a country of "virtuous" independent landowners like America, Europe was too "corrupt" and commercial for republicanism.

Republicanism emerged as a dynamic force in Europe during the French Revolution. The revolutionaries not merely overthrew the monarchy and established a republic, they also spread republicanism by force of arms, establishing new republics such as the short-lived Cisalpine and Parthenopean republics in Italy while destroying the Dutch, Genevan, and Venetian republics. The restoration of monarchical government by

➤ JOSEPH MAZZINI'S REPUBLICAN CREED

In exile in England following the failure of the Roman Republic, Mazzini wrote an apologia for the rebellion. Mazzini sought English support but avowed that his own republicanism was more suited for Italy than the liberal monarchical and aristocratic system of Britain.

"I have said that the subject of the following writings is the National Italian Cause. I ought perhaps to have said the Republican Italian Cause. They tend, in fact, to show, by evidence, what the Republican Party has done in Rome, and to explain its conduct elsewhere. For in Italy, the Republican Party and the National party are one and the same thing. . . .

I am by principle a Republican, that is to say, rationally speaking, there are for me but two legitimate masters, God, in heaven, and the People—the country guided by the best among them, upon earth. The system which, instead of seeking to acknowledge power where it really exists, that is to say, wherever God has given the highest amount of genius and of virtue, places it arbitrarily in aristocratic privilege or hereditary royalty, is to me but the materialism of chance substituted to an enlightened choice."

—William E. Burns

Joseph Mazzini, *Royalty and Republicanism in Italy* (London: Charles Gilpin, 1850), iv–vi.

Napoleon Bonaparte (1769–1821), with his proclamation as emperor in 1804 and the replacement of revolutionary France's satellite republics with satellite monarchies ruled by members of Napoleon's family, again marginalized republicanism. A further blow to European republicanism was Napoleon's defeat at Waterloo and the subsequent "Vienna settlement," which restored many of Europe's monarchies but only one of its republics, the Swiss republic, now including Geneva.

At the same time republicanism was marginalized in Europe, however, it was triumphant in the Americas, as the disintegration of the old

Spanish empire led to the formation of numerous republics. Attempts to establish monarchies in postcolonial Latin America, most notably Augustin Iturbide's (1783–1824) proclamation as emperor of Mexico in 1822, were short-lived failures. Iturbide's empire lasted less than a year. The one major exception was Brazil, which separated from Portugal under a prince of the Portuguese royal house as emperor, but even Brazil became a republic in 1889.

In post-Vienna Europe, republicanism was often allied with another revolutionary force, nationalism. One of Europe's leading republicans, Giuseppe Mazzini (1805–1872), was best known as the champion of Italian nationalism, hoping to end foreign domination and unite Italy's numerous states and territories into a republic. The second burst of revolutionary republicanism after the French Revolution was the revolutions of 1848. The overthrow of monarchical authority led to the formation of numerous short-lived republics, such as Mazzini's Roman Republic, formed after chasing the pope out of Rome. However, the reassertion of power by Europe's traditional rulers snuffed out most of these republics. The exception was France, whose Second Republic was overthrown from within by Napoleon's nephew Louis Bonaparte (1808–1873). He established the Second Empire, with himself as emperor, in 1852.

The fulfillment of the Italian and German national agendas in the late nineteenth century did not represent triumphs of republicanism. Italian and German nationalists compromised with traditional rulers for those countries to achieve unity and independence under monarchies, while Hungary, also a country of strong republican nationalism, established national self-determination under the existing Habsburg monarchy. Republicanism remained central to the nationalist agenda for some movements that had not attained their national goals, such as Irish and Polish nationalism, but the great triumph of republicanism was the establishment of the French Third Republic, born out of the defeat of the empire in the Franco-Prussian War. The republic was not born from a surge of republican enthusiasm, however, as monarchism was very strong, and a French king could have been

restored had it not been for difficulties with coming up with a settlement acceptable to the royal claimant. Although established by default, the Third Republic was the longest-lasting regime in post-Revolutionary French history, demonstrating that a large European state could survive and prosper under republican government. But unlike the First and Second French Republics, born of revolution, it inspired no imitators and did not seek to promote republicanism in other countries until after the First World War.

By the end of the nineteenth century, republicanism had spread to China, where there was widespread resentment of the Manchu Qing dynasty. Chinese nationalists like Sun Yatsen (1866–1925) identified republicanism with Western modernity, including industrial development and a public education system to replace the antiquated Confucian academies. The overthrow of the Manchu emperor in 1911 was quickly followed by the proclamation of a Chinese republic rather than a new dynasty, although there would be an abortive attempt to restore the empire in 1915.

Late-nineteenth-century republicanism, like other political ideologies, was frequently defined in racial terms, as whites in settler republics like the United States, the short-lived Confederate States of America, or the Boer Republics of South Africa claimed that nonwhite peoples, incapable of governing themselves, could not be equal citizens in a republic with white men.

Utopian Socialism

Utopian socialist movements, which reached their peak of popularity in the 1830s and 1840s in western Europe and the United States, made important contributions to modern social democratic and communist movements as well as modern feminism. The most popular and influential were the Owenites in England and the Saint-Simonians and the Fourierists in France; all, however, had numerous followers in the United States. Similarly, their message was carried across Europe to Russia and across the Mediterranean to Egypt.

At the end of the 1820s some social and political reformers first used the word “socialist” to distinguish themselves from radical democrats of the French Revolution era. Early socialists criticized the revolution because of its association with violence and terror, a consequence, they maintained, of its encouragement of selfish individualism. Democratic radicals were criticized for focusing too narrowly on such “political” questions as the form of the regime (monarchy vs. republic and who had the right to vote or to govern). In contrast, socialists would create a new social order by better regulating relations between employers and workers and women and men. Their strategy was to create alternative communities where cooperation, rather than self-interest, would prevail and where the absolute rights of private ownership would yield to the “social good,” being either collectively owned or at least subject to public regulation. Moreover, by constructing these alternative communities, utopians would not only create cooperative social structures but also provide a peaceful means for revolutionary change. Merely by observing the utopian life, people would be won over to join with utopians and create more of these alternative communities.

Utopians differed not only from “political” radicals of the revolutionary era but also from feminist writers of the seventeenth and eighteenth centuries and from feminist activists of the revolutionary period who had focused mainly on individual rights of citizenship, including political rights. Utopians thought that these concerns were too individualistic; they

would focus instead on new ways of organizing both production and enduring social networks (e.g., intimacy, sexuality, and reproduction) to ensure sexual equality and sexual liberation.

Charles Fourier (1772–1837) was the first of the utopian socialist feminists. Writing in the first decade of the nineteenth century, he envisioned an ultimate stage of human progress whereby women and men would be equal and equally free and productive. A unique education system would scrupulously treat girls and boys alike. Fourier even demanded that the two sexes dress the same in recognition of the variety of ways that socialization may affect equality. In his utopia women would not be excluded from any social or economic function, “not even from medicine or teaching,” or from his corps of professors, the expected leaders of his community. Fourier proposed the organization of new communities (“phalansteries”) based on associations that would organize production, households, housekeeping, and even sexual experience in new ways. All work would be collectivized. Because Fourier viewed the work of the home, including both the socialization of children and housekeeping tasks, as productive work, it also would be collectivized. He held that isolated households and permanent marriages enslaved both women and men. Love alone should bind couples, and their union should last only so long as their “passionate” attraction joined them.

Although Fourier worked in isolation for most of his life, the utopian socialist movements, whose developments he so significantly shaped, became immensely popular in the 1830s. Their work was mainly propagandistic, and hundreds of people reportedly attended their lectures in cities throughout Europe and the United States. In Paris in the early 1830s Saint-Simonians, followers of the French thinker Henri de St. Simon (1760–1825), lectured daily to hundreds of interested women and men of the working and middle classes. In London at the same time Owenites, followers of the British social reformer Robert Owen (1771–1858), lectured three times a week. Owenite “stipendiary lecturers” and Saint-Simonian “missionaries” fanned out to cities throughout England and France and to other countries as well. Significant numbers

of women were active as speakers, organizers, and directors of the movements' many projects.

Not all of their work was propagandistic, however; utopians did actually establish some alternative communities. Owenites set up 7 such communities in England between 1821 and 1845 and about 15 in the United States. New Harmony in Indiana was probably the most famous U.S. Owenite community. Saint-Simonians established several collective *maisons de famille* ("family houses"), each directed by one male and one female (a "brother" and a "sister"), in Paris in the early 1830s, and those who lived together pooled their financial resources. Meals were collectively prepared and served for an even larger group of adherents. Associationists (as the followers of Fourier began calling themselves in the late 1830s) set up a community in France in Guise (construction began in 1859), and also set up over 30 such communities in the United States between 1840 and 1860. Brook Farm in Massachusetts was probably the most famous U.S. Associationist community.

Most communities were short-lived, however. Beginning in the 1850s, the utopian strategy gave way to more "scientific" forms of socialism that emphasized class struggle and the ultimate victory of the proletariat. Voices proclaiming concern for both workers' emancipation and women's emancipation were nearly drowned out. That class struggle and sex struggle were once united in utopian socialism was nearly forgotten. In the 1830s and 1840s, however, utopian socialists envisioned the transformation of all aspects of social life, not just economic and political relations. For them, a new relationship between women and men figured as prominently as a new relationship between workers and capitalists.

Marxism

The term "Marxism" refers to both the philosophical and economic theories developed in the writings of Karl Marx (1818–1883) and Friedrich Engels (1820–1895) and the underlying ideology of socialist political parties from the late nineteenth century to the present. In *The Communist Manifesto* (1848) and *Capital* (1867), Marx presented a critique of the dominant bourgeoisie—members of the middle class who controlled the means of production—and the capitalist economic system that afforded them power through the exploitation of the proletariat, or laboring poor. Marx combined a unique theory of history—historical materialism—with wide-ranging economic and sociological research to postulate a utopian communist society that would succeed the bourgeois, capitalist order of the mid-nineteenth century. The proletariat would implement this change through violent revolution and would benefit from the ousting of their bourgeois masters. In industrialized nations of Europe and the United States, Marxism served as a major ideological underpinning for prolabor socialist political parties and trade unions.

Marx, born in the German city of Trier, attended the University of Berlin in the late 1830s and while there was shaped by an intellectual debate concerning the dialectical theory of history described by the recently deceased German philosopher G. W. F. Hegel. Like other Left Hegelians, Marx admired the progressive dialectical theory but found Hegel's formulation overly idealist and detached from lived experience. Thus, Marx applied praxis (practical experience) in the form of social scientific research to the dialectical method in his theory of history. This

historical method was influenced by humanist philosophy, utopian socialist politics (although Marx also had misgivings regarding the lack of praxis among utopian socialists), and a profound distaste for the dominant European socioeconomic order of his time. The resulting philosophy suggested a new world order in which the ultracompetitive atomized society of the capitalist system would be surpassed by a socially harmonious communist utopia.

To understand the situation of the modern worker, Marx turned to history. For him, all history was the history of class struggle. According to Marx, during the French Revolution the mistreated bourgeoisie rose against the oppressive monarchical political order and feudal economic order to abolish the inequality of the established systems. Once the bourgeoisie were in power, they seized the means of production and governed according to their capitalist mode of production. The bourgeois order was based on property, speculation, and labor exploitation. Correspondingly, Marx suggested that it was now the working class that would rise to destroy the unequal system that served the interests of the bourgeoisie. Competition, private property, and classes would no longer exist once the workers seized the means of production, and Marx's communist utopia would be realized. Late in his life, Marx theorized a socialist "dictatorship of the proletariat" as the penultimate stage of human history. This dictatorship would guide the transition between capitalism and communism, when state power would no longer exist.

As with previous utopian socialists, Marx deplored the condition of the worker within the capitalist system. The capitalist goals of profit and economic growth placed a premium on the production of commodities, devaluing and alienating the worker. In the capitalist system, argued Marx, inanimate objects were assigned more value than the workers who created them. Workers no longer possessed an intrinsic value but instead became a means to an end: the production of commodities. The worker was further alienated due to the division of labor. Whereas an ancient farmer or a preindustrial craftsman was able to develop a product from start to finish, the capitalist division of labor assigned each

Karl Marx was more than an important figure in nineteenth-century Europe. His status as the founder of modern communism has placed him among the most influential people in the history of the modern world. (Library of Congress)

worker a menial task, destroying the worker's creativity and sense of self-worth. On the contrary, according to Marx's labor theory of value, products only had value equal to the labor expended to create them. The bourgeois-capitalist order alienated the proletariat, who could wrest power from the entrenched ruling classes only through violent revolution. The working class had nothing to lose and everything to gain by seizing the means of production and ousting the exploitative capitalist system.

Marx's economic theories represent a critique of classical political economists such as Adam Smith and David Ricardo, whose ideas provided the theoretical underpinnings of capitalism. The classical economists considered capitalism a beneficent economic system, arguing that a laissez-faire approach to the economy would ensure economic growth and benefit society as a whole, while a division of labor would allow for increased production and profit. Marx

➤ “WORKING MEN OF ALL COUNTRIES, UNITE!”

Marx and Engels end *The Communist Manifesto* with this call to arms. It is thus apparent that the *Manifesto* was not only a philosophical and economic critique of capitalism but also a political program. The work was commissioned by the politically active Communist League in 1847 and was published at the moment of the 1848 revolutions across Europe, which pursued both socio-economic and national aims. This famous quote also provides insight into Marx’s understanding of class consciousness. As argued in *The Communist Manifesto*, “the working men have no country” because the proletariat, regardless of nationality, shares in the experience of exploitation. Like religion, which was famously dismissed as “the opium of the people” in the 1843 *Critique of Hegel’s Philosophy of Right*, nationalism obscures the true interests of the working class and serves to divide the “universal class” on the basis of relatively trivial linguistic and cultural differences. Thus, Marxism proffers an internationalist vision of a communist utopia that will abandon the divisions of nation and state as relics of the bourgeois/capitalist order. Committed Marxists attempted to realize this postnational vision of Marxism through the formation of the First International (1864–1876) and the Second International (1889–1916) as organizations to guide the development of international socialism.

—Andrew Denning

countered that the abstract nature of market capitalism and the greed inherent in the capitalist system destroyed social relationships, leading to an atomized society rife with class antagonisms.

Marx’s theories applied only to societies that had undergone industrialization. According to Marx’s understanding of history as a progression of stages, the workers could seize control of the means of production only in an industrialized nation. Thus, before 1914 Marxism was most prominent among socialist political parties and trade unionists in Europe and the United States, notably from the early 1870s through the beginning of World War I.

The reception of Marx’s ideas was muted in the aftermath of the failed 1848 revolutions across Europe that ushered in two decades of

conservative retrenchment. By 1870, however, increasing urbanization and industrialization, especially in Western Europe, allowed socialists to tap into a large segment of the population alienated by their governments’ increasingly antilabor policies. The 1871 Paris Commune set up a short-lived communist society that would be studied intently by subsequent Marxists such as Vladimir Lenin and Mao Zedong. The German Social Democratic Party (SPD) gained steadily in popularity from the 1870s until 1912, when Social Democrats held a plurality of seats in the parliament. In the United States, socialist candidate Eugene V. Debs ran for president in every election between 1900 and 1912. Socialists of this era were plagued by internal dissent, however, as the parties split ideologically over whether to follow Marx’s call for revolutionary action or, alternately, to institute reforms within the existing system. In Germany the intense debates around the turn of the century between revolutionary Rosa Luxemburg and reformer Eduard Bernstein shows that the socialists of this era, while popular at the voting booth, were not united behind a coherent Marxist ideology.

Socialist Revisionism

The term *revisionism* refers to the first of the efforts to transform the original Marxian framework. The intention was to bring that theory into accord with evidence about advanced capitalist nations, evidence that had accumulated by the end of the nineteenth century. This effort occurred within the German Social Democratic Party (SPD), which was the world’s largest socialist party as measured in terms of members, size of organization, number of voters, and share of the electorate. Marx and Engels had given much attention to that party, seeing it as the principal agency for their political practice.

With considerable income from membership dues, the party was able to support many newspapers and journals and that, in turn, meant it had a large “staff” of intellectuals. The combination of organization and intellectuals gave the SPD a unique position among the world’s socialist parties. The SPD was dominant within the Second International. The other socialist parties looked to the Germans for guidance.

The leading figure in the revisionist struggle was Eduard Bernstein, a friend and coworker of Engels. At one time a member of the party’s left wing, he later changed position, the revisionist argument being basically moderate or reformist. The original English translation of his major work was given the title *Evolutionary Socialism*. The argument was still heavily focused on class and class dynamics. In contrast to the original, however, a different nomenclature and a different set of classes were indicated. The predictions about the growth, decline, and transformation of the classes were much changed. And the predictions about class-specific outlooks were significantly altered. The most important of these was the claim of a dwindling revolutionary potential within the working class.

The Social Democratic presence within Germany had major implications for German scholarship, particularly for the social sciences and history. Many German academics were forced to confront the issues raised by socialist intellectuals. The subject of class, accordingly, occupied a central place in German scholarship, and capitalism also became a major theme. The work of Werner Sombart, Max Weber, and Theodor Geiger provide the most obvious examples.

Some important elements of the revisionist critique:

1. Petty bourgeois persistence: In opposition to the Marxian expectation that the small firms, the artisans, producers, and proprietors, would be driven out by competition with more efficient giant firms (the ex-proprietors then being forced into the proletariat), Bernstein showed this class continuing to have a significant numerical presence at the turn of the century.

2. Growth of the salariat: Drawing on census data, the revisionists pointed to the rapid growth of the salaried white-collar employees. Those people were not owners, hence were

not part of the bourgeoisie. They were different from the proletariat in that, typically, they had better pay, greater job security, and greater chances for advancement. All of these differences of social condition, it was thought, would lead them to differ also in their politics. They would hold moderate or centrist political views. This new class has generally been referred to as the “new middle class.”

3. Relative decline of the proletariat: Given the stability of the old-middle-class segments and the growth of the new or salaried middle class, it followed that the working class would experience a relative decline. Contrary to a central Marx-Engels prediction, the proletariat was not growing. It would not become the “immense majority.”

4. Growing affluence: The advanced capitalist societies were becoming richer. Real living standards were increasing. This brought an important transformation within the working class; by the turn of the century, the signs were unmistakable. The development was most obvious among the skilled workers. They were able to adopt a middle-class living standard. The argument, put simply, was that those “affluent” workers would adopt reformist or centrist outlooks.

5. Social mobility: The basic Marxian prediction was one of downward mobility. The lower middle class would lose out; its members would “fall into the proletariat.” The revisionist argument challenged that claim. The persistence of the two old-middle-class segments and the growth of the new middle class meant a change in direction; more people would move up into the middle class than down into the working class.

Three general developments, the persistence of the old middle class, the growth of the new middle class, and the appearance of affluent workers, stood in the way of direct revolutionary confrontation. The principal conclusion, a prescriptive judgment, followed from these empirical findings: It was the need for a reformist policy. The revisionist arguments were addressed to Europe’s socialist parties, beginning with the German Social Democrats. The majority of voters in modern societies, so it was argued, were destined to be reformist in outlook. To gain the votes of that majority, of the working-class

and new-middle-class moderates, socialist parties would have to develop reformist programs.

To appreciate the importance of the revisionist critique, one must know something of the context. The Social Democrats first officially adopted a Marxist program in 1891 at the Erfurt Congress.

The statement opens with a claim about the development of bourgeois society leading with natural necessity to the destruction of small firms. The means of production, it stated, would increasingly be monopolized by capitalists and large landholders. The proletarian numbers would be ever larger, all of this leading to a sharp opposition of exploiters and exploited. Those pages, the “theoretical” statement, were written by Karl Kautsky, the party’s leading theorist and defender of “orthodox” Marxism. The subsequent revisionism, in effect, declared that the party, its leaders, intellectuals, and the approving party congress, were mistaken on all major points. The party dealt with the challenge politically. Revisionism was rejected, by overwhelming majorities, in subsequent party congresses.

Bernstein’s claims, on the whole, are better supported than the Marxist originals. The man, in short, made an important, serious contribution to the understanding of nineteenth- and twentieth-century social developments. Nevertheless, Bernstein is, curiously, treated rather deprecatingly in the literature. That is, perhaps, understandable in the heavily partisan literature of the left. But a similar tendency, somewhat more restrained, is found in scholarly sources.

Anarchism

The basic tenet of anarchism is that people flourish best without imposed authority and external coercion. As a social philosophy and a way of life, anarchism may be traced back to the Daoists in ancient China. As a coherent political ideology, however, anarchism first emerged in late-eighteenth-century Europe. It developed primarily in opposition to centralized states and industrial capitalism and by the end of the nineteenth century was a mass revolutionary movement attracting millions of adherents.

Nineteenth-century anarchism has been described as a creative synthesis of its ideological cousins and political rivals, liberalism and socialism, and there is some truth in this claim. Like nineteenth-century liberals such as John Stuart Mill (1806–1863), anarchists emphasized the value of individual liberty and advocated freedom of thought, expression, tastes, pursuits, and association. Like nineteenth-century socialists, most anarchists emphasized the values of social equality and social solidarity and embraced the vision of a postcapitalist society. What chiefly distinguishes anarchism from both liberalism and socialism is its total rejection of the state, either as a feature of a free society or as a means to achieving that end. Indeed, unlike Marx and his followers in the nineteenth and twentieth centuries, most anarchists consistently emphasized that means cannot be separated from ends and rejected the idea of a dictatorship of the proletariat as a prelude to a stateless society.

Like liberalism and socialism, anarchism is a highly diverse political ideology, encompassing a number of different currents of thought. In the nineteenth century, four were particularly

THE KILLING OF A PRESIDENT

On September 6, 1901, the self-professed anarchist Leon Czolgosz shot President William McKinley at the Pan American Exhibition in Buffalo, New York; the president died eight days later. The assassination helped launch the progressive era in U.S. politics by catapulting Theodore Roosevelt to the presidency. It was also a key event in the era of anarchist terrorism, 1880–1914, when anarchists set off many bombs, killing innocent bystanders and taking aim at monarchs, presidents, prime ministers, and other government officials with unprecedented intensity and success. Many anarchists rejected terrorism as inimical to anarchism's goal of social justice, while others saw it as the most effective weapon to fight against repressive governments. In the popular mind, however, terrorism and anarchism were synonymous.

Born in Detroit, Michigan (not in Alpena, Michigan, as was once thought), in 1873 to Polish immigrant parents, Czolgosz considered McKinley an agent of imperialism in the Philippines and a

pawn of wealthy businessmen who exploited American workers. Although not a member of any anarchist organization, the reclusive Czolgosz spent hours reading both mainstream and anarchist newspapers that recounted the deeds of European assassins. On September 6, 1901, he sought to follow in their footsteps.

The assault on McKinley signaled a new phase in anarchist terrorism, which was now becoming a global phenomenon. The German and Russian governments called for an international antianarchist agreement, but the United States refused to join. McKinley's assassination also led to greater safeguards for the president, with the Secret Service made legally responsible for his protection. New York, New Jersey, and Wisconsin passed antianarchist laws, and in 1903 Congress banned anarchists from entering the United States. After McKinley's death, the antianarchist backlash frightened and demoralized many anarchists in America. Anarchist terrorism did not resume until 1908.

—Richard Bach Jensen

significant: individualism, mutualism, collectivism, and communism. While the adherents of all these schools rejected hierarchical and compulsory forms of authority such as laws, churches, and states, they had different views about the socioeconomic arrangements that would characterize a free society. Individualist anarchists such as Max Stirner (1806–1856) in Germany and Benjamin Tucker (1854–1939) in the United States defended the primacy of individual sovereignty and conceived social relationships primarily in terms of nonbinding contracts between self-interested individuals. Mutualist anarchists such as Pierre-Joseph Proudhon (1809–1865) in France, who was also the first known thinker to refer to himself as an anarchist, endeavored to synthesize the institutions of private property and collective ownership in a way that would avoid the drawbacks of both. Collectivists such as the Russian-born Michael Bakunin (1814–1876) combined Proudhonian politics and Marxian economics in a revolutionary program in which the means of production were to be owned in common by labor groups and free communes. Whereas

collectivist anarchists generally assumed that reward would be proportional to labor, anarchist communists such as Peter Kropotkin (1842–1921) and Errico Malatesta (1853–1932) envisaged stateless societies in which each person would make use of common resources according to need. According to Kropotkin, harmony in such a society would be achieved not by submission to law or obedience to any authority but by free agreements concluded between territorial and professional groups freely constituted for the sake of production and consumption as well as the satisfaction of the infinite variety of needs and aspirations of a civilized being.

Contrary to popular belief, anarchism is much more than an ideal. Current anthropological research confirms that the state is a recent development in human history and that for at least 40,000 years people have organized themselves without government and law in peaceful and productive ways. In the modern world, the most conspicuous example of anarchism in practice unfolded in Spain. For 70 years, from the 1860s to the 1930s, Spanish anarchism developed

into a viable alternative to the state. While the experiment was ultimately brutally cut short by the combined forces of fascism and communism, anarchism remains a living ideology at the dawn of the twenty-first century. It experienced a resurgence in the social movements and counterculture of the 1960s and has exercised a profound influence on such diverse contemporary movements as ecologism, pacifism, and feminism. Anarchism thrives today in the decentralized networks of the alternative globalization movement as well as in countless experiments in collective living, alternative media and art, and cooperative production and distribution.

The Changing Face of Nationalism, 1870–1914

Nationalism in the late nineteenth and early twentieth centuries changed from a strong positive attachment toward one's own political nation or ethnic group to a much more exclusionary feeling of political or ethnic solidarity. The period before 1870 was an age of nation building and nationalist feeling that included possibilities of civic (political) and ethnic (cultural) nationalism. However, the rise of social Darwinism coupled with new economic and political challenges led to the prevalence of ethnic-based and exclusionary nationalism from 1870 to 1914. Ethnic nationalism was frequently used in conjunction with earlier support for nationalism and nation building before World War I.

As stated above, the rise of social Darwinism contributed to the changing nature in nationalism from 1870 to 1914. Social Darwinism suggested that human survival was based on a sociocultural biological struggle among peoples and therefore justified international and domestic strife. In domestic affairs, minorities became more widely discriminated against throughout Europe. Mass media, especially popular journals,

in France, Germany, and Russia propagandized against Jews. A prime example is the Dreyfus Affair in the 1890s in which Alfred Dreyfus, the first Jewish military officer to serve in the French General Staff, was falsely accused and convicted of selling secret documents to the German government. Dreyfus was not fully exonerated until 1906, and the Dreyfus Affair deeply divided the French public, as supporters of the army, royalists, and anti-Semites were pitted against republicans and socialists. Likewise in Germany socialists, Catholics, Jews, Poles, and other minorities were repeatedly discriminated against by the government and attacked in the media for their supposed lack of Germanness.

New economic and political challenges also led to fierce competition among European nation-states. Following the Franco-Prussian War of 1870–1871, German military and political leaders declared the founding of a new German empire in the Hall of Mirrors at Versailles on January 18, 1871. This embittered the French, who considered Versailles an important symbol of France's national identity, and thus severely hampered future French-German relations. In addition, Europeans responded to industrial progress in the late nineteenth century by competing against one another for the acquisition of

Suspected French Army spy Alfred Dreyfus is condemned to prison during a secret military trial in 1894. The controversy over his conviction turned the Dreyfus Affair into a cause célèbre at the turn of the twentieth century, firmly dividing liberals and conservatives in French politics. (Library of Congress)

new markets and raw materials. Inspired by the precepts of social Darwinism and what they promoted as their own superior civilization, European nations engaged in a struggle for territories in Africa and Asia. In fact, latecomers to the imperialist enterprise such as Germany demanded their own colonial spoils, and all of the great European powers equated overseas empires with national greatness.

Social Darwinism and contemporary political and economic affairs transformed the way that many Europeans viewed nationalism. Nations that had been founded during the initial growth of nationalism before the nineteenth century, especially France and Great Britain, did retain some form of civic nationalism, which constituted a strong allegiance to a political boundary and included fairly liberal political and civil rights. Nevertheless, France and Great Britain increasingly discriminated against minorities and featured some troubling exclusionary tendencies. More recently founded European nation-states such as Germany developed a much more ethnic-based nationalism in the late nineteenth and early twentieth centuries. Ethnic nationalism was based on a powerful emotion toward a particular race or ethnic group, placed a far greater emphasis on common cultural values than on liberal democracy, and consisted of a more exclusivist type of nationalism than that of civic nationalism.

Ethnic nationalism was often utilized by advocates of nation building to achieve their objectives. Ethnic minorities in Austria-Hungary, disgruntled by their treatment under the rule of the German Habsburg dynasty, advocated equal rights or more often sought national independence. Many of these minorities, such as Czechs, Croats, Serbs, and Slovenes, formed national movements and often resorted to political violence in hopes of breaking away from Habsburg rule and creating their own nation-states. One such nationalist, Gavrilo Princip, a 19-year-old Bosnian Serb, assassinated the heir to the Austrian throne, Archduke Franz Ferdinand,

➤ GERMAN CATHOLIC CENTER PARTY

The German Catholic Center Party played a crucial role in German politics and national identity from 1870 to 1914. The Center Party was formed in December 1870 to represent the large German Catholic minority, most of whom lived in southern Germany and suddenly found themselves living in a largely Protestant state after the unification of Germany in 1871. The party program called for local autonomy, the protection of Catholic schools, and the establishment of civil rights for all German minorities, not only Catholics. In 1872 German chancellor Otto von Bismarck launched the *Kulturkampf* (cultural struggle), a government campaign that abolished Catholic schools, placed Catholic seminaries under state control, gave the federal government the power to dismiss clergy, and outlawed the Jesuits. Moreover, Bismarck labeled German Catholics “enemies of the state,” accusing them of being loyal to the pope rather than the German state. Although the *Kulturkampf* was largely revoked in 1878, Bismarck’s discriminatory policies solidified the Center Party as a national minority.

■ Introduction: Political Developments in the Americas to 1914

From 1750 to 1914, an era of deep and pervasive political change, no part of the world experienced greater political transformations than the Americas. In 1750 this vast region was controlled by a handful of European states, including Spain, Portugal, Great Britain, France, and the Netherlands (which controlled Dutch Guyana, a tiny colony on South America's Caribbean coast). North America's European inhabitants were still concentrated on the Atlantic coast, with most of the rest of the continent populated by Native American tribes that were self-governing, even though they lived on territory claimed by France, Britain, or Spain. Although colonial legislatures existed in Britain's Thirteen Colonies and exercised some authority over local issues, throughout Latin America and areas of European settlement in North America, vital decisions affecting taxes and economic policy all were made in European capitals and carried out by governors and other officials appointed by European kings.

In contrast, by the early 1900s, North and South America consisted of 17 sovereign states that varied in size from giants such as Brazil, Canada, and the United States, which together made up almost 65 percent of North and South American territory, to tiny states such as the 7 states of Central America, which were crowded into the small land bridge linking Mexico and Colombia between the Caribbean Sea and the Pacific Ocean.

The political experiences of the new American states had some similarities but also differed in many respects. Independence was won in colonial Latin America and Britain's Thirteen Colonies through rebellion and war, but in Canada, where the rebellions of 1837–1838 involved small numbers and were easily suppressed, it was achieved by legislation and compromise. After independence the new states adopted republican constitutions except Brazil, which had an emperor until 1889, and Canada, whose citizens technically remained subjects of the British Crown even after achieving self-government in 1840. In Canada and the United States democracy flourished, but in Latin America republican government meant

rule by a small elite of white planters, mine owners, merchants, and army officers whose interests also were served by the military strongmen (*caudillos*) who frequently seized power.

Canada and the United States expanded across the North American continent to become the two largest states in the Americas, while other nations shrunk. Mexico lost half its territory to the United States after the Mexican-American War of 1846–1848, while Paraguay lost 55,000 square miles (142,500 square kilometers) of territory to Brazil and Argentina after the War of the Triple Alliance (1864–1870). Large nations such as Canada, Mexico, Brazil, and the United States all faced the challenge of reconciling the powers of central governments with those of states, provinces, and regions. Secessionist movements challenged Canada and caused the American Civil War, the bloodiest war in the nation's history. Canadian and U.S. expansion, along with policies adopted by Argentina and Chile in the 1860s, meant territorial losses for the indigenous populations and frequently relocation and resettlement to reservations where their traditional cultures withered away. While only a few American nations expanded territorially, virtually all experienced growth in population, spurred in many cases by immigration. Canada and the United States attracted a steady stream of immigrants throughout the nineteenth century, with most coming from Britain and Germany. They, along with the rest of the region, received a flood of immigrants from the 1880s onward, with the arrival of millions of new immigrants from Italy, eastern Europe, and parts of Asia.

Many American nations experienced racial and ethnic tensions. In Canada, French-speaking Quebec never totally reconciled itself to being part of largely Anglophone Canada, and friction between the Ottawa-based government and Métis (people of mixed Indian and French-Canadian descent) caused disputes and conflict as the nation spread west in the 1870s and 1880s. Slavery was gradually outlawed in the hemisphere and ended completely after Cuba abolished it in 1886 and Brazil did so in 1888.

How to integrate former slaves into society proved a great challenge, however, especially in the United States, where ex-slaves were denied political rights and subjected to discrimination in many forms. Throughout Latin America, the spread of pseudo-scientific racial theories in the nineteenth century strengthened the conviction of pure-blood whites of their fitness to rule and created new obstacles for social advancement among blacks, Indians, mestizos, and mulattos.

Political leaders also had to make decisions about their nations' economic futures. Tariff policies were hotly debated. In the United States, tariffs on imported manufactured goods were raised during the American Civil War and never went down appreciably in the following decades despite the stated commitment of the Democratic Party to lowering them. In this and other ways the government subsidized American businesses but did little to regulate them. Canada also adopted a program of high tariffs on imported manufactured goods beginning in 1879, along with a program of public subsidies for building a transcontinental railroad. In contrast, throughout most of Latin America governments favored free trade to keep down the costs of imported European manufactured goods and encourage the export of the region's metals, hides, fertilizers, and agricultural products. Such policies encouraged economic growth and helped integrate Latin America into the international economy but discouraged the development of manufacturing. The region would pay the price for such policies during the economic turbulence of the twentieth century.

—*James H. Overfield*

U.S. Territorial Expansion

In the decades following its War of Independence, the United States underwent rapid territorial expansion. The Treaty of Paris (1783) awarded the new nation immense territory, much of it west of the Appalachian Mountains. By the mid-nineteenth century, the country extended from the Gulf of Mexico and the Rio Grande in the south to the Great Lakes and the 49th parallel in the north. The Alaska Purchase in 1867 rounded out America's continental scope. The active pursuit of territory reflected

the country's evolving economic interests and geopolitical concerns. Land was acquired through various methods that dislodged European powers from the continent and displaced Native Americans from their lands.

In order to expand west after the Revolution, American policy sought entitlement to all Indian lands between the Appalachians and the Mississippi River. U.S. citizens began to settle the Ohio River and Tennessee River valleys in the 1780s. The government issued the Northwest Ordinances, which laid out the process for the sale and settlement of these lands, marking a concerted effort to expand inland. At first, U.S. officials negotiated land cession treaties with the Indians very heavy-handedly. Mounting Indian resistance in the late 1780s, however, forced a policy shift to purchasing lands instead. By 1811 these piece-by-piece initiatives secured a considerable part of the Old Northwest and pushed the Indians farther west of the Mississippi River.

The Mississippi River was an increasingly important waterway for commerce as settlements grew. Access to the mouth of the river at New Orleans became crucial, and after several unsuccessful attempts to purchase New Orleans

SEWARD'S ICE BOX

Manifest Destiny was a powerful idea among supporters of American territorial expansion during the mid-nineteenth century. However, America's expansionary impulse waned in the 1860s as it became embroiled in the Civil War. The federal government made one more major land purchase after the war, acquiring Alaska where American and Russian commercial interests had coexisted since the 1790s but with increasing conflict. Russia recognized the difficulties in retaining the area against an expanding United States and sold reluctantly in 1867 for \$7.2 million. Many Americans who viewed the purchase as a prodigious purchase for useless land quickly dubbed Alaska "Seward's Icebox" after Secretary of State William H. Seward, who pursued the deal. Opposition was quelled in the 1890s when the Klondike gold rush drew new people and resources to this final American frontier.

—*Helen Bao*

from the French, U.S. officials seized the opportunity in 1803 when Napoleon offered to sell the entire Louisiana Territory. Under the administration of President Thomas Jefferson, Robert Livingston and James Monroe negotiated a total purchase price of \$15 million for 827,000 square miles (2,141,920 square kilometers) of land, approximately 3.5 cents per acre. The Louisiana Purchase more than doubled American territory and established an expansive frontier that

captured the American imagination. It also strengthened the young republic both in its self-perception and its status as a sovereign nation.

The boundary between the new Louisiana Territory and Spanish lands in both Texas and Florida quickly led to disputes. The United States always coveted Florida for its navigation routes in the Gulf of Mexico and to prevent its use as a military launch base against the United States by foreign powers. Florida was subject to frequent

hostile incursions by private American citizens in the early nineteenth century to force the president's hand to annex the region and to demonstrate, as elsewhere, that the United States could ultimately seize the territory if it desired. In 1819, taking advantage of a weakened Spain, the United States acquired all of Florida through the Adams-Onís Treaty. In it Spain relinquished all land claims north of the 42nd parallel, while the United States ceded its claims to Texas west of the Sabine River.

The American drive for Texas as well as the California coast, however, did not subside. In 1836 Texas petitioned to join the United States after it successfully revolted against Mexico. Opposition to admitting Texas as a slave state stalled annexation for nearly a decade. The annexation of Texas contributed to the Mexican-American War, which broke out in 1846. The Treaty of Guadalupe Hidalgo, signed two years later at the end of the war, marked the largest U.S. territorial gain in its history. The United States compensated Mexico \$15 million for nearly 1 million square miles (2.6 million square kilometers) of land in what became California, New Mexico, Nevada, and Arizona. Meanwhile, thousands of Americans went west to Oregon Country in the 1840s, a territory jointly held by the United States and Great Britain since 1827. Both sides fought hard to claim it, particularly for the major harbor at Puget Sound. After extensive negotiations, the two sides signed the Oregon Treaty in June 1846 that extended the existing 49th parallel boundary in the northeast all the way to the Pacific Coast.

After the purchase of Alaska from Russia in 1867, America entered the twentieth century as a continental nation with tremendous territorial reach. The contours of an empire emerged that foreshadowed expansion beyond North America. At the same time, memories of a lopsided victory in the Mexican-American War, sentimental accounts of the vanishing American Indian, and embitterment from the Civil War left many Americans feeling uneasy about how the nation was forged. These experiences in territorial expansion contributed to a burgeoning national identity to be further shaped in the years to come.

Sectional Conflict and the Origins of the Civil War

Sectional conflict over slavery between the northern and southern United States led to the Civil War. The abolition of slavery in the North in the eighteenth century and the perpetuation of bondage in the South divided these regions into separate societies. Exacerbating this division were differences in the economy, with the North moving in the nineteenth century toward manufacturing and the South retaining an emphasis on agriculture.

As in much of the world, slavery arose in the American colonies as a way of securing workers in an era of scarce labor and too little money to attract what labor there was. Although slavery

Map illustrating the Missouri Compromise of 1820. Under terms hammered out by Congress, Missouri entered the Union as a slave state, while Maine entered as a free state. Slavery was banned in the remainder of the territory north of the southern border of Missouri. (North Wind Picture Archives)

➤ A CALL FOR JUSTICE FOR THE SOUTH

In March 1850, at the height of the debate about slavery in the territories recently won from Mexico, the South Carolina senator John Calhoun appealed to the North for justice in a speech delivered to the Senate.

“Having now shown what cannot save the Union, I return to the question with which I commenced, How can the Union be saved? There is but one way by which it can with any certainty; and that is, by a full and final settlement, on the principle of justice of all the questions at issue between the two sections. The South asks for justice, simple justice, and less she not ought to take. . . .

But can this be done? Yes, easily; not by the weaker party, for it can of itself do nothing—not even protect itself—but by the stronger. The North has only to will it to accomplish it . . . to cease the agitation of the slave question, and to provide for the insertion of a provision in the Constitution, by an amendment, which will restore to the South, in substance, the power she possessed of protecting herself before the equilibrium between the sections was destroyed by the action of the Government. . . .

If you, who represent the stronger portion, cannot agree to settle them on the broad principle of justice and duty, say so; and let the States we both represent agree to separate and part in peace. If you are unwilling we should part in peace, tell us so; and we shall know what to do, when you reduce the question to submission or resistance.”

John C. Calhoun, “On the Slavery Question, delivered in the Senate, March 4, 1850,” in *The Works of John C. Calhoun*, Vol. 4, ed. Richard K. Crallé (New York: D. Appleton and Co., 1888), 571–573.

was legal in all 13 colonies, it took hold chiefly in the South where plantation slaves shouldered the burden of growing cash crops for export. In the North slavery had sunk only shallow roots, and after the American Revolution the northern states abolished it. The perpetuation of the United States as two societies, one slave and

the other free, might not have threatened the Union but for the nation’s westward expansion. The Louisiana Purchase (1803) and the Treaty of Guadalupe-Hidalgo following the Mexican War (1846–1848) gave the United States vast expanses of land west of the Mississippi River. As Americans settled these territories and organized them for admission to the Union, the question was whether these states should allow slavery. The admission of Louisiana, the first state west of the Mississippi River, had in 1812 posed no problem. Its geography led no one to dispute Louisiana’s status as a slave state.

Missouri, however, was another matter. In the center of the United States rather than squarely in the North or South, Missouri was not easy to categorize as slave or free. It bordered both Illinois, a free state, and the slave states Kentucky and Tennessee. Moreover, Missouri had some 10,000 slaves in 1819, the year it petitioned to join the Union as a slave state. The United States then had 11 slave states and 11 free states; Missouri’s admission as a slave state would tip the balance of states and the Senate toward slavery’s supporters. To prevent this, New York congressman James Tallmadge Jr. proposed an amendment to the Missouri statehood bill requiring that the new state import no more slaves and gradually abolish slavery altogether. The amendment was defeated. In 1820 Maine applied for statehood, giving Speaker of the House Henry Clay of Kentucky an opportunity to push through a series of measures that came to be known as the Missouri Compromise. Maine as a free state and Missouri as a slave state were to be admitted to the Union together, thus preserving the balance in the Senate between proslave and antislave states. In addition, the Missouri Enabling Act of 1820 prohibited the creation of new slave states north of latitude 36°30’, and in this form the Missouri Compromise quieted sectionalism.

The Mexican War, however, renewed sectionalism by adding to the United States land not subject to the Missouri Compromise. In 1846 Pennsylvania congressman David Wilmot urged Congress to ban slavery from any land the United States took from Mexico. Others favored an extension of the southern border of Missouri to the Pacific, with land south of the line slave and land

to the north free. Still others believed that the new territories themselves rather than Congress should decide whether they wished to be slave or free. The issue of slavery unresolved, California in 1849 heightened sectionalism by seeking admission as a free state. Congress obliged in 1850 but in an attempt to forge a broad compromise yielded to southern demands that Congress not prohibit slavery elsewhere in the land taken from Mexico. Although Congress banned the slave trade in the District of Columbia, it left intact slavery and, in deference to slave owners, passed a new law obliging Northerners to return fugitive slaves to their masters.

This Compromise of 1850 did not end sectionalism. In 1855 Kansas degenerated into civil war between proslavery and antislavery partisans. In 1856 South Carolina congressman and slavery advocate Preston Brooks beat unconscious Massachusetts senator and abolitionist Charles Sumner, and in 1857 the U.S. Supreme Court ruled in *Dred Scott v. Sanford* that Congress and the states could not abridge the right of slave owners to hold property, including slaves. Moreover, the Court ruled that the Constitution conferred no rights on blacks. The Republican Party opposed the expansion of slavery into the North, which the *Dred Scott* decision seemed to imply, and in 1860 its candidate Abraham Lincoln won the presidency. Fearful that Lincoln intended to abolish slavery, 11 states in the South seceded from the Union in 1860 and 1861.

The crisis of secession sparked the Civil War. At first Lincoln and Congress did not intend to abolish slavery. They fought only to return the seceding states to the Union and to restrict slavery to the South. The duration and ferocity of the war, however, moved Lincoln to enlarge it into a crusade to end slavery, and in 1862 he issued the Emancipation Proclamation, freeing on January 1, 1863, all slaves in states that continued to fight the Union. The Union victory in 1865 marked the triumph of abolition. That year Congress passed and the states ratified the Thirteenth Amendment, ending slavery in the United States. In the short term the Civil War ended sectionalism. In 1877 President Rutherford B. Hayes withdrew the Union army from the South, allowing white Southerners to strip blacks of their rights without interference from the North. The

Civil War thus failed in the long term to end the racism that slavery had engendered.

Political Ramifications of the American Civil War

From 1865 to the 1890s, American politics were dominated by Reconstruction as well as concerns related to the rise of corporations and the growth of industry and commercialism. Reconstruction, or the great variety of policies designed to reimpose civil order, reunite the North and South, and address the issues related to the end of slavery, first began during the Civil War in 1863, when the North created a Southern stronghold in Louisiana. Reconstruction as federal policy throughout the defeated Southern states went into force at the end of the Civil War and ended with the Bargain of 1877, when the North agreed to remove troops from the South and allow the Southern states to return to home rule.

Throughout Reconstruction, Americans debated its purpose: to reunite the country or to emancipate and protect African Americans. In January 1865 General William T. Sherman had issued Special Field Order 15, confiscating Southern planters' lands in South Carolina and Georgia to provide what has since been termed "forty acres and a mule" to 40,000 freed slaves. This radical move was quickly reversed. Lincoln was assassinated that spring, and by the summer interim President Andrew Johnson pursued a much more moderate version of Reconstruction that restored property (excluding slaves) to Southern whites who took an oath of allegiance to the federal government. Special Field Order

15 was rescinded. At the same time, Southern state legislatures were passing Black Codes that severely limited the freed slaves' citizenship: permitting freedmen to marry and own property but not to vote, testify against whites in court, or serve on juries or in militias.

As the repressiveness of the Black Codes became clear, Radical Republicans (who had earlier pressed for the abolition of slavery) began to joust with President Johnson over his mild policies that favored states' rights over human rights. In 1867 the Radical Republicans gained the upper hand. While the 1867 Reconstruction Act did not redistribute land, the act divided the South into five military zones, disenfranchised thousands of former Confederate loyalists, and forced the Southern states to ratify the Fourteenth Amendment and guarantee full suffrage to African Americans before being readmitted into the Union. This legislation gained public approval during the 1868 presidential elections. Ulysses S. Grant won the presidency against his Democratic opponent Horatio Seymour, who had labeled Reconstruction unconstitutional and painted African American suffrage as un-American.

The period of Radical Reconstruction lasted from 1867 to 1877. During this period as many as 2,000 African Americans gained public office (including 2 blacks elected to the U.S. Senate), indicating a seismic shift for the South. Nevertheless, white officeholders remained dominant in the South except in South Carolina, where the population was 60 percent black. The new state governments in the South also shifted patronage patterns, empowering what were later to be called "carpetbaggers," often Northern entrepreneurs in the South. Many of these carpetbaggers were former Union soldiers as well as investors involved in the commercial development of the South. In addition, many Southern white "Scalawags" joined forces with the new state governments. Public schools were created throughout the South in this period; railroads and other infrastructure improvements were encouraged. Displaced elites, the Democratic Party, and resentful white Southerners painted all such Reconstruction efforts as corrupt, inefficient, and farcical. Vigilante groups such as

the Ku Klux Klan, with strong ties to the Democratic Party, imposed a new reign of terror on freed blacks and white Republican supporters; not only solitary lynchings but even large armed conflicts ensued. By 1871 federal response was strong, with soldiers dispatched and hundreds of Klansmen arrested.

Nevertheless, white Southern revulsion to Reconstruction and to growing federal power struck a chord in the North. In the 1870s the Liberal Republican faction argued that with Constitutional protections of African Americans in place, the nation should now focus on issues such as corruption within the Grant administration. As a result, in the 1872 presidential election the Liberal Republican platform advocated various economic reforms, free trade, civil service reform, and home rule in the South. Despite the challenge, Grant won reelection. The Liberal Republicans disbanded after the election, yet their critique of Reconstruction permeated U.S. society. In response to the Liberal Republicans' goals, Congress passed a general amnesty act for Southern Confederates, reduced tariff levels, and enacted mild civil service reform in 1872. The Panic of 1873, a major economic depression, provided further incentive to focus on America's financial problems rather than social equality. The economic crisis enabled the Democrats—firmly aligned with displaced Southern elites and white supremacists—to retake the House in 1874, the first time since before the Civil War.

While military Reconstruction continued until the Bargain of 1877, which granted Rutherford B. Hayes the disputed presidency in exchange for the removal of federal troops from the South, united Republican attempts to achieve racial equality had already been abandoned. As Northern antipathy grew toward African American equality, many of the social, economic, and political improvements gained by African Americans dissipated. For instance, in the early years of Radical Reconstruction (1867–1877), African American voting rights were protected by federal troops, leading to the election of 16 African Americans to Congress. The power shifted to Southern Democrats. In Mississippi in 1875, for example, white rifle clubs murdered Republicans and drove African Americans

from voting places. However, as Northern concerns shifted to other issues, Southern violence toward former slaves continued to rise. There were as many as 1,000 lynchings between 1900 and 1915. “Redeemers,” white Southern Democrats who resented Reconstruction, assumed political control. By the end of the century, African Americans faced increased disenfranchisement and economic enslavement (sharecropping) in addition to a segregated Southern society.

Authors Mark Twain and Charles Dudley Warner dubbed the period from 1865 to 1900 the “Gilded Age” to describe its rampant commercialism, ostentatious displays of wealth, growing class divide, and corruption. Gilded Age political campaigns were highly competitive and were supported on all levels of government by the rewards of political patronage. The period was marked by the rise of large political party “machines” in urban centers and on the state level. On the federal level, the Grant administration was lampooned for its patronage-based corruption. The assassination of President James A. Garfield by a turned-down aspirant for a patronage position inspired Garfield’s vice president, Chester Arthur, to undertake civil service reform when he assumed the presidency. Civil service reform, that is, requiring testing and qualifications for bureaucratic and governmental jobs, also became a touchstone in Theodore Roosevelt’s political career.

American industrialization and the growth of corporations, the primary phase of which was from 1865 to 1900, shaped Gilded Age politics and society. At the beginning of this period there were few corporations besides railroads; by 1904, 300 corporations controlled 40 percent of all manufacture in the United States. Initially America’s economic transformation was not matched by political regulation. As a result, instability and corruption ensued. For instance, in the late 1860s U.S. congressmen were bribed to cover up the Union Pacific railway’s fraudulent contracts with the construction company Crédit Mobilier. Competition and the pursuit of profits led to shoddy labor practices, and thousands of labor strikes occurred throughout these decades and well into the twentieth century. There were no social safety nets for the poor except what was offered by the political machines and their

“bosses,” who relied on the votes and loyalty of new immigrant populations in exchange for jobs, food, and medical and other temporary aid. Even as great corporations grew, economic instability marked the period. Credit was difficult to obtain for small businesspeople and farmers. Farmers rejected a gold standard in favor of silver production and paper currency to loosen credit. Galvanized by this and other issues, the Farmer’s Alliances formed in the 1870s, a precursor to the Populist Party of the 1890s.

What has been termed the Gilded Age merged into the Progressive reform movements of the turn of the century, as social reformers and politicians of both political parties attempted to address the issues of growing corporate strength and monopolistic practices, political machine corruption, and the poverty, disease, and growing discontent of the laboring class.

Canadian Westward Expansion

The Canadian west stretches from the grasslands of present-day Manitoba to the Pacific shores of British Columbia. The vast space in between experienced a history of settlement and expansion

► THE DOUKHOBOURS IN CANADA

The Doukhobours, who came to Canada in the late nineteenth century, were an offshoot of the Russian Orthodox Church treated as heretics for their simple faith, which rejected what they considered the idolatry and opulence of the Church. Led by Peter Verigin, 7,500 Doukhobours settled in present-day Saskatchewan in 1899. Their settlement exemplifies the great lengths that the Dominion government was willing to go to encourage groups to migrate to Canada. Sir Wilfrid Laurier and Clifford Sifton promised the group that they would be free to follow their religious practices, would not be conscripted, and could organize themselves according to their belief in communal property. Each male migrant was given 160 acres (65 hectares) of land. Changes made by the Dominion government to the rules governing communal

property rights in 1906–1907 split the community. The largest faction followed Peter Verigin to British Columbia. Others chose to adapt to the government's new policies that divided properties into homesteads. The most extreme group, the Sons of Freedom, protested the changes. They organized demonstrations (often demonstrating while naked) and destroyed property, resulting in frequent confrontations with Canadian authorities. The community declined after Peter Verigin died in a 1924 train bombing incident, the causes of which have not been determined. The federal government arranged for his son to come from Russia in 1927 to lead the community in British Columbia, but his radicalism and antiauthoritarianism made him an ineffective leader.

—*Laura Madokoro*

that is as diverse as the geography it covers. Three distinct, if somewhat overlapping, periods characterize westward expansion from 1750 to 1914: contact and trade among European explorers and native peoples (1750s–1860s), construction of and settlement along the transcontinental railway (1880s), and large federal immigration schemes (1896–1905). Each of these phases left an indelible mark on the development and character of the Canadian west.

When the first European traders penetrated the west in the 1730s, the prairie regions of Canada were home to hundreds of native tribes, with total populations estimated to range from 17,000 to 60,000. French and English traders competed for trade until the French were forced to cede their territorial claims in Canada in the wake of their defeat in the Seven Years' War (1756–1763). The Hudson's Bay Company monopolized British trade, thanks to a charter received from Charles II in 1670. Its expanding trade routes led to early settlements concentrated around trading posts such as those at Cumberland House and Lake Athabasca, in present-day Saskatchewan. By 1804 there were over 400 posts in the western region of Rupert's Land, the vast territory over which the company was *de facto* ruler, compared to 17 in 1774. In contrast, the early settlement of British Columbia was largely restricted

to Vancouver Island and the coast until the early nineteenth century, when explorers David Thompson and Simon Fraser established trading posts in the Rocky Mountains in 1811 and 1806–1808, respectively.

The 1840s mark a transition point in the history of westward expansion. As the fur trade declined, agriculture grew in importance, and the prairies began to attract homesteaders from eastern Canada and Europe. After confederation in 1867, the federal government played an increasingly active role in shaping and controlling the region's development. It negotiated treaties with native leaders so that by 1877 native territories were officially reduced to the spaces confined within seven reserves. To further consolidate its territory the government purchased Rupert's Land from the Hudson's Bay Company for £300,000 in 1869 and prepared settlement schemes to discourage possible U.S. expansion. Surveyors were dispatched to partition and allocate tracts of land to potential homesteaders. As more settlers moved into the region, conflict with the native peoples and Métis (people with European and native ancestry) increased. It culminated in 1869–1870 during the Red River Rebellion led by Louis Riel, head of a self-proclaimed provisional government. To resolve the conflict, the federal government passed the

Manitoba Act, which established the province of Manitoba in 1870 and gave legal title to the Métis for the lands they farmed.

The completion of the transcontinental railway in 1885 encouraged further westward migration. Under the government of Prime Minister Wilfrid Laurier, Clifford Sifton, minister of the interior from 1896 to 1905, developed ambitious plans to settle the west by promoting immigration from the United States, Great Britain, and continental Europe. Publicity campaigns in Europe promised prosperous and fertile lands, describing Canada's west as a Promised Land or a Garden of Eden. Thousands came from Eastern Europe, but the largest immigrant groups were Germans (100,000) and Scandinavians (170,000). Migrants received subsidized travel and land grants in return for their commitment to farm the land. The federal government also offered additional incentives to particular ethnic groups. Mennonites, Icelanders, Doukhobors (a persecuted Russian religious sect), and hundreds of Ukrainians were promised the right to settle as ethnic blocs and were granted freedom from military conscription (which they feared or in some cases opposed for religious reasons). Thousands of settlers also came north from the United States. Others came from the west, such as the Chinese migrants who came to Canada to build the railway in the late nineteenth century or the thousands of migrants who made their way from California and Asia upon news of gold strikes in the Yukon in 1897. Many Chinese remained in cities along railroad routes, where they started their own small businesses or worked as manual laborers.

The railway and the promotion of the Canadian west caused the populations of British Columbia, Alberta, Saskatchewan, and Manitoba to increase from 1.7 percent of total Canada's population in 1871 to 23.8 percent in 1911. Cities also became a prominent feature of the western landscape. At the end of the nineteenth century, Winnipeg (population 26,000 in 1891) was a major financial and trade center, while Calgary (population 4,000 in 1891) was home to many businesses tied to the cattle industry, including stockyards, abattoirs, and tanneries, and later became an important manufacturing center. Upon the completion of the Panama Canal in

1914, Vancouver (population 155,000) became the most important port in western Canada.

Yet the outbreak of war in 1914 interrupted migration flow from Europe and altered the nature of the western economy, marking a distinctive break in the early years of westward expansion and the period of industrialization and natural resource exploitation that followed.

Self-Government in Pre-Dominion Canada—The Durham Report

Completed in January 1839, Lord Durham's *Report on the Affairs of British North America* made effective self-government in the colonies of Lower Canada (Quebec) and Upper Canada (Ontario) possible. One of the main recommendations of Durham's *Report* was "responsible government," the notion that any government needed the support of the majority of the elected members of the colonial parliament in order to remain in power. This idea had been in the air for years in the two Canadian colonies. However, because of the political turmoil created by Durham's other key recommendation that the French Canadian majority in Lower Canada should be transformed into English Canadians and the British government's own doubts about the viability of responsible government in its overseas territories, colonial politicians were unable to bring that measure into effect until 1848.

Lord Durham's *Report* would have been unnecessary had it not been for the failure of the

THE REBELLION LOSSES BILL, 1849

Self-government was put to the test in the united colony of Canada between February and April 1849. The government of Robert Baldwin and Louis-Hippolyte Lafontaine, which had pushed for colonial autonomy for much of the 1840s, was determined to pass the Rebellion Losses Bill, legislation that would have compensated anyone whose property had been damaged during the Lower Canadian rebellion in 1837, including the rebels themselves. Colonial Tories were equally determined to kill the bill, seeing it as a disloyal measure.

The Tories appealed to the governor-general of Canada, Lord Elgin, to stop the bill's passage. Lord Elgin disappointed them. Following the rules of responsible government, he refused to veto the Rebellion Losses Bill, since the Baldwin-Lafontaine government had the support of a majority of the members in the colonial assembly. In response, a Tory mob gathered in Montreal, the colony's capital, to protest the bill. They harassed Lord Elgin and his family, attacked Lafontaine's house, and burned down the Parliament building. Baldwin and Lafontaine, however, did not back down. The Rebellion Losses Bill became law, with the blessings of the governor-general and the British state.

—Todd Webb

first British attempt to establish a system of self-government in Lower and Upper Canada. In 1791, the Tory government of William Pitt the Younger passed the Constitutional Act. This legislation was meant to correct the flaws in colonial government that Pitt and his fellow conservatives believed had been responsible for the outbreak of the American Revolution in 1776. Pitt's government aimed to curb the role of the colonists' directly elected representatives in the governments of Lower and Upper Canada. The Constitutional Act created a political system in which a British-appointed executive could act independently of the elected assembly in most matters. Not surprisingly, this constitutional arrangement led to constant conflicts between the executive and the assembly in both colonies. During the mid-1830s, those battles resulted in the paralysis of the political system, with a discontented majority in the assemblies demanding

greater political power and the members of the executive in each colony digging in their heels to protect their own interests and to prevent what they saw as the danger of an American-style revolution in Lower and Upper Canada.

Still, the situation in the two colonies was not quite as bleak as this picture of political deadlock suggests. Moderate political reformers had been arguing in favor of a new form of government since the 1820s. Two English Canadians, William Warren Baldwin and his son Robert, embraced the idea of responsible government. Before the Baldwins could bring about change peacefully, however, radical reformers in Upper and Lower Canada launched a series of armed efforts to overthrow the existing political regime in the autumn of 1837. The colonial governments in Lower and Upper Canada responded by crushing the uprisings. Things had gone badly for the radical reformers, but in the aftermath of the rebellions British statesmen were forced to reevaluate colonial policy. In January 1838, the Whig government appointed Lord Durham as high commissioner and governor-general of British North America to investigate the situation and to suggest measures that might restore peace.

Durham, one of the most progressive thinkers in the Whig Party, was well suited to the task. His support for the Reform Bill of 1832, which expanded the British electorate, earned him the nickname "Radical Jack." He was willing to entertain any new ideas that would keep Lower and Upper Canada in the British Empire. However, Durham's time in the Canadian colonies was short and not without controversy. He sent several rebel leaders into exile without a trial, and his actions were criticized in the British House of Commons. Angered by what he believed was a lack of support from the prime minister, Durham returned to Britain in May 1838, having seen enough of the colonies to write his *Report*.

Durham's *Report* recommended sweeping changes in the government of the Canadian colonies. True to his progressive background, he adopted the William Warren and Robert Baldwin idea of responsible government and made it his own. Durham also suggested, however, that responsible government could not work

in colonies divided along ethnic lines between English and French settlers. He therefore called for the union of Lower and Upper Canada in an effort to assimilate the French Canadians who, under this new arrangement, would be outnumbered by the English Canadians. The Whig government in Britain was keen to adopt Durham's policy of assimilation, but it proved wary of responsible government. The Whigs feared that the colonists would use any newly acquired political power to transform the united province of Canada into an independent state. Durham himself did not live to see what his fellow Whigs did with his *Report*. He died of tuberculosis on July 28, 1840.

The mixed message and partial implementation of Durham's recommendations led to eight years of political conflict in Canada. The British government sought to hold responsible government at bay and promote the absorption of the French Canadians by the English Canadian majority. Simultaneously, however, Robert Baldwin formed an alliance with the leader of the French Canadians, Louis-Hippolyte Lafontaine, in an effort to gain a full measure of political autonomy in the colony and to preserve French Canadian culture. While ignoring Durham's call for ethnic unity, Baldwin and Lafontaine pointed to his support for responsible government to bolster their own case. After all, no one could accuse Lord Durham of seeking to break up the British Empire. Faced with the growing electoral strength of the Baldwin-Lafontaine alliance, the British finally bowed to colonial pressure in 1848. It abandoned the policy of assimilation and adopted his call for responsible government. Within a year, self-government became a working reality in the united province of Canada.

Politics in Postconfederation Canada, 1867–1914

Four founding provinces, Upper Canada (Ontario), Lower Canada (Quebec), Nova Scotia, and New Brunswick, entered the Canadian Confederation in 1867 after several years of negotiations and conferences between Canadian and British representatives culminated in the approval of the British North America Act by the British Parliament. From this starting point, Canada grew in the late nineteenth and early twentieth centuries to closely resemble what it is today, a country of ten provinces and three territories. The ten provinces include the original four plus Manitoba (1870), British Columbia (1871), Prince Edward Island (1873), Alberta (1905), Saskatchewan (1905), Newfoundland (1949), and Labrador (1949). Territories (which only have powers delegated to them by the federal government rather than the constitution) include the Northwest Territories (1870), Yukon (1898), and Nunavut (which was part of the Northwest Territories until 1999).

Canada's constitution established a parliamentary form of government modeled on that of Great Britain. Its Parliament consists of the House of Commons, whose members are elected by the populace, and the Senate, whose members are appointed by the governor-general (the representative of the British Crown) with the advice of the Canadian prime minister. Originally the House of Commons had 181 members, each representing constituents in districts known as ridings. The distribution of ridings is based largely on population, and Ontario, because of its large population, has always had significant political influence in Canada. The Senate has the power to approve or reject bills but rarely goes against the will of the democratically elected House of Commons.

The prime minister is Canada's head of government and sits in the House of Commons. He/she is leader of his/her party and has no term limit. Two major parties, the Liberal Party of Canada and the Conservative Party of Canada (known officially as the Liberal-Conservative

► BECOMING THE DOMINION OF CANADA

Many Canadians, including prominent politicians involved in negotiations leading up to the British North America Act of 1867, supported the idea of calling the new nation “The Kingdom of Canada,” a name that emphasized its continuing ties to Great Britain and its traditions. This was opposed by the British Foreign Office, which feared that such a step would antagonize the United States, many of whose leaders were still angry over Britain’s support for the South during the U.S. Civil War. New Brunswick premier Samuel Tilley is thought to have suggested the name “dominion,” a term then used to refer to lands held by the monarch and, more generally, Britain’s colonies. He supposedly was inspired by several biblical passages, especially Psalms 72:8: “He shall have dominion also from sea to sea, and from the river unto the ends of the earth.” Thus it was that the preamble to the Canadian constitution described the new state as a “Dominion under the Crown of the United Kingdom of Great Britain and Ireland, with a Constitution similar in Principle to that of the United Kingdom.” According to John A. Macdonald, Canada’s first prime minister, a great opportunity had been missed.

—Glenn Duerr

Party prior to 1873), have dominated politics in Canada. In fact, all of Canada’s 22 prime ministers have been from one of these two parties.

Even after confederation, many opposed the new union. In 1867 and 1868 voters in New Brunswick and Nova Scotia, fearing a loss of power and independence, elected anticonfederation representatives to the federal and provincial legislatures. The unity of Canada was seemingly jeopardized. However, after 1869 the intensity of secessionism decreased in the face of British refusal to reconsider the British North America Act and the fear that Canadian disunity would invite U.S. interference and possible annexation.

Other issues confronting postconfederation Canada resulted directly from its territorial expansion. In 1868 the British Parliament approved the sale of Rupert’s Land, which had been controlled by royal charter by the Hudson’s Bay Company since 1670. For £300,000 Canada

in 1870 took control of the vast territories that include present-day Manitoba, most of Saskatchewan, southern Alberta, southern Nunavut, and the northern parts of Ontario and Quebec. The purchase sparked two rebellions led by Louis Riel, a Métis (people of mixed First Nations and European, mainly French, ancestry) leader who sought to protect the rights of the indigenous people in Manitoba and Saskatchewan from the loss of power to the new Canadian government. The first rebellion of 1869–1870, known as the Red River Rebellion, was put down by the Royal Canadian Mounted Police, but the issue of land claims among the indigenous population remained a potent issue. The Northwest Rebellion of 1885 also centered on conflicting land claims, in this case farther west in the area of present-day Saskatchewan. The Northwest Rebellion also was suppressed, and in its wake Riel was brought to trial and hanged for treason in 1885.

Economic policy, especially as it related to tariffs, was another major issue in postconfederation Canada. In the 1870s when Canada was plunged into an economic recession, tariffs were raised from 15 percent to 17.5 percent, mainly as a means to raise revenues. As the recession deepened, the Conservative Party, under the leadership of John A. Macdonald, formulated its National Policy, which called for federal assistance for railroad construction, federal control of land policy, and even higher tariffs on imported manufactured goods to protect Canada’s nascent manufacturing industries. On taking power in 1879, the Conservatives raised tariffs on U.S. manufactured goods to 30, 35, and even 45 percent. Supporters credited the National Policy for bringing about the revival of Canada’s economy in the early 1880s, but as economic stagnation set in later in the decade, critics in the Liberal Party called for tariff reduction. On taking power in 1897, the Liberals sponsored tariff reforms that provided for preferential treatment for Great Britain, most of its colonies, and many of its trading partners. In 1911 its proposal to reduce some tariffs on U.S.-manufactured goods was rejected in the House of Commons and subsequently by the electorate, which returned the Conservatives to office.

Another major issue in postconfederation Canada was immigration policy. From the 1880s

onward Canadian governments encouraged immigration, mainly by northern Europeans interested in farming. Many Canadians became concerned when thousands of Chinese migrated to Canada to work on the Canadian Pacific Railroad. In 1885 the government passed the Chinese Immigration Act, which imposed a head tax on all Chinese immigrants. The amount of the tax was raised in 1900 and 1903. In 1923 the Chinese Immigration Act banned all Chinese from entering the country except diplomats, children of Canadians, students, and certain businessmen.

Conservatism and Liberalism in Nineteenth-Century Latin America

Almost all of Latin America achieved independence from European powers in the first quarter of the nineteenth century. With the notable exception of Brazil, these became independent republics following European and U.S. models of governance. Disagreements between the literate and politically active elite of these new nations erupted, and soon there emerged two ideological camps, commonly referred to as Conservatives and Liberals. Conservatives argued for minimal social change, while Liberals were interested in bringing “progress” to the region by imitating economic and cultural developments in Europe and the United States. While most Latin Americans remained Catholics, Liberals generally sought to limit the role of the Church in civic affairs. For example, in midcentury Mexican

Liberals passed a series of acts restricting the right of churches to own property and abolishing *fueros*, or special exemptions for clergy.

After their victories in the wars of independence, Latin American intellectuals and political leaders, including the liberator Simón Bolívar, were unsure of the wisdom of extending democracy to their entire societies. At first some argued for the creation of monarchies, and in fact there were some experiments along this line, such as that of Brazil and the brief monarchical claim of Agustín I of Mexico in 1823. Generally, Liberal successes meant that some limited form of democracy gained support, although neither Liberals nor Conservatives were interested in turning over power to the masses. Conservatives at first ensured that many colonial

KEY DIFFERENCES BETWEEN LIBERALISM AND CONSERVATISM

Summarized below are some of the differences between the Liberal and Conservative perspectives in nineteenth-century Latin America:

Liberal	Conservative
Urban	Rural (many large landowners)
Anti-church control	Pro-church
Replicate Europe	Maintain traditional values
Progress	Stasis
Free trade	State control
Equality	Patriarchy
Individualism	Paternalism
Federalism	Centralism

These are only general patterns. For example, liberals in Argentina favored a centralized form of government, probably because they were mostly located in the capital city of Buenos Aires and did not trust whom they perceived as the less civilized Argentines elsewhere. Yet generally these patterns persisted across the region, including within Brazil even though a monarchy prevailed there until 1889. In fact, other conservative leaders besides the Brazilian monarch were influenced by Liberalism, including Emperor Maximilian of Mexico, who had been put in power after the French invasion.

—Rick Warner

institutions and practices continued, such as special privileges (*fueros*) connected with lands owned by churchmen, religious institutions, and military men, and centralized control of the economy as opposed to free trade. Socially, Conservatives defended the “corporate status” of certain groups including the Church and indigenous communities, placing them outside civil law. Liberals sought to replace these traditions with social and economic systems drawn from the United States and western Europe.

Since the struggles between the two camps culminated in the triumph of Liberalism at the end of the nineteenth century, the story of the conflict is often described as the “rise of Liberalism.” In several countries, such as Mexico and Argentina, the two groups fought a series of wars through the middle of the nineteenth century, while in other places, such as Brazil, the disagreements were pursued within the existing political system. The conflict in Mexico caused constant unrest, as heads of state changed frequently and the young nation was easily attacked by the United States and France as a result of the dissension.

The roots of Liberalism are the European Enlightenment, the American Revolution, and the French Revolution. Although Latin Americans continued throughout the nineteenth century to adhere to Roman Catholicism, their view of the Church changed drastically, just as it had for French intellectuals in the previous century. While the colonial-era Church maintained power over the lives of individuals with special privileges and significant landholdings, the more secularist Liberals worked to eliminate these advantages. Later in the nineteenth century Liberals were strongly influenced by the philosophy of positivism, as espoused by the French thinker Auguste Comte (1798–1857). Positivism was a theory of progress in human history that extolled scientific thought. An intellectual culture entered Latin American governance, evidenced, for example, by the role of the *científicos* (scientific ones), federal ministers of the Mexican regime of Porfirio Díaz.

Although not all countries experienced the same level of conflict, Conservative-Liberal disagreements dominated political discourse all over the region until the last quarter of the century. In the twentieth century Latin American

political leaders, some of whom were educated as economists in the United States, turned to neoliberalism, a modern reinvention of Liberalism that supports free trade in the new era of globalization through pacts such as the North American Free Trade Agreement (NAFTA).

Nineteenth-Century Latin American Politics—Centralists versus Federalists

After achieving independence from Spain in the early 1820s, the new republics of Latin America began the difficult process of writing constitutions and establishing national governments. In many countries there were conflicts between advocates of centralism, which endorsed the principle of a strong central government, and federalism, whose proponents supported a system of government in which power was divided between the central or national government and regional authorities, often in the form of states or provinces. Federalism in Latin America was modeled primarily on the U.S. Constitution but also incorporated concepts from ancient and modern European examples. Generally, proponents of centralism were conservatives, whereas supporters of federalism were labeled liberals. However, these distinctions were often blurred.

Simón Bolívar, the “liberator” of much of South America, opposed federalism because he viewed it as a weak system unsuitable for the cultural and historical realities of Latin America. Despite Bolívar’s opposition, three of the largest Latin American countries—Argentina, Mexico, and Brazil—eventually adopted the federal system and continue to use it today.

The conflict between centralism and federalism was particularly acute in Argentina in the

aftermath of independence. Unlike other parts of Latin America, the federalists in Argentina were represented by conservative elements based in the interior provinces. Centralists in Argentina were known as the Unitarios, and their greatest influence was in Buenos Aires, the capital. Argentina's Constitution of 1819 was a victory for the Unitarios, as it created a strong central government and granted little autonomy to the provinces. The feud continued with the election of Bernardino Rivadavia, a liberal and Unitario, to the presidency in 1824. Rivadavia brought much-needed reform to Argentina and attempted to unite the country. Conservatives in the provinces opposed his reforms, and he resigned in July 1827, whereupon conditions in Argentina became chaotic. In 1835 Juan Manuel Rosas became dictator of Argentina. A strident federalist, Rosas used his absolute power to rid Argentina of the Unitarios. Ironically, Rosas established a strong central government and used the support of both loyalist gauchos from the provinces and the Catholic Church as the basis of his powerful dictatorship. Rosas was overthrown in 1853, and his ouster opened the way for a modified federal system under a new constitution.

In Mexico, centralism was synonymous with conservatism, mainly supported by wealthy oligarchs who held the indigenous population in virtual serfdom on large feudal estates and favored the union of church and state, a strong army, and education for the elite only. The Liberal Party stood for separation of church and state, public education, and a federal system of government. Conflicts between centralists and federalists raged in the first four decades of the Mexican Republic. In the end, Mexico selected a federal system as indicated by the constitution of 1857 and continued under the constitution adopted in 1917. An outward expression of Mexico's federalism is the official name of the country, Estados Unidos Mexicanos (United Mexican States).

Brazil did not experience the tension between centralism and federalism, as it was a monarchy until 1889. Brazil became a republic under the Constitution of 1891, which resembled the U.S. Constitution, and adopted a federal system. Federalism's dominance is reflected in Brazil's official name, Estados Unidos do Brasil

(United States of Brazil). Colombia also experimented with centralism and federalism throughout the nineteenth century. When liberals were in control, Colombia usually had a federal system. An example was the Constitution of 1863 that gave extraordinary powers to the states, including their own armies and postage stamps.

The small republics of Central America have always opted for centralism, as have Paraguay and the Dominican Republic. Other Latin American nations experimented with forms of both federalism and centralism in the nineteenth century. With the exception of Mexico, Brazil, and Argentina, many of the nations of Latin America blended aspects of the two systems. Another interesting outcome of the conflict between federalists and centralists was that in time political differences came to be focused less on fundamental constitutional issues and more on the personalities of leaders and the loyalty of their followers.

Church-State Relations in Latin America after Independence

While some of the leadership for the Latin American independence movement came from the clergy, most notably Father Miguel Hidalgo and Father José María Morelos in Mexico, the relationship between the Roman Catholic Church and the newly independent republics was largely antagonistic. There were two reasons for this conflict: the Church's support of the Spanish Crown during the wars of independence and the basic tenets of Liberalism, the ideology to which most of the rebel leadership subscribed.

During the wars of independence in Venezuela, Church officials used the 1812 earthquake, which devastated areas held by rebel forces but left areas under royal control unscathed, as a sign that God opposed independence. The Church also condemned much of the leadership for its involvement in Freemasonry, an anathema to Catholic dogma. In Mexico, Hidalgo and Morelos were branded as heretics, excommunicated, and sentenced to death by the Inquisition.

Liberals, most of whom were drawn from the ranks of the educated and well-to-do, envisioned secular states in which individuals would have the opportunity to achieve their full potential and to make use of their natural creativity to benefit themselves and society as a whole. They favored constitutional republics based on rationalism, the free exchange of ideas, and economic freedom. They tended to view the Roman Catholic Church, with its vast wealth, dominance of education, and undue influence in banking and other financial services, as an impediment to achieving these ideals. They also believed that the Church represented an outmoded ideology based on theological obscurantism, superstition, and archaic rituals rather than the rationalism and science of the modern age.

With the achievement of independence, some Church officials saw an opportunity to expand their power in Latin America since Spain's defeat meant the end of the Patronato Real (Royal Patronage) by which the Crown had controlled ecclesiastical appointments in its colonies. The new republics, however, soon assumed control not only over appointments but also over the collection of tithes. Several states under Liberal leadership confiscated Church property and undertook efforts to take over functions that in colonial times had been performed by the Church. These included education, recording of vital statistics, charitable and social services, and even maintenance of burial grounds. While most Liberals continued to profess their personal religious belief as Roman Catholic, they also wanted to reap some of the benefits of Protestant evangelism and to maintain friendly relations with the United States. Therefore, many of the new constitutions had the contradiction of declaring Roman Catholicism as the official religion of the republics while at the same time containing

clauses that proclaimed religious liberty and freedom of conscience.

Not surprisingly, the Church took the side of conservative political factions as the nineteenth century unfolded. Conservatives viewed Catholicism as useful in maintaining civil order by providing a moral dimension for strong central government. Therefore, they promoted the unity of church and state as a means to maintain law and order. The alliance of Conservatives and the Catholic Church had negative implications for the Church. The Church was often identified as opposing progress and condoning the repressive regimes of caudillos who used the support of the Church to maintain power. In 1864 Pope Pius IX formalized Rome's vehement opposition to the ideas of rationalism and liberalism when he published the *Syllabus of Errors*, a pronouncement that condemned lay education, freedom of thought, religious toleration and the separation of Church and state. Liberal governments ignored the *Syllabus*, and Conservatives applauded it. In Ecuador, President Gabriel García Moreno dedicated the nation to the sacred heart of Jesus and invited the Jesuits to return. However, by the end of the nineteenth century the Liberals had largely prevailed, and the influence of the Catholic Church in education, social services, and politics had been greatly diminished in Latin America.

Caudillos

As regional leaders who successfully attained national power (often by force), *caudillos* have held pivotal roles in the histories of several Latin American nations. Historians and social scientists have engaged in debates concerning the

➤ RAFAEL NÚÑEZ—FROM LIBERAL TO CAUDILLO

Rafael Núñez began his political career in Colombia in 1848 as a liberal associated with the anti-clerical faction. As a young politician he signed a constitution that reduced Catholic power in the country. Núñez, however, gradually grew disillusioned with the radical liberal forces in the country for their failure to bring unity and order to the nation. He was to the presidency elected as a moderate in 1879 and began to institute his program of reform designed to stabilize and centralize the country. Not a caudillo yet, he stepped down per the requirements of the constitution and waited two years to again run for the

presidency. His alliance of moderates and conservatives alarmed the radical liberals in the country, who revolted. Though the rebellion was put down, Núñez determined that it proved that necessary changes in government could not be made through constitutional means, and he assumed increasingly autocratic powers to enact his plan of centralization. Caving to the conservative interests, he reconciled himself with the Church and effectively ran the country until his death in 1894. The instability of Latin American governments often turned liberals such as Núñez into caudillos.

—Gerrit Dirkmaat

characteristics of caudillos, particularly as they tended to be controversial figures, sometimes hailed for protecting national interests, sometimes vilified for their damaging authoritarian rule. Caudillos possessed common characteristics, including a propensity for charismatic leadership, recourse to coercion, and dictatorial practices that circumvented established norms of governance. Caudillos also secured access to and control over economic and political resources, and relied on the support of loyal followers who benefited from systems of patronage.

The term extends back to the Latin word *caput* (meaning “head” or “person”), and old explanations for the rise of caudillos assumed a cultural orientation and continuous tradition of authoritarianism that extended back to Roman times. Recent scholarship has moved away from notions of caudillos as expressions of cultural character and has instead emphasized the importance of historical circumstances in their rise to power. The absence of formal political power and legitimacy facilitated the rise of caudillos, as did weakness in state institutions and political parties, especially in regions far from political centers. Caudillos might also gain power by drawing support from patron-client relationships. A certain generality surrounds the term “caudillo,” as shown in its occasional confusion with the term “cacique.” Contemporary usage sometimes proved vague, with a leader being described as a caudillo because of the way he wielded power in relation to public office,

constitutional arrangements, and notions of legitimacy as conferred through institutions.

Following the conquest of Mexico and Peru, Spanish *encomenderos* (individuals who received so-called *encomiendas*, grants of Indian tribute and labor), including Hernando Cortés, are said to have assumed characteristics of caudillos. Similarities to caudillos have also been observed among *hacendados* (owners of large landed estates) in the late colonial period. With independence, caudillos rose in prominence as the colonial system collapsed, assuming power with the help of personal armies.

Historians have identified two types of caudillos. With the instability of emerging nation-states between 1800 and 1870, “classic” caudillos assumed power by using force and gaining popular peasant support. Caudillos of this period included Antonio López de Santa Anna (1794–1876) in Mexico, Juan Manuel de Rosas (1793–1877) in Argentina, and José Antonio Pérez (1790–1873) in Venezuela.

Subsequent “modern” caudillos have included the Mexican dictator José de la Cruz Porfirio Díaz (1830–1915), who promoted strong nationalist tendencies and came to power at a time of increased political stability. Modern caudillos encouraged the institutionalization of authoritarian practices based on the state’s monopoly on force. Historians debate whether the leaders of the Mexican Revolution displayed the characteristics of caudillos, and a few historians suggest that the postrevolutionary generation of politicians in the

1920s, like some contemporary North American politicians, embodied new forms of *caudillismo*. The postrevolutionary Mexican state, some have asserted, succeeded in completing the process of institutionalizing caudillismo.

La Reforma in Mid-Nineteenth-Century Mexico

The Reform, or La Reforma, refers to an important period of political, social, and cultural change in Mexico from the mid-1850s to the mid-1870s. After Mexico achieved independence from Spain in 1821, two ideologies, Liberalism and Conservatism, dominated Mexican politics. Conservatives, representing the landowning and mining aristocracy, members of the Church hierarchy, high military officers, and some merchants and manufacturers, sought the continuation of many of the policies of the colonial period that favored the Church and the upper classes. Liberals, representing provincial landowners, professionals, artisans, and the lower ranks of the clergy and military, sought to limit the power and privileges of the upper class and the Church. The Liberals were divided between the more conservative *moderados* and the *pueros*, who favored rapid and sweeping changes.

Conservatives under Antonio López de Santa Anna ruled Mexico for the greater part of the 20 years between 1834 and 1854, during which time they implemented policies that favored the upper classes and the economic interests of the heavily populated central core of Mexico centered in the cities of Mexico City, Puebla, and Veracruz. Their neglect of other regions, the loss of Texas in 1836, and defeat in the Mexican War

in 1847 paved the way for a succession of moderate administrations in the late 1840s and early 1850s. However, a Conservative revolt in 1853 led to the restoration of Conservative government under Santa Anna. He ruled as a dictator until he too was overthrown in 1854 as a result of a Liberal revolt led by Juan Alvarez, a politician from Guerrero, and Ignacio Comonfort, a moderate general. Their Plan de Ayutla called for the end of the dictatorship and elections for a constitutional convention. After Santa Anna went into exile in 1855, Liberals took control of the government, and La Reforma began.

Three laws in particular defined La Reforma. The Ley Juárez, promulgated by the minister of justice Benito Juárez, eliminated the institution of the *fueros*, special rules from the colonial period that benefited the clergy and military personnel. The law narrowed the power of the special courts that had served these populations. The Ley Lerdo, named for the minister of the treasury, Miguel Lerdo de Tejada, barred the Church from owning land or real property that was not necessary for ordinary religious purposes. This was significant, since the Church was a major landowner (and moneylender) dating back to the colonial period. Finally, the Ley Iglesias, passed in 1857, restricted the right of the Church to charge excessive fees for providing sacraments. In sum, the three laws all targeted the social and economic power of the Catholic Church.

Another major step in La Reforma was the writing of a new constitution by a constitutional convention in 1857. The constitution affirmed the previous Reforma Laws and guaranteed the freedoms of speech and assembly. Capital punishment and cruel and unusual punishment were banned, as was the right of ecclesiastical corporations to own land. A single house replaced Mexico's bicameral legislature. In some regards, the constitution was more progressive than those of Western democracies of the day.

Tensions between Conservatives and Liberals continued, and after the promulgation of the new constitution, a Conservative rebellion resulted in a civil war, the War of the Reform, from 1857 to 1861 in which two parallel governments were established. Although Conservative forces dominated the early fighting, by mid-1860 the

Liberals, led by Benito Juárez, gained the upper hand and prevailed in 1861.

Further trouble followed when Mexico defaulted on debts owed to European powers. Spain, Great Britain, and France agreed to invade Mexico to force collection of the debts. Eventually only France carried through on the threat, partly at the invitation of Conservative forces within Mexico. The French army was defeated on May 5, 1862 (later celebrated as Cinco de Mayo) at Puebla by the forces of the young general Porfirio Díaz. The French eventually prevailed, however, and were able to install the Austrian Maximilian on the throne. Mexican conservatives at first supported the new emperor, but ironically he was considered too liberal for many Conservatives, causing their disaffection. Juárez, who had led a parallel state during the reign of Maximilian, returned to the capital in 1867. Maximilian was taken to nearby Querataro and executed.

Juárez, the hero of Mexican resistance to Maximilian, resumed the presidency in 1867. Despite the damage caused by years of civil war and rebellion, he committed resources to the expansion of the public school system and the construction of an important railroad line from Veracruz through Puebla to Mexico City. His land policy focused on the introduction of capitalism in rural areas at the expense of indigenous communities, much of whose lands fell into the hands of wealthy hacienda owners.

Historians mark the end of La Reforma at 1876, when Porfirio Díaz, the hero of Cinco de Mayo, began his long rule. The Díaz period, or Porfiriato, was a time of increasing oppression of the masses and ended with the Mexican Revolution of 1911. However, many of the changes of La Reforma remained in place, especially secular control of Church affairs.

Mexico Under Porfirio Díaz

Dictator of Mexico from 1876 to 1911, Porfirio Díaz (1830–1915) is generally considered a villain in Mexican history. His manipulation of the political system, use of strong-arm tactics to control the Mexican people, and economic policies that promoted foreign dominance and worked to the detriment of most Mexicans, encouraged dissent. In 1910, this dissent resulted in the Mexican Revolution.

Díaz, of Mixtec Indian and Spanish heritage, was born into a poor family in the state of Oaxaca in 1830. After several years of study in the local seminary, Díaz rejected the priesthood and enrolled in the Institute of Arts and Sciences of Oaxaca. There he experienced a curriculum influenced by the liberal philosophy that attracted the likes of Benito Juárez and that emphasized the rule of law and constitutional freedoms. Mexico's volatile political situation, however, ultimately settled Díaz on a military career. As a soldier, Díaz quickly distinguished himself as both a good commander and a staunch supporter of liberalism. He gained fame as a member of the liberal forces that fought in the 1850s War of Reform, and he participated in the campaign against the French invasion of Mexico in the 1860s.

Díaz's liberalism soon turned him into a rebel. In 1871, after Benito Juárez manipulated elections to allow himself another term as president, Díaz staged the Revolt of La Noria. Failing to gain military or popular support, Díaz briefly retired to Veracruz. When Juárez's successor, Miguel Lerdo de Tejada, likewise attempted to continue in office, Díaz led another revolt. The 1876 Rebellion of Tuxtepec, which took as its slogan "Effective Suffrage, No Reelection," succeeded, ushering in a thirty-five-year period known as the "Porfiriato."

Although Díaz revolted under the banner of constitutionalism and democratic rule, he was soon convinced that economic development supervised by a strong central government was the key to Mexico's future. Ultimately, he relegated political democracy to a backseat as he sought to create a stable country conducive to economic modernization. Similarly, Díaz (who coined the phrase "Poor Mexico, so far from God and so close to the United States") rejected the

Mexican dictator Porfirio Díaz, a towering figure in Mexican history who ruled from 1876 until being deposed in the Mexican Revolution of 1910. (Library of Congress)

antiforeign sentiments of many Mexicans and embraced foreign investment as a key to economic growth. The Díaz system stressed peace, order, and stability while pursuing policies designed to make Mexico a modern industrial state.

Individual Mexican states provided the key to the Porfirian political system, as Díaz sought to rule through local elites while playing them against each other. He also encouraged regional military leaders to serve as a counterbalance to local political machines. From Mexico City, Díaz directly intervened in state affairs, helping to fashion electoral slates and rigging elections. He also amended the Constitution to allow the central government to intervene in states in the event of a “breakdown” of order. *“Pan o palo”*—bread or the stick—is often used to describe the Díaz political system. While Díaz preferred a conciliatory approach toward potential rivals,

he was willing to use force against enemies and troublemakers.

As a career military man, Díaz used the army as a tool of coercion, offering promotions and economic incentives to soldiers who helped put down rebellions and otherwise maintained order. The *Rurales*, a federal police agency established under the Juárez regime, continued to be used to control banditry and other forms of criminal activity in the Mexican countryside. Through the widespread use of the *“Ley de Fuga”* or law of flight, by which troublemakers and suspected enemies were summarily executed, the *Rurales* sought to intimidate Mexicans into submission. A final tool in the Díaz arsenal was the *Bravi*, a presidential bodyguard and intelligence service.

The philosophy of Positivism reinforced the Porfirian quest for order and progress in Mexico. Developed in France during the mid-nineteenth century, Positivism embraced a scientific view of things and looked forward to a golden age in which the laws of science would be used to govern and regulate society. In Mexico, President Díaz was surrounded by a group of Positivists, known as *científicos*—the “scientific ones.” Many Mexican *científicos* also adopted social Darwinism, arguing that certain sectors of society (most notably the poor and the Indian population) were destined to die out. The racism and classism inherent in Mexican Positivism prevented a serious consideration of some of Mexico’s most pressing social problems during the Porfiriato and ensured that they would become issues in the Mexican Revolution.

Foreign capital held the key to the Porfirian dream of economic development in Mexico. In addition to providing a stable environment in which to invest, Díaz courted foreigners in a variety of ways. In 1884, a new mining code reversed the old colonial practice that prevented private ownership of subsoil resources. The new law encouraged foreign investment in mining and in the young Mexican oil industry. Porfirian land policies also increased the foreign presence in Mexico’s economy. Díaz began a policy of surveying, dividing, and selling public lands to private owners. In some areas of Mexico, ensuring real estate speculation that adversely affected smallholders, who found themselves cut off from the

resources needed for survival. Díaz also presided over a great era of railroad building in Mexico. Here, too, foreign investment was crucial, and the major Mexican railroad lines linked Mexico to outside markets. Finally, Díaz smoothed relations with the United States by addressing the issue of the volatile border region, agreeing to a pact that allowed American forces to cross the international line in hot pursuit of outlaws.

Porfirian economic policies helped Mexico develop its infrastructure and achieve a degree of financial stability. Porfirian growth, however, did not benefit all Mexicans. In fact, Díaz's policies favorably affected only a fraction of the Mexican people, and some even experienced a decline in living standards as a result of the displacement that accompanied many Porfirian programs. The export orientation of the new economy made Mexico vulnerable, and, coupled with the lack of foreign investment in agriculture, actually caused a decline in Mexico's ability to feed its people.

On the eve of the Mexican Revolution of 1910, the Porfirian system was increasingly out of touch with a country that had experienced significant changes during Díaz's six terms as president. The aging Díaz slipped into the role of elder statesman, while the *científicos* controlled the country. Political dissent grew among all sectors of society. Local elites, including Francisco I. Madero of Coahuila, who had experienced persecution under the Díaz regime, chafed under the restrictive political system. Mexico's nascent middle class protested its lack of political clout, and members of the lower class grew restless as the benefits of Porfirian policies continued to

elude them. An international recession complicated the picture and exposed the vulnerability of Mexico's export-oriented economy. On the eve of the 1910 elections, Díaz himself added more confusion when he hinted to American journalist James Creelman that he might relinquish power and that he would welcome competition for the position of president.

Díaz's words were taken seriously by Madero, who advanced himself as a presidential candidate. Madero's arrest, followed by the predictable rigged elections that awarded Díaz yet another term, served as a catalyst for revolt. By 1911, many areas of Mexico were in a state of rebellion. With the capture of the border town of Ciudad Juárez in June of that year, Díaz finally relinquished power. Although he went quietly into exile in Paris, where he died in 1915, Díaz's presence continued to be felt in the persistence of a Porfirian bureaucracy and army and in the survival of an economic system with a life of its own. Indeed, the Mexican Revolution, particularly in its early phase, was largely a struggle to undo the legacy of Porfirio Díaz.

■ Introduction: The Ottoman Empire, Egypt, and Persia in the Nineteenth Century

The Ottoman empire, Persia, and Egypt, a virtually independent state within the Ottoman empire, differed in many ways, but their rulers all faced a similar challenge in the nineteenth century. They all needed to devise and implement policies to withstand growing

pressures from Europe, whose armies threatened their territories, whose businessmen threatened to take control of their economies, and whose ideas threatened many of their values. All of these rulers were involved in a race against time. Their states needed to be strengthened, and quickly, if

they were to avoid the fate of India, where the efforts of India's princes and once-powerful Mughal emperors failed to prevent a British takeover of the subcontinent. As the entries in this section show, rulers in these three states worked hard to respond to the European challenge and, despite many obstacles, accomplished a great deal. By 1914, however, Egypt was a British protectorate, most of Persia was controlled by Russia and Great Britain, and the Ottoman empire had only a few more years of existence before it collapsed.

For all three states the priority was military reform. Ottoman and Persian defeats by Russia in the late eighteenth and early nineteenth centuries and Napoleon's invasion of Egypt between 1798 and 1801 all revealed the gap between the well-armed and well-disciplined European armies and the poorly trained and frequently mutinous troops who opposed them. In response, the Ottoman sultans Selim III (r. 1789–1807) and Mahmud II (r. 1808–1839) as well as Crown Prince Abbas Mirza of Persia (1789–1833) sought to establish “new order” armies trained by European officers, outfitted in European-style uniforms, and armed with modern guns and artillery. Muhammad Ali, the Albanian general who ruled Egypt as an independent state within the Ottoman empire from 1805 to 1848, went further. Beginning in the 1820s he set about creating a large conscript army trained according to European methods. Ottoman reformers in the 1830s followed his model by reorganizing the army, imposing conscription, and increasing the army's size from 24,000 to 120,000.

Such reforms faced resistance. Many Ottoman and Persian religious leaders opposed any military changes modeled on Christian Europe, and soldiers and officers were comfortable with the status quo. Thousands of conscripted Egyptian peasants expressed their displeasure with Muhammad Ali's army (and its brutal discipline) with their feet, by deserting. Such reforms also were costly. Weapons needed to be purchased, military and engineering schools needed to be founded, subsidies for officer training in Europe needed to be provided, soldiers' salaries needed to be paid, barracks needed to be built, and new government agencies had to be created to oversee and administer the military.

Meeting these costs was a formidable challenge. In the 1830s Muhammad Ali took control of Egypt's agrarian economy by requisitioning approximately half of Egypt's arable land and turning it over to the cultivation of indigo, sugar, flax, and, above all, cotton for sale abroad. He also required peasants to grow these same crops and sell them to the government at artificially low prices. Egypt's commercial importance attracted European investment in banks and railroads, which in turn gave rise to a large European community in Alexandria and Cairo. Economic development was slower in Ottoman lands, where European investors worried about the empire's political instability and poor credit rating. It was slower still in Persia, where foreign investment could be attracted only by granting concessions to European businessmen, who gained exclusive rights to profits in various economic enterprises (banking, tobacco, insurance, construction, and food production, among others) in return for one-time payments and a small share of earnings that went to the Persian government.

Military modernization and economic development faced many obstacles. Large numbers of Ottoman subjects, Egyptians, and Persians were indifferent or hostile to reform, and many government officials, military officers, and religious leaders who favored reform disagreed about what exactly reform meant. Was it a matter of strengthening the military and nothing else, or should it go further to embrace European notions of law and constitutional government? Meanwhile, immediate challenges in the form of wars, rebellions, religious dissent, indifferent rulers, and pressures from Western diplomats and businessmen had to be faced. In the end, however, it was the inability of Ottoman, Egyptian, and Persian regimes to meet the costs of military modernization that doomed them to collapse or subservience to the West.

Egyptian finances spiraled out of control during the reign of Muhammad Ali's grandson Ismail (r. 1863–1879), who borrowed enormous sums from European bankers to pay for the completion of the Suez Canal, new palaces, Egypt's sugar industry, an opera house and theater in Cairo, a postal service, an expanded army, and a war with Ethiopia. In the mid-1870s he was

forced to sell the government's shares in the Suez Canal to the British government for one-fourth of their value. He also had no choice but to relinquish control of government revenues and expenses to English and French officials, who cut expenditures to the bone and allocated 60 percent of all expenditure to debt service. This set in motion a chain of events that led to the forced removal of Ismail from office in 1879, a nationalist rebellion led by Colonel Ahmad Urabi between 1879 and 1882, and finally the suppression of the rebellion and the establishment of a British protectorate in 1882.

Ottoman indebtedness forced Sultan Abdulhamid II (r. 1876–1909) to accept the Ottoman Public Debt Administration, an organization run by European bankers to collect taxes and make sure that interest was paid to European debt holders. Forced cutbacks in the army, the inability of the government to pay officers' salaries on time and pay any salaries at all to the soldiers, and its failure to provide the army with the resources needed to suppress rebellions in Armenia and Macedonia turned many officers against the sultan. A series of army mutinies in 1908, collectively known as the Young Turk Revolution, led to the deposition and exile of Abdulhamid, the last sultan to exercise meaningful authority over what was left of the Ottoman empire.

In Persia, where the economic prospects were bleaker and the forces of decentralization stronger, Shah Nasir ad-Din (r. 1848–1896) and his successors relied on concessions to European businessmen to finance their reform programs, but once the shahs and their entourage took their cuts, money from concessions was never enough to support more than a small poorly trained army unable to resist foreign threats or deal with internal dissent. Worse, foreign concessions deeply angered growing numbers of religious leaders, merchants, government employees, and journalists, whose demonstrations and defiance of the shah led to a brief period of constitutional government in 1906, counter-revolution and civil war in 1907 and 1908, and the partition of the country between Russia and England in 1908. Like Egypt and the Ottoman empire, Persia ran out of time in the race to avoid collapse and subjugation.

—James H. Overfield

Persia under the Zand and Qajar Dynasties to 1900

During the periods of rule by the Zand (1750–1794) and Qajar (1794–1925) dynasties, Persia evolved from a collection of tribal territories that emerged during a period of political turmoil in the early 1700s to a state ruled by Qajar monarchs, who in the nineteenth century took the first steps to modernize Persian society and government. Their efforts had only limited success, and the first years of the twentieth century were marked by revolution, political conflict, and the imposition of British and Russian control over much of the country.

After creating an empire stretching from Iraq to Afghanistan, Persia's ruler, Nadir Shah (1688–1747), was assassinated in 1747, resulting in the collapse of his domains. Following a period of tribal conflict, Karim Khan Zand (r. 1760–1779), a tribal leader and general under Nadir Shah, unified most of Persia and, after taking the title of "regent" of the people" (*vakil-al-ra'aya*), established his capital in Shiraz. A beneficent ruler and political reformer, Karim established a reasonably efficient system of administration, with his relatives, local nobles, and tribal chieftains collecting taxes and carrying out his decisions. He subsidized food prices, kept taxes low, and used state revenues for infrastructure projects such as constructing state granaries. However, Karim's failure to designate a successor led to a new series of tribal conflicts upon his death in 1779.

The chief of one of the Qajar tribes, Agha Mohammad Khan, seized power in 1794, declared himself shah in 1796, and made Tehran the new capital. Qajar power was consolidated by his successor Fath Ali Shah (r. 1797–1834), who, like the Zands, at first relied on princes and local tribal leaders to collect taxes and raise troops. Many provincial leaders resisted Qajar rule, and during the nineteenth century efforts were made to transfer administrative responsibilities to provincial officials appointed by the central government. Nonetheless, throughout the Qajar period the central government's control over the provinces remained weak, and abuses and corruption remained widespread.

The Qajars also had to cope with threats from European powers. Fath Ali fought a

► TURKIC RULE IN PERSIA

Persia is usually associated with ethnic Persians and their language. However, beginning in the mid-eleventh century, its rulers were predominantly ethnic Turks from the Oghuz tribal federation. The Turkic tribes known as the Qizilbash were behind the founding of the Safavid empire in 1501, under which most Persians were converted to the Shia branch of Islam. In the late eighteenth century Persia was ruled by the non-Turkic Zands, who were ethnic Luris, a people related to the Kurds. The Qajars, on the other hand, came from one of the Qizilbash tribes. The general trend in Iranian statecraft during the Zand and Qajar period was that of Turkic or Luri tribal forces in control of the central government, with some of their domains administered by Persian officials. The person who ended Qajar rule, Reza Khan Pahlavi, was from the province of Mazandaran, whose people are related to ethnic Persians but have their own language, known as Manziki.

—*Ibrahim Al-Marashi*

disastrous war with Russia from 1804 to 1813, resulting in the loss of the northern Caucasus. Despite the efforts of Crown Prince Abbas Mirza to modernize the military, defeat in the second Russo-Persian War (1826–1828) resulted in further losses in the Caucasus. Russian successes prompted countermeasures by the British, who provided counsel to the Persians in their negotiations with the Russians and intervened in Persian politics by providing military force to bring to power Abbas Mirza's son, Mohammad Shah. They also provided Mohammad Shah with subsidies during his reign from 1834 to 1848. Their goal was to block Russian influence in the region and thereby protect their interests in India.

Efforts to modernize Persian society began during the long reign of Naser al-Din Shah (r. 1848–1896). This period witnessed the introduction of a postal system, a telegraph system, and the country's first newspapers; planning for a limited railway system; and the founding of the polytechnic school Dar al-Funun in 1851 to train upper-class Persian youths in medicine and engineering. The military created the Persian

Cossack Brigade, modeled on the Russian army and trained by Russian officers. Efforts of Naser al-Din's ministers Amir Kabir and Mirza Hussein to reform the bureaucracy by tackling corruption were resisted from those who benefited from the status quo. Overall, reform and modernization in Qajar Persia had limited results.

Both Naser al-Din and his successor Mozaffer al-Din Shah (r. 1896–1907) faced severe budgetary shortfalls, in part the result of the six visits to Europe undertaken by the two rulers. This resulted in increased reliance on concessions to European businessmen, who in return for making a lump sum payment, promising to pay a share of anticipated profits, and providing the requisite bribes received control over various segments of the Persian economy. The concessions were deeply resented by the Persian people, who in 1892 responded to a recently granted tobacco concession by boycotting all tobacco products until the concession was withdrawn. In 1908 oil was found in the south of Persia, and managed under a concession to the Anglo-Persian Oil Company (APOC). This gave Britain another stake in Persian domestic affairs, as oil would become crucial for its navy, particularly during World War I.

By the early 1900s opposition to Qajar rule was widespread, and in 1905 a revolt staged by merchants in Tehran set off a series of events that resulted in a Persian constitutional revolution and the election of the first Persian parliament in 1906. During the turmoil that followed, Russia and Great Britain announced the Anglo-Russian Entente, by which Russia laid claim to influence in northern Persia and Great Britain laid claim to southeastern Persia. Qajar rule effectively ended when Reza Khan Pahlavi, commander of the Persian Cossack Brigade, took control of the government in 1921 and sent the reigning Qajar shah into exile in 1923. The Qajar era officially ended when the Persian parliament declared Reza Khan shah in 1925.

The Tanzimat Era in the Ottoman Empire

Two reforming decrees of the Ottoman central government, the Rose Garden (Gülhane) Decree of 1839 and the Imperial Rescript of 1856, became landmarks of administrative, social, and economic policy in the empire. These decrees aimed to win continued western European economic and political support, articulate principles for the conduct of administrative reform of the Ottoman government, and establish the ongoing commitment of the Ottoman government to economic and social development. The Rose Garden Decree declared that the sultan guaranteed the life, property, and honor of all Ottoman subjects and the equality of all before the law, regardless of religious affiliation. The decree also announced a system of conscription for the Ottoman Army and the abolition of tax farming, with a system of rational taxation to replace it.

The period from the issuing of the Rose Garden Decree by Sultan Abdulmejid I in 1839 to the suspension of the constitution by Sultan Abdülhamid II in 1878 is often referred to as the era of the Tanzimat ("Reorganization"). Political initiative for the changes in this era typically lay less with the sultans—Abdülmecid (r. 1839–1861), Abdulaziz (r. 1861–1876), Mustafa IV (r. 1876) and Abdülhamid II (r. 1876–1909)—than with the leading officials of the Ottoman civil bureaucracy, the "men of the Tanzimat." Hence the term "Sublime Porte" is often used as a synonym for the Ottoman government in this era. The term was a translation of Bab-ı Âlî, the name of the building where the offices of the Ottoman administration were housed, as contrasted with the palace, the residence, and offices of the sultan.

The ascendancy of the civil bureaucracy is evidence of the almost complete inability of the

Islamic ulema to provide leadership for the empire during this time. In an age calling for visionary thinking to meet new and unprecedented challenges, their obsolete intellectual preparation seemed to leave the ulema paralyzed. Even more surprising was the eclipse, for the moment, of the military leadership in directing the reform movement. The weak performance of the Ottoman military in the 1820s and 1830s showed up inadequacies not only of military administration but also of officer training, which would take two generations to reform. By 1876, Ottoman armies could defeat weaker Balkan states and, in the early stages of the Russian war in 1877, achieve moderate success against the Russian Army. It was not until the turn of the twentieth century, however, that a competent officer corps reemerged in the Ottoman empire.

Mustafa Rashid Pasha, a young career administrator who had served as ambassador to Paris, led the Council of Justice. A creation of Mahmud II, now revised, enlarged, and given consultative and quasi-legislative functions, the Council of Justice was led by the men of the Tanzimat who spearheaded the reform movement in its initial phase. Mustafa Rashid Pasha served as grand vizier six times before his death in 1858, and he or one of his protégés Ali Pasha and Fuad Pasha held the powerful post of foreign minister continuously until 1871 except for a brief period in the 1840s.

The Council of Justice began a reorganization of provincial government and revenue collection in 1840. Taxation was simplified. The main taxes, the tithe on Muslims, a poll tax on non-Muslims, and a group of other fees were to be collected by government officials; tax-farming, contracting, and franchising were abolished. Meanwhile a general conscription began, and the state sponsored the building of factories for the production of military supplies and clothing. Although direct taxation and conscription fell far short of expectations due to a shortage of trained officials, experimentation with ways of improving central control of the provinces—including a brief trial of a representative provincial council in 1845—continued until 1858.

Legal changes accompanied these efforts. A new penal code and a new commercial code were issued in the early 1840s. The commercial

code, revised periodically throughout the 1850s and 1860s, was designed to accommodate the economic and commercial liberalism of the Tanzimat. Commercial tribunals composed of mixed boards of judges, Muslim and Christian, including Europeans, administered it after 1847. The Ottoman Bank, founded in 1841, channeled European investment in the empire. In spite of its name, it was not Ottoman-owned.

The second phase of the Tanzimat era began with the Imperial Rescript of 1856, which reiterated the principles of 1839 and added some new measures. After the death of Mustafa Rashid Pasha in 1858, the dominant figures were his pupils Ali Pasha and Fuad Pasha. The Council of Justice continued to evolve, being at first divided into two bureaus in 1856, one a specifically legal body and the other called the High Council of the Tanzimat, with Fuad Pasha as president. The two bureaus merged in 1860 and then were once again divided in 1868, one becoming a nascent Ministry of Justice under the important scholar and jurist Ahmed Cevdet Pasha, the other a State Council on which sat both Muslims and Christians. Cevdet Pasha became the principal author of a new civil code, usually called simply the Mecelle, promulgated between 1869 and 1876. Cevdet represented a slightly different strain of Tanzimat thinking, being less apt to distinguish imperial law from Islamic law than Rashid Pasha, who had once responded to a question about the relationship of his civil code to Sharia (Islamic holy law) that “this has nothing to do with sharia.” Significantly, he had titled the 1840 penal code *kanun*, evoking the classical Ottoman ideology of the parallel authority of Islamic and sultanic law. Cevdet’s interest was in exploring the integration of faith with various aspects of imperial life. Under his authorship, the Mecelle was essentially a codification and rationalization of Islamic law for imperial purposes. It laid the foundation of all subsequent Ottoman, Turkish, and Middle Eastern legal reform.

The status of non-Muslims in the empire became increasingly ambiguous during the era of the Tanzimat. In pursuit of the aim of the equality under the law of all Ottoman citizens, the Imperial Rescript of 1856 abolished the poll tax

on non-Muslims. Now non-Muslims were subject to military conscription, but they could pay an exemption fee, which became essentially the equivalent of the old poll tax.

The Young Ottomans

The Young Ottoman movement, which consisted of a loose coalition of Muslim intellectuals and literary figures, arose between 1865 and 1867 in response to the failure of the Tanzimat reforms. These mid-nineteenth-century reforms aimed at liberalizing and modernizing the Ottoman state to prevent the continuing European economic and military penetration of Ottoman lands. Young Ottoman thinkers wanted to combine state-strengthening Tanzimat reforms with Western political ideas and Islamic political traditions. They believed that Islam was compatible with modernization and protested against what they perceived to be the insular inner circle that controlled the Ottoman empire.

Although the Young Ottomans wanted to adopt certain Western political ideas, they believed that such reforms must respect Islamic tradition. Therefore, they did not call for democracy or the cessation of the sultanate. Rather, they argued that Islamic tradition called for

consensus and consultation between the sultan and his top Islamic advisers. They also called for a constitution that would provide checks on the sultan's absolute power and bring the empire more in line with their perceptions of a proper Islamic state. In this way the Young Ottomans hoped to force the sultan to consider the opinions of Islamic thinkers outside his household.

The most important Young Ottoman thinker was Namik Kemal (1840–1888), a poet and journalist. Kemal called for greater equality between men and women in the context of Islamic tradition and also was one of the first advocates for Pan-Islamism. Later thinkers adopted his concept of Pan-Islamism and argued that the Muslim world needed to unite, if not politically then at least in spirit, against Western encroachments on their sovereignty. Kemal and his Young Ottoman colleagues were aided by the spread of newspapers in the Ottoman world during the 1860s, a development that allowed them to disseminate their ideas.

Many Young Ottoman thinkers were forced into exile in Europe in the late 1860s because of their antigovernment sentiments. Although they were allowed to return in the early 1870s, their movement had been stifled. In reality, they had never threatened to gain actual political power. While Young Ottoman thinkers, including Kemal, took part in the constitutional assemblies in the 1870s, their ideas were drowned out by other voices, who also wanted a constitution but disagreed with the path that the Young Ottomans envisioned. The Ottoman sultan Abdulhamid II allowed the creation of a constitution in 1876, but it lacked the specific Islamic emphasis that the Young Ottomans had demanded and was, for all intents and purposes, suspended within two years.

The Young Ottomans were the first serious intellectual Ottoman group that protested against the inherent weaknesses of the Tanzimat reforms. Although they never gained political power, they had a great influence on later Ottoman history. Their emphasis on maintaining the territorial integrity of the Ottoman empire later impressed Young Turk thinkers, while their ideas on Pan-Islamic solidarity influenced later figures such as Jamal ad-Din al-Afghani (1838–1897)

and Muhammad Abduh (1849–1905). One of the main weaknesses of Young Ottoman thought was its inability to harmonize the emphasis on Islamic solidarity with Ottoman nationalism. Thus, later thinkers adopted some of their ideas but looked for other nationalist ideas to ensure the survival of the Ottoman state.

The Era of Abdulhamid II

The era of Sultan Abdulhamid II (r. 1876–1909), the last sultan to wield absolute power in the Ottoman empire, represented in part a continuation of the reforms initiated in the Tanzimat era during the reigns of Mahmud II and Abdulmejid I. It also, however, represented a departure for the era of reform. Abdulhamid II's reign built on the Tanzimat by continuing to guarantee citizens' rights, regardless of religious affiliation, and strengthening the power of the state over the provinces. It also continued many of the earlier efforts to modernize the Ottoman economy and military. This era saw a break from the recent Ottoman past, however, in the sultan's emphasis on the Islamic aspect of Ottoman society and his rejection of constitutional reform.

Abdulhamid II assumed the sultanate in the tumultuous year of 1876, when no fewer than three different sultans held the throne. During the brief reign of Murad V, who was forced out of office in August because of a nervous breakdown, Ottoman reformers under the direction of Grand Vizier Midhat Pasha had written a constitution for the empire that included a provision for an elected parliament. Abdulhamid II at first supported the constitution, but in 1877 after the first parliament met for a few weeks, the sultan adjourned it and suspended the constitution. His rejection of constitutionalism paved the way for

four decades of autocratic rule but tarnished his image among intellectuals and reform-minded army officers.

During Abdulhamid's reign the Ottoman empire became less diverse and more Islamic. Following a disastrous war against the Russian empire and the political settlement of the Treaty of Berlin in 1878, the Ottomans were deprived of most of their European Balkan provinces. The result was that the Ottoman empire lost most of its Christian subjects and became a predominantly Islamic empire. Partly for this reason, the sultan began to emphasize his role as caliph, or leader of the worldwide Islamic community. Although his predecessors had viewed the title of "caliph" as minor and basically honorific, Abdulhamid, a devout Muslim, viewed the new emphasis on his role as caliph as a way of gaining support from his Muslim subjects and thereby strengthening his rule. Although this policy was a reversal of the secularism of the Tanzimat era, in other respects Abdulhamid's reign saw the weakening of certain Islamic traditions. Girls, for example, gained access to the public schools created during his reign, and approximately one-third of all girls were attending primary school by 1900. In addition, in the major cities upper-class women began wearing lighter, thinner veils in public.

Abdulhamid faced a severe financial crisis in the 1870s when the Ottomans were unable to make payments on the government's foreign debts. Defaulting was not an option, both to avoid humiliation and to continue to attract the investments needed to maintain the government's programs for military reform and economic development. Thus, in 1881 the Ottomans accepted the Ottoman Public Debt Administration, which was European-run, and ensured that Ottoman revenue was first and foremost used to repay European loans. Although this saved the Ottoman state from bankruptcy, it was an embarrassment to many Ottoman subjects and a painful reminder that European powers had come to dominate much of the Ottoman economy.

The Ottoman state made substantial economic progress during the reign of Abdulhamid II. A major goal of the administration was railway construction, much of which was financed and controlled by Europeans, but the Hijaz railroad, which linked Syria and western

Arabia, was financed by the Ottomans themselves. Despite such examples of economic progress, the perceived weaknesses of the Ottoman state and the suppression of the Constitution of 1876 resulted in growing opposition to Abdulhamid's rule, with the Young Turks becoming the most important opposition group. The Young Turk movement, which began in 1889, initially attracted the support of young professionals and military men who believed that Abdulhamid's oppressive rule was stifling Ottoman development. The Young Turks also were concerned with further divisions within the Ottoman state and fiercely opposed nascent Armenian nationalism. After being forced underground during the 1890s as a result of government oppression and harassment, the Young Turks gained prominence in the early years of the twentieth century, establishing a political organization known as the Committee of Union and Progress in 1906. Young Turk leaders gained positions of command throughout the Ottoman military, most notably in Ottoman Macedonia. Following Abdulhamid's refusal to reinstate the constitution in 1908 amid Young Turk threats, the Macedonian Army marched on Istanbul. Abdulhamid II restored the constitution but was deposed the following year, effectively ending the approximately 600-year period of near-absolute rule, at least in theory, of the Ottoman sultans.

Napoleon in Egypt

In 1798 Napoleon Bonaparte and his troops landed in Egypt, forever changing Egypt's political history and adding fuel to the British-French military, economic, and political rivalry. Bonaparte's army was accompanied by a group

THE ROSETTA STONE

One of the most famous finds of Bonaparte's soldiers was the large basalt Rosetta Stone, discovered by accident in 1799 while soldiers were digging the foundations for a fort. In 1801 the stone became British property and was installed in its current home in the British Museum. The French were only allowed to keep a copy of the stone.

The inscription on the stone, composed around 200 BCE, is written in Greek, Demotic (a cursive Egyptian script), and hieroglyphs. While scholars could easily read Greek, knowledge of hieroglyphs had been lost.

Two individuals, Thomas Young and Jean-François Champollion, raced to become the first to be able to read and understand the ancient Egyptian hieroglyphs. The victory went to the Frenchman. In September 1822 Champollion realized that the Egyptian royal names were encircled within a cartouche (an oblong enclosure with a horizontal line at one end), allowing him to compare the names in the Greek and hieroglyph sections. This enabled him to understand the phonology of the hieroglyphs. From there, he applied his knowledge of Coptic (the latest stage of the Egyptian language) to create a rudimentary but monumentally important grammar of ancient Egyptian.

According to legend, Champollion went sleepless for several days working on the decipherment, then burst into his brother's office the morning of September 14 to announce, "Je tiens l'affaire! [I've got it!]," before collapsing and remaining in bed for nearly a week. Although he died in 1832 at the age of 42, his contributions to Egyptology were immense. Once Egyptian hiero-

The Rosetta Stone, found by Napoleon I's soldiers in 1799 and later translated by Jean-François Champollion, was the key to deciphering Egyptian hieroglyphics. It has the same passage inscribed in Greek, Egyptian demotic, and Egyptian hieroglyphics. (Jupiterimages)

glyphics were understood, the study of ancient Egypt made rapid strides.

—Tracy Musacchio

of approximately 150 savants—scientists, engineers, naturalists, physicians, and artists—who as a reflection of Bonaparte's Enlightenment ideals were given the task of studying Egyptian topography, culture, and ancient monuments. Militarily, the French three-year expedition into Egypt ended in defeat for Bonaparte, but his career thrived nonetheless. In addition, the French cultural legacy in Egypt and its impact on the study of Egypt by the West endure.

The reasons for Bonaparte's invasion of Egypt were both political and personal. Ostensibly, the

Directory (the five-man executive board that held executive power in France between 1795 and 1799) approved Bonaparte's invasion of Egypt because the Isthmus of Suez and the Red Sea provided strategic access to India, where Great Britain had established its political authority since the 1750s. The French also envied Britain's overseas holdings and considered Egypt a potentially profitable economic base for trade in the Middle East. For his part, Bonaparte, only 28 years old in 1798, anticipated that such an endeavor would bolster his image and further

his career at a time when his successful Italian campaign was winding down. Finally, Bonaparte recognized Egypt as a powerful symbol: having been a colony of the Roman empire, French control of Egypt would be a metaphor of imperial strength.

Egypt at the time of Bonaparte's arrival was a part of the Ottoman empire but was ruled by the Mamluks (a military group who had seized power in Egypt in the thirteenth century), and it would be the Mamluks, still perceived by many Egyptians as foreigners despite several centuries of control, whom Bonaparte would have to defeat. Bonaparte arrived in Alexandria on July 1, 1798, having briefly stopped en route in Malta to claim it for the French. Alexandria fell within a few hours of the French arrival, and his troops advanced toward Cairo. Once there, they met the Mamluks in two crucial battles in July: the Battle of Shubrakhit on July 12 and the Battle of the Pyramids on July 21. The Mamluk troops had no experience with square battalions like those of the French army and were no match for Bonaparte, who tested his skills against the Mamluks at Shubrakhit and subsequently won a resounding victory at the Pyramids.

Bonaparte's success was short-lived, however. Not two weeks after the Battle of the Pyramids, the French met the British in naval combat at the Battle of the Nile. The British, under the leadership of Horatio Nelson, had pursued the French from Italy to Malta and finally caught up with them in Egypt on August 1 near Abu Qir Bay. The two sides battled overnight; by the morning of August 2, the British had won a decisive victory in a battle in which 1,700 French sailors lost their lives. Four French ships escaped, but the remaining ten were either captured or were destroyed by fire.

Learning of the French defeat, the Ottoman sultan Selim III saw this as a chance to attack the weakened French forces in order to reassert his authority over Egypt. He sent two armies to Egypt, and in response Bonaparte headed north into Syria with nearly 13,000 troops. The two sides met at Jaffa, a city on the Mediterranean coast in present-day Israel. The French besieged the city and brought it under French control in early March. After making the controversial decision to execute several thousand enemy troops,

Bonaparte ordered his troops to advance toward the Ottoman fortress at Acre. Bonaparte's troops, weakened by hunger, abnormally wet and cold weather, and a plague epidemic, conducted seven large-scale assaults but were unable to take the fortress. After a failed assault on May 10, Bonaparte ordered a retreat. To hasten the retreat, he abandoned approximately 2,000 of his wounded or plague-stricken men. Two thousand more died in the retreat to Egypt. By the time he returned to Egypt, he was increasingly focused on the political situation in France. In August 1799 he returned to France, and in November he led the coup that overthrew the Directory and elevated him to first consul.

Bonaparte from the outset had conceived his invasion of Egypt as a military and scientific venture. The savants who accompanied him organized their mission into the Commission des Sciences et Arts d'Égypte, which later became the foundation for the Institut de l'Égypte (modeled after the Institut de France, France's premier learned society). The Institut de l'Égypte was made up of four sections: mathematics, physics, political economy, and literature and art. In addition to aiding Bonaparte and his troops in practical matters of warfare, including mapmaking, they collected data on Egypt's monuments (modern and ancient), people, customs, flora, and fauna. Their masterwork was *Description de l'Égypte*, which fueled an eager European public's desire for detailed and accurate information on the exotic Orient. The *Description* was a massive undertaking, resulting in the publication of nine volumes of text, ten volumes of plates, and one volume of description of the plates between 1809 and 1826. The *Description* was later published in several different editions ranging from 20 to 37 volumes, all of which are notable for their beautiful and detailed engravings and some of which are notable for their size: one edition measures 39 inches by 31 inches (99 centimeters by 79 centimeters). Although the decipherment of hieroglyphs rendered many of the text volumes obsolete, Egyptologists today still consult the *Description* for its accurate depictions of the temples and monuments as they were before European looting removed, damaged, or destroyed many of the antiquities.

The cultural impact of the French invasion was still felt years after Egypt gained its independence. For instance, France created and maintained Egypt's antiquities service (well into the twentieth century) to control and regulate ancient artifacts as well as modern archaeological expeditions, all of which were conducted by foreign missions. In another example, Egyptian civil laws today are still based on French codes. While Bonaparte may not have achieved his immediate military goals in Egypt, his legacy has been long-lasting.

Modernization in Egypt— Muhammad Ali and Ismail

Muhammad Ali, an Ottoman soldier from Albania, first came to Egypt with an Ottoman-British force sent to end the 1798–1801 French occupation. He obtained Ottoman approval to rule Egypt in 1805 and consolidated his control such that his heirs were in power through 1952. Muhammad Ali's rule of Egypt marked the start of almost 80 years of state-led modernization, continuing through his grandson Ismail's deposition in 1879.

Muhammad Ali was a transitional figure, as he is the father of modern Egypt, yet in many ways also a Turkish-speaking Ottoman-style ruler. He ended Mamluk rule and influence and aimed to make Egypt as independent as possible from both Ottoman and European forces. This required a European-style army and the revenue to support it. He significantly limited or abolished tax farms and *waqfs* (religious endowments) and created a state monopoly on the sale of agricultural goods. He founded a number of

factories and boosted agricultural production by introducing long-staple cotton and carrying out irrigation projects.

Education was central to Muhammad Ali's reform efforts, as he needed military officers and civil servants with new skills. He created a system of civil schools to run in parallel with existing religious schools to produce graduates with the mathematics and science skills necessary for careers in the army and administration. He also created a military academy (1821) as well as advanced schools for administration (1829), medicine (1829), surveying (1816), midwifery (1832), technical training (1834), and language and translation (1835). These schools were supported by a secondary school (1825) and several primary schools (1833) that provided a limited number of students with preliminary training. He also instituted legal reform, bringing civil law codes and courts into existence alongside traditional Islamic Sharia courts.

Muhammad Ali's reformed army and navy were called into service by the Ottomans during 1811–1818 in the Hijaz against the first Wahhabi-Saudi state, and during 1822–1823 and 1825–1828 in Crete, Cyprus and mainland Greece in opposition to Greek rebellion against Ottoman rule. He held the Ottomans responsible for the complete destruction of his navy at Navarino in October 1827, and eventually negotiated a withdrawal from Greece with Britain in 1828 against Ottoman wishes. He subsequently ordered the invasion of the Ottoman province of Syria in 1831. Egyptian forces returned to Sudan, subject of an 1820–1821 campaign, in 1840 and 1846.

European powers, who sought to preserve the territorial integrity of the Ottoman empire, were uneasy about Muhammad Ali's reforms. After the Ottomans failed to drive the Egyptian army out of Syria, the European powers intervened to force Egyptian troops to leave, which they did in 1841. Muhammad Ali was subsequently forced to pull out of the Hijaz (but not the Sudan) and limit the size of his military, but his family rule over Egypt within an Ottoman framework was guaranteed. This led to a significant scaling back of internal Egyptian reform, as Muhammad Ali was also forced to recognize the terms of the 1838 Anglo-Turkish Convention, which forbade monopolies and lowered import

THE SUEZ CANAL AND EGYPTIAN BANKRUPTCY

Construction of the Suez Canal appreciably affected Egyptian affairs in the nineteenth century. Said Pasha granted Frenchman Ferdinand de Lesseps the right to build a canal across the Suez isthmus in 1854 and gave his Suez Canal Company a 99-year lease on the land for the canal in 1856. The project's success was initially uncertain, as Britain initially attempted to block its construction, while others were certain that it would never turn a profit. Its construction ran for 10 years (instead of the predicted 7 years), starting in 1859. Khedive Ismail spent lavishly to impress European dignitaries at its opening in November 1869.

The canal's construction was costly, despite the initial use of Egyptian forced labor, and came at a time when Egypt's debt was mounting. Egypt did not draw lasting benefits from its investment because the canal did not turn a profit for its shareholders until 1872, and financial difficulties led Khedive Ismail to sell all of Egypt's shares to Great Britain for only 4 million pounds in 1875.

Given the increasing profitability of the canal, Britain drew significant benefit from its investment. Protecting its strategic interest in the canal as a route to India was one factor behind Britain's 1882 military intervention in Egypt, an action that reduced it to semicolonial status in 1882.

—Hilary Kalmbach

duties, thereby significantly decreasing state revenue and quashing local industry.

Foreign influence in Egypt increased significantly throughout the nineteenth century. Despite the restrictions placed on Egyptian economic and military growth after 1841, Muhammad Ali significantly limited state debt and foreign influence for most of his reign. His successors were less successful and were eventually forced to cede economic and then political control to Europeans in the late 1870s and early 1880s.

Ibrahim Pasha took over the reins of government from his senile adopted father in 1848 but died in the same year and was replaced by a grandson, Abbas Pasha. While Abbas neglected his grandfather's reformist agenda, he did give a British engineer a concession to create rail links between Alexandria and both Cairo and Suez. Muhammad Said Pasha, one of Muhammad Ali's

younger sons, took over in 1854 and is most remembered for giving Ferdinand de Lesseps the Suez Canal concession. While this concession enabled a major development project, it ended up contributing to Egypt's loss of financial and political independence.

Ismail Pasha, Muhammad Ali's grandson through Ibrahim, came to power in 1863 and launched social, economic, cultural, and administrative reforms. Ismail laid out a major new quarter in Cairo between the Islamic city and the Nile River, significantly improved public works (mainly in the new quarter), and reestablished and expanded Muhammad Ali's educational projects, all with the help of Minister of Education and Public Works Ali Mubarak Pasha. Under Ismail's rule the Suez Canal was completed, a postal service was instituted, new sugar and textile factories were built, and the railroad and telegraph networks were expanded.

Ismail returned from Paris's Universal Exposition of 1867 determined to transform Cairo into a modern city before the grand opening of the Suez Canal. He mapped out new streets using a grid system, planned several arteries that would cut through the fabric of the old city (only one was completed), and built both an opera house and a new road to the Giza Pyramids. With respect to education, Ismail reinstated the Ministry of Schools, revamped the civil higher education system, and vastly expanded civil primary and secondary schools in order to increase the number of students qualified to enter the higher schools.

Ismail also sought to increase Egyptian territory and sovereignty. He launched military campaigns in Sudan, Ethiopia, and Uganda. His extravagant spending was not only aimed at impressing Europeans but also was directed at Ottoman officials, who gave Ismail greater independence (including a larger army and the right to negotiate with Europeans on commercial and financial matters), the title of "khedive," and a new succession law based on primogeniture. Expanding his influence through bribery instead of military might, as Muhammad Ali had done, only decreased Egyptian independence in the long run.

Ismail's massive projects ground to a halt as Egyptian debt, which had begun to increase

under Abbas and spiraled under Said and Ismail, mounted in the 1870s. A European commission seized control over Egyptian finances in 1876 and 1878 and forced Ismail to retire in favor of his son Taufiq in 1879.

The state-led modernizations of 1805–1879 laid the groundwork for the society-driven modernization of the subsequent 50 years. The military, educational, and administrative reforms of this period gradually brought native Egyptians into the highest levels of government service and created an Arabic-speaking Egyptian middle class alongside the Turkish-speaking elite. This new educated group would play a major role in subsequent modernizations, nationalist movements, and the *nahda*, or renaissance, of Arabic language and thought. The transition of power between Turkish and Arabic-speaking groups was not entirely smooth, however, as shown by the role of disgruntled Arabic-speaking army officers in the 1881 Urabi Revolt.

British Colonialism in Egypt

Technically part of the Ottoman empire, nineteenth-century Egypt enjoyed de facto independence since Muhammad Ali (1769–1848) became its viceroy in 1805. Under his grandson Ismail (1830–1895), the nation accumulated a tremendous foreign debt that peaked at £91 million in 1875. Even after negotiations reduced this amount, Ismail had to allocate 66 percent of

government revenues to paying back European banks and bondholders.

Desperate for ready cash, Ismail sold Egypt's share of the newly opened Suez Canal to Great Britain in 1875. This was hardly enough to cover even a year of expenditures but greatly increased England's interest in Egypt. Four years later, in 1879, Britain and France forced Ismail to accept Dual Control, under which a British and French administrator supervised the collection and disbursement of all Egyptian revenues. His resistance to this loss of sovereignty led to Ismail's replacement by his son Tewfik (1852–1892) during the same year.

Under Tewfik, Egypt sought to appease the Great Powers by paying down the debt as quickly as possible. This entailed massive cutbacks in government spending and a significant increase in the number of French and British “advisers” to the Egyptian government. A nationalist reaction fueled the rise of the army officer Ahmad Urabi (1841–1911), whose 1881 coup briefly established a new government. As crowds yelled “Egypt for the Egyptians” and with Urabi's regime suggesting renegotiation of the debt, Britain intervened, landing troops at Alexandria and Suez.

Urabi's “revolution” ended when the Egyptian army was defeated by a larger British force at Tel el-Kebir (September 13, 1882). Foreign rule ensued, with England dominating Egypt from September 1882 until June 1956. The period of 1882–1914 is often referred to as the “veiled protectorate,” when Britain controlled Egyptian affairs behind a screen of Egyptian politicians and civil servants. This “veil” lifted at the beginning of the Great War, when Great Britain openly declared its domination of Egypt.

The “veil” provided useful diplomatic cover for England, as France, Italy, and Germany sought a diplomatic rationale to inject their own authority over Egypt. Outright colonial status for Egypt, without the support of at least one other Great Power, would have placed Britain in a difficult position. The fiction that Egypt was still part of the Ottoman empire and that British officials were simply advisers allowed room to maneuver in the complex world of late-nineteenth-century diplomacy. It also diffused local opposition, thus necessitating a garrison of only 5,000 soldiers.

► THE DINSHAWAY INCIDENT

Many European colonial officials were devoted sportsmen. Hunting was especially popular and was viewed not only as a source of enjoyment but also as a way to improve shooting and riding skills. British military men were no exception; their memoirs seldom omit references to their hunting exploits.

The Egyptian garrison focused on bird hunting, which explains why four or five British officers were shooting pigeons near the village of Dinshaway (Denshawai) on June 13, 1906. Either unaware or uncaring, the group managed to kill pigeons kept by the villagers as a source of meat, eggs, and manure and also set fire to grain on the threshing floor. The villagers had already lost pigeons to another hunting party and, brandishing clubs, confronted this group. The officers opened fire, wounding a woman. Overwhelmed by the large crowd, several officers attempted escape.

Captain Seymour Bull, already wounded, ran until he died from sun stroke or heat exhaustion. An Egyptian peasant who came to the aid of Bull was shot when discovered by British troops, who presumed that he had murdered the Englishman.

Evelyn Baring, the British proconsul, already bothered by nationalist complaints, overreacted and demanded stiff penalties for what he saw as calculated violence against the British occupation. Arrests followed by a special tribunal resulted in 4 villagers executed and 2 sentenced to life imprisonment, while the remaining 46 received jail time or flogging.

Egyptian reaction was swift, uniform, and angry. The Dinshaway incident united town and country, elites and farm labor, Coptic Christian and Muslim, against the British occupation.

—John Dunn

Britain's success is also attributed to a string of energetic proconsuls: Evelyn Baring, Lord Cromer (1841–1917); Eldon Gorst (1861–1911); and Horatio Kitchener (1850–1916). Challenged with paying off the debt by cutting government expenditures while supporting economic expansion and maintaining order, this trio was markedly successful. The three men focused on expanding agricultural production through improved irrigation plus a strenuous anticorruption campaign. By 1889 the Egyptian government produced a surplus; six years later this reached the very considerable figure of £1 million. The debt crisis was over.

Despite economic improvement, Britain's hold over Egypt was never popular outside select financial circles and certain non-Muslim groups. Egyptian Muslims were at best neutral and more frequently were hostile. Native opposition to British domination centered on Abbas II Hilmi (1874–1944) and his protégé, Mustafa Kamil (1874–1908). The former was Egypt's khedive, heir to Tewfik, but very much under the thumb of Baring, Gorst, and Kitchener. The latter, an up-and-coming lawyer, became a powerful nationalist leader and editor of a popular newspaper, *Al-Liwa* (The Standard).

Egyptian nationalists were drawn mainly from the ranks of the Egyptian elites: educators, lawyers, writers, and government officials. While divided by competing visions for an independent Egypt, most could agree on the need to end British control. Mustafa Kamil argued this was best accomplished via nonviolent opposition and diplomacy. The latter tactic involved seeking support from France. After 1904's Entente Cordiale, when Britain swapped its interests in Morocco for a similar cession of French interests in Egypt, the focus shifted to the Ottoman empire.

In a peculiar move for a nationalist leader, Mustafa Kamil convinced his supporters to side with Ottoman authorities over the Taba boundary question (1906), even though Ottoman success would take Egyptian territory. Mustafa Kamil argued that opposing the boundary that the British supported was an act of solidarity with fellow Muslims that was worth the cost of some Sinai desert. Other Egyptian nationalists, unwilling to travel that road, formed rival political groups: the Party of the Nation and the Constitutional Reform Party. Mustafa Kamil's own Nationalist Party survived Taba but not his death, splintering over leadership issues.

Divided over foreign policy, Egyptian nationalists were also split on the position of Abbas II, who had reduced his support for nationalists while becoming more accommodating to the British. Both Gorst and Kitchener fueled this division, allowing limited political power to a Legislative Assembly that they hoped would pit the *khedive* against nationalists. The assassination of pro-Abbas prime minister Butros Ghali (1846–1910) made this separation violently clear.

Arab Nationalism before 1914

Arab nationalism before 1914 is best highlighted by the major contributors to its formation and articulation. These contributors include Muhammad Ibn Abd al-Wahhab (1703–1791), who is considered the father of Wahhabism. He sounded a call for the Arabs to rise up and restore the original purity and prominence of the Arabic-based religion. Muhammad Ali (1769–1849) and his son Ibrahim Pasha (1789–1848) sought to establish an Arab-based state in the regions of Egypt and the Levant after Napoleon's 1798 invasion of Egypt. Napoleon's invasion, though ultimately failing to establish French rule, had broken Ottoman hold over the region, making way for Ali and Pasha to assert their rule.

The writings of the French-educated Egyptian Rifa'a al-Tahtawi (1801–1873) express aspirations for the development of Arab identity. The

Syrian-Lebanese Christian Nasif Yazeji (1800–1871) drew inspiration for an Arab vision from classical Arabic literature. The Persian-Afghan scholar Jamal ad-Din ad-Afghani (1839–1897) and his disciple Muhammad Abduh (1849–1905) together coedited the modernist-oriented journal *Al-Urwa Al-Wuthqa* in Paris as a mouthpiece of Islamic and Arab renewal. The Syrian Rashid Rida (1865–1935) argued for the special status of the Arabs as leaders in the Islamic world. Abd al-Rahman al-Kawakibi (1849–1902) was, like Rida, a Syrian Muslim. Al-Kawakibi lived his final four years in Egypt, ultimately contributing two widely referenced volumes calling for Arab ethnic, cultural, and linguistic unity as distinguished especially from the Turks. Those volumes were *Taba'i al-Istibdad (The Characteristics of Tyranny)* and *Umm al-Qura*, with the latter being an alternative name for Mecca. Finally, Negib Azoury (d. 1916), an Ottoman Christian who studied in Paris, echoed arguments similar to those of al-Kawakibi in *Le reveil de la nation arabe (The Awakening of the Arab Nation)*.

The distinguishing features and emphases of Arab nationalism in the pre-1914 period can be further drawn out by focusing on the change in historical conditions that occurred for the Arab peoples with the onset of World War I. The outcome of the war resulted in the division of the Arab domains of the Ottoman empire among Britain, France, and Italy. Just before the outbreak of the war, Arab nationalist political leaders and intellectuals foresaw these impending political changes and became concerned over their implications for Arabs. This concern was given lucid expression in 1913 at the first Arab Congress in Paris, where delegates asserted their need to break from Ottoman dominion.

There were four primary reasons for this shift in political thinking among Arab nationalists. First was the failure of the Ottomans to protect the Arabs from the imperial ambitions of the West European powers. The second reason was the attempt of the Ottoman Turks to save the empire by asserting centralized control under the Committee of Union and Progress. This centralization occurred despite the 1839 and 1856 Ottoman edicts promising rights of equality to all peoples under their domain and resulted in significant restrictions on Arabs and

➤ SAYYID JAMAL AD-DIN “AL-AFGHANI”

Jamal ad-Din al-Afghani (1838–1897), was born into a Turkic-speaking Shia family in Persia. After theological training there, in 1855 he traveled to India, where he witnessed—then nearly 20 years of age—the 1857–1858 uprising of Indian nationals against British imperialism. This served as a foundational experience that shaped his lifelong vision of Pan-Islamism and his hope of uniting all Muslims against the Western imperial powers, who were increasingly intruding into Middle Eastern affairs during the course of the nineteenth century. Al-Afghani’s ideas and efforts subsequently influenced anti-imperialist movements across the Muslim Middle East, including those of Egypt, Turkey, and Iran and reaching even into the Russian empire. He appears to have been a determined, charismatic figure who found audiences among sultans, kings, and other national and religious leaders. His zeal for his cause brought him into regular conflict with many dignitaries and clergy, leading to his expulsion from Ottoman domains in 1871, Egypt in 1879, and Persia in 1892, when he was placed half-naked on horseback in midwinter and sent off to die. He somehow survived and returned to the Ottoman court, where he lived out his days as a guest of Sultan Abdulhamid II, stirring up opposition against the shah of Iran from afar and contributing to the Ottoman Pan-Islamic cause. Al-Afghani died of cancer at approximately age 60, and his burial place, although believed to be in Istanbul, was never disclosed. In 1944 what are thought to be his remains were transferred to Afghanistan at the request of the Afghan government, which awarded him official status as a national hero.

—R. Charles Weller

other non-Turkish groups within the empire. Third, the centralization efforts were accompanied by a rise in Turkish nationalism and an assertion of Turkish linguistic and cultural domination. Fourth was an increasingly perceived need among the Arabs to restore Islamic purity as well as social and political integrity through their own leadership in the face of what they saw as Turkish-led Ottoman corruption and failure; the Arabs tended to view themselves as the

original recipients of and thus proper guardians of the Arabic-based religion. This thinking was especially manifest in Wahhabism. Whatever the precise factors leading up to the shift in political thinking, Arab aspiration for independence only intensified with the shift from Ottoman to West European dominance in the region after World War I.

Most scholars suggest therefore that until the outbreak of World War I most Arab nationalists envisioned Arab nationhood more along linguistic-cultural lines, seeking to promote its development within the political framework of the Ottoman empire. If this interpretation is correct, it would mean that until the Ottoman empire began to crumble through the encroachment of the European powers in the late nineteenth century, the majority of Arab nationalists supported Ottomanism as part of their vision for Arab nationhood as opposed to calling for political secession and the founding of some type of Pan-Arab state. This support for developing the Arab nationalist agenda within instead of outside the framework of the Ottoman empire was based in both pragmatic social and political reasons as well as the fact that both the Arabs and Turks shared the Islamic faith.

The Arab nationalist movement must nonetheless be viewed in close connection to other nationalist independence movements within the Ottoman empire in the pre-1914 era. These nationalist independence movements included those in southern Greece, Bulgaria, Montenegro, Romania, and Serbia, all of which had broken free from Ottoman rule by 1878. Viewing the Arab nationalist movement in this broader context would support a more political interpretation (as opposed to ethnic or religious motivations) of Arab nationalism in the pre-1914 era. Indeed, traces of political nationalist thought are discernable among the foundational contributors to Arab nationalism highlighted above. Be that as it may, the question of how explicitly they framed and expressed their political aspirations in the pre-1914 era forms a central point of debate over whether those figures and their contributions should be technically defined as nationalist or not. Opinion on that question remains divided.

Armenians in the Ottoman Empire

Armenians lived in the religiously, ethnically, and linguistically diverse Ottoman empire from the fifteenth to the twentieth centuries in relative peace and security as one of the empire's four main autonomous communities, known as *millet*s. Before the eighteenth century, the Armenian community was headed by the patriarch in Istanbul, who had legal autonomy and authority over the Armenians in the empire. Armenians were mostly peasants integrated with Muslims and non-Muslims (mainly Turks and Greeks) and inhabited the same towns and villages all over Anatolia. Their position began to change in the eighteenth century when growing numbers became bankers, purveyors of luxury goods, and long-distance traders. A wealthy class of people called *amiras* then emerged and challenged the traditional leadership of the Armenian community. Another challenge came from the Mekhitarist Catholic religious order aimed at the development of education and culture among Armenians under Turks. These two groups initiated an Armenian cultural revival.

The changes in the traditional structure of the Armenian community were in fact part of the changes in Ottoman society at large under the influence of Europe. The French Revolution

and the rise of nationalism inspired similar nationalist sentiments among Ottoman ethnic minorities, while European industrialization and growing military power pointed out the need of the Ottoman state to reform its administration and laws. Such reforms heightened expectations among the empire's minorities, including the Armenians.

A series of reforms was undertaken by the Ottoman government in the nineteenth century to keep the empire strong and united. The Imperial Rescript of 1839, issued by Sultan Abdulmejid, marked the beginning of the period of reform known as the Tanzimat Era (1839–1876) and also the beginning of the Armenian national awakening. Armenians were allowed to serve in the Ottoman public administration and enter Ottoman administrative and professional schools, such as the Imperial School of Administration, medical schools, and veterinary schools. These schools gave Armenians the opportunity to gain new professions and skills, engage in public affairs, and improve their social standing.

The Imperial Rescript of 1856, also issued by Sultan Abdulmejid, promised to all Armenians and other non-Muslim communities various immunities and privileges. The result was the Code of Regulations, a document drafted mainly by educated Armenians influenced by nationalist ideas and put into force in 1863 to form the basis of the political structure and representation of the Armenian community. Other non-Muslim communities, including Greeks and Jews, also had their own regulations. The regulations recognized the right of all members of the community to have a voice in determining its affairs, circumscribed the powers of the patriarch and other community rulers, and granted greater educational access to ordinary people. The regulations also institutionalized a high degree of autonomy for Armenians and thus provided further momentum to the Armenian nationalist movement. After 1863 Armenians began to make demands for further rights and privileges, which the Ottoman state was unable or unwilling to meet.

Armenians made short-term gains in the Constitution of 1876, which provided for Armenian

ARMENIAN NATIONAL CONSTITUTION

The first efforts to draft an Armenian National Constitution were rooted in the Reform Decree of 1856, which conferred a range of freedoms and privileges on all subjects of the Ottoman empire. A special committee of Armenian intelligentsia made up of educated nationalist Armenians drew up a draft regulation in 1856. It was not, however, accepted by the Ottoman government, which found the regulation too liberal and said that “no state can be within another state.” After some revisions the government approved the constitution in 1860. Although Armenians called the new regulations the “National Constitution,” Ottomans called it the “Code of Regulation of the Armenian Community.” The regulation defined the powers of the patriarch and the newly established National Assembly and stimulated education, which contributed a great deal to awakening national conscience among the younger generation.

The regulation was abolished by Sultan Abdulhamid II in 1896 due to an Armenian rebellion but was restored in 1908 by the Young Turks and was valid until the establishment of the Turkish Republic in 1923. The regulation is still used by the Armenian communities in diaspora, particularly for religious issues.

—Fatma Acun

representation in the multiethnic Ottoman parliament, where they could voice their demands and join the administration. However, the constitutional era lasted only two and a half years, and the parliament was dissolved. Another turning point in Armenian-Ottoman relations was the Congress of Berlin (1878), a meeting of European diplomats and statesmen called by German chancellor Otto von Bismarck to reconsider the treaty arrangements following the Ottoman defeat in the Russo-Turkish War (1887–1888). The meeting provided a forum for the Armenians to present their demands to a European audience. Although the delegates ignored most of the Armenians’ specific demands, Article 61 of the Treaty of Berlin stated: “The Sublime Porte [Ottoman government] undertakes to carry out, without further delay, the improvements and reforms demanded by local requirements in the

provinces inhabited by Armenians. . . . It will periodically make known the steps taken to this effect to the powers, who will superintend their application.”

After the congress, European powers (mainly Russia and Britain) increasingly became involved in the protection and freedoms of the Ottoman Armenians, which strengthened the Armenian independence movement. Despite financial difficulties, the Ottomans implemented many of the promised reforms, such as building new schools, roads, and bridges and improving security and living conditions. Life in the eastern provinces improved. However, the changes demanded by some Armenians and the Great Powers in the name of reform aimed first at local autonomy and then at independence. Reforms therefore contributed to the acceleration of the nationalist movement and the formation of proindependence political parties such as the *Social Democrat Hunchakian Party* (1887), the *Armenian Revolutionary Federation-Dashnak* (1890), and *Armenakan* (1885).

Armenian discontent was apparent. The history of Ottoman Armenians from the final decade of the nineteenth century up to the start of the First World War (1914) was the history of uprisings and rebellions against the state, followed in some cases by strong government response, including the Kumkapı Demonstrations (July 15, 1890), the First Sasun Uprising (August 13, 1894), the Van Rebellion (June 15, 1895), the Zeytun Rebellion (September 16, 1895), the Ottoman Bank Incursion (August 16, 1896), the Second Sasun Uprising (1903), and the Yıldız assassination attempt against Sultan Abdülhamid II (July 21, 1905). All of these contributed to a buildup of tension between the Armenians and the Ottoman state.

The Young Turk revolution restored constitutional and parliamentary government to the Ottoman state. Young Turk leaders believed that Armenian demands should be met in a system of representative government in which Armenians could participate in power sharing and thus become loyal citizens. However, while the Young Turks wanted a united Ottoman empire, many Armenians still sought a unified greater Armenia consisting of Ottoman, Russian, and

Persian Armenians. During the Balkan Wars (1912–1913) extensive disorders involving Armenians took place in many parts of Anatolia. When the First World War started in 1914 some Armenians fought in the Ottoman army, but others saw the war as an opportunity to push for independence. Ottoman leaders, for their part, were deeply concerned about Armenian collaboration with the Russians. The stage was set for the tragic events that followed, as the government ordered much of the Armenian population to relocate from their homes to the desert regions of Syria.

■ Introduction: East Asia

In April 1895 in the Japanese coastal city of Shimonoseki, Chinese and Japanese statesmen signed the Treaty of Shimonoseki after China conceded defeat to Japan in a nine-month war, the Sino-Japanese War of 1894–1895. China had suffered 35,000 dead or wounded, twice as many as Japan, and its powerful Beiyang Fleet, made up of warships purchased from Germany and Great Britain, had been annihilated. According to the treaty, Korea, which had been a source of tension and conflict between China and Japan for more than a decade, was nominally recognized as a sovereign state but in fact became a Japanese protectorate. China also ceded to Japan Taiwan, the Liaodong Peninsula, and the Penghu Islands, a chain of small islands off Taiwan's west coast. In addition, China had to open four more treaty ports to external trade and pay an indemnity of 200 million taels (approximately eight tons of silver), a sum that was raised to 230 million taels after Japan agreed to relinquish control of the Liaodong Peninsula under pressure from Russia, Great Britain, and Germany.

The Sino-Japanese War was only one of four major wars China lost in the nineteenth century, and the Treaty of Shimonoseki was only one of a dozen treaties in which China gave away rights and territories to other powers. But this defeat and this treaty were especially galling. Even

after earlier defeats at the hands of Europeans, the Chinese still could take comfort in their centuries-old status as the dominant power in East Asia. Now this too was lost. They had lost influence in Korea and had been defeated by Japan, which had lived in the shadow of mighty China for centuries and had been dismissed by generations of Chinese as “a tiny dwarf state.”

In the wake of the Sino-Japanese War, China's fortunes continued to plummet. With its weaknesses fully revealed, the Western powers scrambled to advance loans to the cash-strapped Qing government in return for economic concessions and naval bases on Chinese territory. After they suppressed the antforeign Boxer Rebellion in 1901, seven Western powers and Japan forced China to accept the Boxer Protocol, which required China to pay reparations of 450 million taels of silver, with interest, over a 39-year period. Meanwhile, Japan went on to affirm its status as Asia's leading power after defeating Russia in the Russo-Japanese War of 1905.

Explanations for Japan's and China's starkly different experiences in the nineteenth century include long-standing cultural and political differences, dissimilar views of the outside world, and disparities in the extent and gravity of the problems they faced. In the short run, however, the roots of Japan's victory over China in

1894–1895 can be traced back to the years between the early 1850s and early 1870s, when the two nations responded to mounting foreign pressures and growing domestic problems. In Japan the catalyst was the arrival in 1853 of American warships under the command of Commodore Matthew Perry, who demanded that Japan end its seclusion policy by opening two ports to foreign trade. In 1854 the shogun's government acceded to Perry's demands and embarked on a policy of strengthening the nation's defenses until Japan was powerful enough to deal with the Western powers on equal terms. Support for this policy and the Tokugawa regime crumbled after the government was forced to make further concessions to the Western powers in the late 1850s and early 1860s. Activists known as *shishi* ("men of high purpose") launched assassination campaigns against foreigners and Tokugawa officials, disgruntled samurai and others called for reinstating the powers of the previously ceremonial emperor, and leaders of various domains ignored the shogun's authority and launched attacks on foreign ships. By 1866 the Chōshū domain, at the far western tip of Honshū and a hotbed of support for the emperor, was in full rebellion against the shogun, and when joined by Satsuma, another powerful domain in southern Kyūshū, and a number of smaller domains, this coalition defeated the shogun's army in October 1867 and formally seized power in January 1868. Although shogunal forces fought back (with the Tokugawa navy surrendering only in May 1869), a new era, called the Meiji era after the reign name ("enlightened rule") adopted by the newly restored emperor, had begun. Ruling in the emperor's name, Japan's new leaders broke with the nation's feudal past and set Japan on a path of reform that not only transformed the nation's army and navy but also introduced sweeping educational, social, cultural, and economic changes.

In China the crisis was deeper, but the response was more conservative and deliberate. Military defeats at the hands of Great Britain and France in the First and Second Opium Wars (1839–1842 and 1856–1860) had forced China to open its ports and borders to Western merchants and missionaries. The defeats also forced the Chinese to recognize the superiority of Western weaponry. In addition, midcentury

China was convulsed by three major rebellions, one of which, the Taiping Rebellion, lasted from 1850 to 1864, cost 20 million to 30 million lives, and nearly brought about the demise of the Qing dynasty.

In contrast to the bold plans of Japan's Meiji leaders, the Chinese response was cautious and ultimately inadequate. Prodded by a small core of scholar-officials, China embarked on a program of self-strengthening, which called for the introduction of Western science, weaponry, and technology but otherwise affirmed longstanding traditions of imperial rule, Confucianism, the role of scholar-officials, and the primacy of agriculture over commerce and industry. Self-strengthening resulted in the founding of arsenals to manufacture European weapons, the translation of European scientific books into Chinese, modest industrialization, and the start of a navy. But even this conservative approach to reform was opposed by hard-line Confucianists and received only tepid support from the imperial court. Even after the brief Sino-French War of 1884–1885 resulted in the destruction of China's Fujian fleet and revealed the inadequacies of its system of independent regional armies, reform lacked urgency. Army and navy officers routinely embezzled funds to line their pockets or curry favor at court, and the Dowager Empress Cixi, the *de facto* ruler of China in the late 1880s, famously diverted funds allocated to the navy to building projects at the Imperial Summer Place outside Beijing. Only after defeat by Japan in 1895 and the suppression of the Boxer Rebellion in 1901 did scholar-officials and even Cixi (who had scuttled a reform movement championed by her son the Guangzū emperor in 1898) concede that reform had to go beyond self-strengthening. In the first years of the twentieth century, as educated Chinese debated the nation's future in books and newspapers, provincial officials and the imperial court sought to create a new China along Japanese and Western lines. Increasing numbers of Chinese were convinced that such a transformation never would be achieved until the Qing dynasty was overthrown and imperial rule ended. They achieved their goal in 1911, but the result was four decades of turmoil, not the national renewal they had yearned for.

—James H. Overfield

The Nian Rebellion

The Nian (Nien) Rebellion was one of four major rebellions that wracked the Qing empire during the 1850s and 1860s. The rebellion had deep roots in the Huaibei region (the area north of the Huai River) in the provinces of Anhui, Henan, Jiangsu, and Shandong. It lasted from 1851 to 1868 and was led by a motley crew of salt smugglers, local strongmen, bandits, and disaffected peasants. The rebellion began as a localized rebellion that had no ideological or religious inspiration. Poverty and social inequities drove many to rebellion, while a disdain toward the Manchu ruling class also contributed. The rebellion was eventually suppressed by the Qing government but not before it had seriously threatened the region around the imperial capital, Beijing.

“Nian” was a term used to refer to any number of groups that arose in the Huaibei region. The earliest references go back to 1791 and were connected to illegal activities, referring to either the band that formed these groups, the torches they carried when they robbed their victims, or a type of turban they wore to disguise themselves. Before the 1850s, various groups in this region were struggling to survive through a number of illegal activities: salt smuggling, raids, robberies, kidnapping, and other clandestine activities. These groups had no central organization. They were bands of men, often connected through clan affiliation, who supplemented family incomes through illegal activities. In the 1850s these groups provided the Nian with many of their members. However, not all of these groups became Nian, and some of those who did would later stop being Nian when it was opportune to do so.

The Nian grew quickly after 1851, a year when a series of ecological disasters began that included droughts, floods, plagues, famines, and earthquakes. The worst disaster occurred in 1855 when, after several years of flooding, the Yellow River broke its bank and shifted course several hundred miles to the north. The land of this region was not good to begin with; it was generally overworked and provided a poor return to farmers and landlords alike. Coupled with the disasters, these conditions drove many desperate farmers into the arms of the growing Nian groups.

➤ ZHANG ZONGYU'S LAST DAYS

From the end of 1867 through the spring of 1868, Zhang Zongyu led his western Nian army through Shandong Province and approached both the capital in Beijing and the important port city of Tianjin. The imperial armies successfully turned back the Nian and then went on the offensive. In battle after battle they defeated the Nian, killing many of Zhang's leaders and soldiers. On July 31 the imperial forces soundly defeated the Nian and then proceeded to hound them through the countryside. The Nian were exhausted from lack of sleep and were weak from hunger. Their army began to dissolve, with many soldiers surrendering to the government, abandoning their brothers-in-arms, or dying in the ditches. Zhang refused to surrender but was unable to escape. When he tried to swim across the Tuxie River to get back to the open plains, a hail of bullets kept him from advancing. The situation was hopeless, so on August 16, bidding farewell to his eight remaining followers, he drowned himself in the river.

—Ihor Pidhainy

In 1851 after the Taiping had established themselves as a state ruling much of southern China, the Nian groups began to declare their existence openly. The Taiping were of a very different order than the Nian: the Taiping were intent on establishing a religious state and driving the Manchu “devils” out of China. The Nian did not have any such pretensions but used this opportunity to establish themselves. In 1852 there was a general meeting of various Nian groups, and Zhang Luoxing, a salt smuggler and warlord, was recognized as their leader. Zhang led Nian armies throughout the region, capturing and looting towns and then fleeing and evading government forces sent to suppress the movement. The Nian were also cooperating with the Taiping, whom they imitated in a number of ways: the Nian organized their troops on a similar banner system and adopted the appearance of Taiping flags and uniforms. The Nian leaders also accepted titles that the Taiping granted them. However, the Nian were distinctly independent of the Taiping leaders and often frustrated the Taiping on account of a lack of coordination among themselves.

The Nian had only between 30,000 and 50,000 soldiers, but these were veterans, many of whom were cavalymen. Although Zhang was captured and executed in 1863, the rebellion continued, and he was replaced as leader by his nephew, Zhang Zongyu. It was under his command that the Nian posed the greatest threat to the Qing dynasty, as he led marauding armies that almost reached the capital. Coincidentally, after the Taiping had been defeated in 1864, a number of their leaders joined the Nian forces, bringing additional vigor to the Nian cause.

The Qing government had consistently downplayed the importance of the Nian, but when it finally recognized the Nian as a problem in the early 1850s, the government was in the midst of a terrible war with the Taiping. It was with the death in 1865 of Senggelinqin, one of the Qing's leading generals, that the government became serious about destroying the Nian. In May 1865 the court appointed Zeng Guofan, a Chinese general who had successfully recaptured Nanjing in 1865 from the Taiping, to fight the Nian. Together with Li Hongzhang, Zeng pursued a plan of trapping the remaining Nian armies in smaller and smaller areas until they could be easily slaughtered.

Zhang Zongyu, along with other generals, wielded a formidable force in battling the Qing armies. However, their greatest asset was their cavalry, which they moved freely across northern China. The Qing forces were unable to chase them down, so the Qing resorted to their plan of encirclement. Aware of the dangers of Zeng's plan to trap them, the Nian broke through the lines several times at crucial junctures. In October 1866 the Nian armies divided into an eastern and western branch so as to extend their reach, split up the government forces, and make contact with Muslim rebels in northwestern China. Unfortunately this decision proved to be a great mistake, as the two Nian branches were never able to reunite. Over the next two years, Zhang's branch moved over great swaths of territory and made a final assault that found them 4 miles (6.4 kilometers) outside of Tianjin and in striking distance of the capital. Yet the government forces were able to defeat the rebels, and Zhang drowned while attempting to cross a river in 1868.

The final defeat of the Nian was a result of a number of factors: the decimation of the Nian forces and their lack of access to supplies from their home bases; the government's successful encirclement of the Nian armies in the late 1860s; the government's use of superior weapons, purchased from Western powers; and the assistance of these same powers in patrolling the waterways.

The Qing government's successful suppression of the Nian Rebellion together with that of the other three major rebellions extended the life of the dynasty. The vigorous leadership of Li and Hong also brought into government worthy Han leaders who took over positions of authority from the Manchus. Though the Nian Rebellion was put down, its root causes were not adequately dealt with, and this region experienced further rebellions that eventually led to the end of dynastic rule in China.

Taiping Revolt

The Taiping Revolt (1851–1864), a militant quasi-Christian religious movement in China, became one of the greatest popular rebellions in human history. Led by a charismatic visionary named Hong Xiuquan (1814–1864), the Taiping organization attracted millions of poor and disaffected Chinese who waged a civil war against the ruling Manchu Qing dynasty. The uprising plagued authorities for more than a decade until the Taiping order finally collapsed, leaving an estimated

20 million dead. Its repercussions contributed to the end of both the Qing dynasty and China's traditional imperial order.

Hong Xiuquan grew up in a rural farming community near the treaty port of Guangzhou in southern China. Although he aspired to join the Qing imperial bureaucracy, he repeatedly failed the civil service examinations that tested one's knowledge of the Confucian classics. In despair and frustration, Hong lapsed into a prolonged illness during which he dreamed that he ascended into heaven. In the dream two men appeared to him, one with a golden beard and the other his son, who presented Hong with a sword and urged him to slay the demons. It was only when Hong consulted a Christian tract six years later that he decided these dreams were actually visions of God and Jesus Christ and that he himself was Jesus Christ's younger brother. Hong interpreted their message as a divine command to wage war against China's Manchu rulers and establish a new heavenly kingdom on earth.

Many Chinese, especially in the south, were already frustrated with Manchu leadership. Inept handling of natural disasters, the burgeoning opium trade, and a humiliating defeat by the British in the Opium War (1839–1842) all invited criticism of Qing authority. But in addition to preaching opposition to the Manchus, Hong advocated abstinence from opium, alcohol, promiscuity, and other vices; the destruction of pagan temples and idols in accord with his understanding of Christianity; and the abolition of private property, social classes, and foot binding. Hong's radical ideas were slow to catch on, but after relocating to remote and impoverished Guangxi Province, the movement, renamed the God Worshipers' Society, quickly grew among Hong's fellow Hakka, a Chinese minority group with whom he shared a unique dialect and culture.

In 1851 imperial forces, fearful of the movement's growing strength, attacked the God Worshipers Society but were soundly defeated. This emboldened Hong to directly challenge imperial authority by proclaiming the establishment of the Heavenly Kingdom of Great Peace (Taiping Tianguo), with Hong himself as the heavenly king. Taiping forces then began moving northward, capturing hundreds of towns and gaining converts by the tens of thousands. The Taiping

succeeded in subduing much of southern and central China, and in 1853 after a bloody struggle they occupied Nanjing, converting the city into their new heavenly capital.

In the decade that followed a number of challenges weakened the revolt. Internecine feuds developed among Taiping leaders, imperial armies modernized, and foreign powers sided with the Qing. In 1864 imperial forces infiltrated the city and exterminated its 100,000 Taiping residents. Although the organization and its ideology did not survive, effects of the revolt endured. Having shifted military power from centralized imperial leadership to regional commanders, the throne undermined its own position and paved the way for the warlord era of the twentieth century. Ethnic prejudices kindled by the Taiping later inspired nationalist revolutionaries, including another Hakka by the name of Sun Yatsen, who helped finally overthrow the Manchu dynasty in 1911.

The Self-Strengthening Movement

The first major indication that a sense of crisis was brewing within the elite in China was the so-called Self-Strengthening Movement, or Foreign Affairs Movement, of the 1870s and 1880s. The Self-Strengthening Movement was basically aimed at creating a national effort, led by the government, to introduce Western industry and communications into China. Its leader was Li Hongzhang, a former aide to the military leader Zeng Guofan. Li rose to prominence during the battles against the Taipings. In 1870 Li became governor-general of the strategically placed province in which Beijing is located. He remained in the post for 25 years and from there presided over the efforts at economic development.

The self-strengtheners generally represented the highest levels of the Chinese government, and Li himself was probably the most powerful official in the nation. At the same time, they often seemed narrowly concerned with China's foreign problems. The movement therefore cannot properly be called part of the developing opposition. Nevertheless, those involved were deeply aware that China stood at a crucial turning point in its history and by no means advocated a simple continuation of the status quo. "An exhausted situation leads to change," they were fond of quoting from the *Yijing* (the *Classic of Changes*), "and this change then leads to success." As a result, their work had a critical flavor and, in particular, showed a basic dissatisfaction with the *laissez-faire* economic arrangements of the *junxian* model, in which governmental power vested in the center and the country divided up into local units administered through bureaucrats appointed by the monarch. The *junxian* system is contrasted with *fengjian*, which is decentralized rule under a hereditary lord. The movement looked back even further to early phases in the development of the *junxian* system, when *fengjian* influences were still strong and the government had assumed a far more active role in economic life than it did later on. Thus, the most famous slogan of the movement, "Enrich the State and Strengthen the Military," is particularly associated with the Qin dynasty (b. 221 BCE), which had brought the ancient *junxian* phase to completion, and with

Wang Anshi (1021–1086), the Neo-Confucian statesman of the early Song, at the start of the later *junxian* era. Indeed, the term "self-strengthening" had first been used in its economic sense in the Song, when an official concerned with border defense used it to suggest that the government initiate economic policies aimed at resisting the nomad incursions that were then engulfing the nation.

In a similar vein, the immediate goal of the self-strengtheners was to meet the Western onslaught by encouraging the material developments that had made the West a threat to China. In addition to their foreign concerns, the self-strengtheners also hoped that economic development, by raising the living standards of the people, might also provide a way of solving China's internal problems. Another common theme of the movement was *fu min* or *li min* (to enrich the people, to improve their livelihood). It was for this reason, for example, that Xue Fucheng (a leading figure in the movement) called Western technology and the possibilities it presented for human progress "a most wonderful phenomenon in the universe."

Overall, however, the self-strengtheners were not broadly concerned with reform aside from their desire to involve the government in economic development. They had little or no interest in directly attacking the injustices of society or its rampant corruption and debilitating moral vacuity.

Indeed a final purpose of the movement was to strengthen the Qing government so as to keep down rebellion. There was, in fact, a noticeable decline in popular unrest in the 1870s and 1880s. This was to some extent simply a matter of timing. One wave of rebellion had been defeated, and another had not yet gathered force. In addition, the death and desolation of the vast midcentury revolts may have reduced population pressures and left unused resources available for exploitation. However, the fact that from the restoration onward those in power had foreign arms that gave them a tremendous edge over rebels also played an important role. The self-strengtheners, deeply committed to social order, worked to maintain the advantage.

The Self-Strengthening Movement did succeed in opening a few modern arsenals,

factories, and mines and in establishing some railway and telegraph lines. However, it made almost no dent in China's basic economic problems, let alone improving the lives of the people or resisting imperialism. The plans failed partly for sheer economic reasons: China's huge poverty-stricken population left little surplus available for investment. In addition, manpower was cheap and, at least in the short run, depended on traditional ways of doing things for employment.

Difficulties also arose in administering the program. These sprang to a considerable extent from the laissez-faire traditions of the late junxian era. There was little experience with governmental activism in the economy and often scant support for it, a situation made all the worse by the corrupt character of the late Qing bureaucracy and the general problems of society. The self-strengtheners found it hard to raise taxes for their projects, and considerable tension developed as they searched for an effective relationship to the private sector. On the one hand, businessmen complained repeatedly of excessive interference on the part of officials and, on the other, of lack of support from them. At the same time, the officials involved were often accused of embezzlement or protecting their bureaucratic bailiwick rather than fostering development. Li Hongzhang in particular earned a reputation for extensive corruption. The accusations seem to have had a basis in fact. However, they were also partly the product of those who, viewing the Self-Strengthening Movement from within the laissez-faire traditions of the time, saw an effort to "enrich the state" as only an effort to enrich government functionaries.

Although the Self-Strengthening Movement represented those in power and failed to make a direct impact on China's problems, it contributed to the general sense that the nation required fundamental change and even to the *datong* direction that elite opposition was eventually to take. Critics of the existing order built on the accomplishments of the movement in paving the way for the acceptance of public effort on behalf of economic progress. At the same time, they picked up the idea that the West could provide inspiration for such effort not only in terms of new techniques but also as examples of governments

actively committed to developing and maintaining effective and powerful societies.

The Hundred Days' Reform

The Hundred Days' Reform (*wuxu bianfa* or *bairi weixin* in Chinese) was a failed 103-day reform movement (June 11 to September 21, 1898), undertaken by the Guangxu emperor (r. 1875-1908) and his supporters, including his advisers Kang Yuwei (1858-1927), Tan Sitong (1865-1898), and Liang Qichao (1873-1929), and aimed at making sweeping social and institutional changes in China. The movement ended in a coup d'état led by Empress Dowager Cixi and powerful conservative circles in which the emperor was placed under house arrest and became a figurehead. Although some reform measures were subsequently put into effect by the court, the failure of the reform movement provided the impetus for revolutionary forces to eventually overthrow the monarchy in 1911.

Earlier Chinese military defeats by Western powers along with clear signs of mass discontent as evidenced by the incidence of lawlessness and rebellion had shown that some kind of transformation was needed to meet the new challenges. The Self-Strengthening Movement (1860s to 1890s) sought to strengthen the nation through the establishment of industry and

➤ KANG YOUWEI—FROM RADICAL TO POLITICAL OUTSIDER

Kang Youwei was born into a wealthy family of scholar-officials on March 19, 1858, in Guangdong Province. He was an accomplished Confucian scholar and a famous calligrapher who as a young man increasingly turned to issues related to political reform. In 1895 following the Sino-Japanese War, Kang led hundreds of fellow scholars in a demonstration to protest the terms of the treaty with Japan and to urge reforms that would strengthen China. Kang favored an end of traditional Chinese family structures and, as an opponent of foot binding, was regarded as an advocate for women's rights. A major figure in the Hundred Days' Reform, he fled to Japan when the movement failed. After the founding of the Republic of China in 1912, Kang advocated constitutional monarchy and was the mastermind of a failed coup d'état in 1917 intended to restore the empire. As a result, Kang's reputation changed; while he was seen as a radical in 1898, he became an anachronistic outsider in 1917.

—Monika Lehner

Determined from his youth to apply his learning to China's salvation, Kang Youwei enjoyed a brief, brilliant moment of political influence during the Hundred Days of Reform in 1898. (Library of Congress)

commerce. The movement focused on the study of Western science, military technology, and production modes but was committed to supporting China's traditional Confucian culture and government institutions.

After the galling Chinese defeat in the Sino-Japanese War of 1894–1895, however, the Guangxu emperor ordered a series of reforms to promote social and institutional changes. One of the leading reformers, Kang Youwei, submitted ideas directly to the emperor. According to Kang, the preconditions for reform were modernization of the traditional examination system, elimination of sinecures, creation of a modern system of education, and bureaucratic reform. Kang and other reformers were convinced that China needed more than self-strengthening and that all measures must be accompanied by both ideological and institutional changes.

On June 11, 1898, the Guangxu emperor issued an edict to announce reform as the national policy of the country, and by September 21 more

than 100 imperial decrees had been issued. The reforms faced strong opposition from conservatives, who considered the reforms far too radical or too threatening to their entrenched positions in government. They rallied around the empress Dowager Cixi. On September 21, 1898, the empress, with the open support from top Manchu military commanders Ronglu and Yuan Shikai, headed a coup d'état. The reform-minded young emperor was forced into seclusion, and Cixi, acting as regent, took over the administration.

The sudden end of the Hundred Days' reform was accompanied by a number of new edicts. Six of the reform's leading figures were arrested and executed on September 28, 1898: Tan Sitong, Kang Guangren (a brother of Kang Youwei), Lin Xu, Liu Guangdi, Yang Rui, and Yang Shenxiu. Two other principal leaders, Kang Youwei and Liang Qichao, found refuge in Japan. Liang was actively involved in publishing reformist periodicals, while the two of them together founded the Protect the Emperor Society.

Despite the conservatives' victory in 1898, reforms did not end. After the Boxer Uprising (1898–1901) the Confucian-based examination system was abolished, and military and educational reforms based on the Japanese model followed. Military reform included the establishment of the New Army as part of a decentralized military system based on military organization on the provincial level. These New Army units later gained importance during the 1911 revolution when the majority of them cooperated with the revolutionaries.

The 1898 failure was an important impetus for revolutionary forces both within China and the overseas Chinese community. Convinced that the changes implemented by the Qing government under Cixi were inadequate, they became increasingly convinced that only the overthrow of China's imperial regime could save the nation.

Boxer Rebellion

The Boxer Rebellion (1898–1901) was the climax of antiforeign hostility in China that had been building up for much of the nineteenth century. Internal weaknesses of the Qing dynasty hampered the government's ability to respond effectively to natural disasters and imperialistic incursions by other nations. In the summer of 1898 the Yellow River broke through dikes and

flooded about 2,000 villages. The huge indemnities being paid to Great Britain and France in the wake of the Opium Wars, in combination with the financial damage caused by major mid-century rebellions, left the Qing government without the resources to respond. A secret Chinese society formed in the coastal province of Shandong called the *Yihequan*, or Society of the Righteous Harmonious Fists, believed that China could only be saved by eliminating corrupting influences. The society, called Boxers by Europeans, attempted to drive foreigners out of China. Expeditionary forces composed of regiments from the United States, Russia, Great Britain, France, and Japan finally defeated them.

The Boxer Rebellion was triggered by anger about the behavior of German Protestant missionaries, who had taken the position that Chinese converts were under German jurisdiction and could not be held accountable in Chinese courts. It was a very unfortunate time for Europeans to place themselves and their Chinese favorites above Chinese law. Millions of peasants were struggling to survive, their homes and crops having been ruined by the floods of 1898. Small groups began pillaging the property of the missionaries and the Chinese under their protection. Once begun, the violence spread quickly.

Members of the *Yihequan*, which had evolved from earlier secret societies, mobilized to support peasant resistance. The group trained intensively in the martial arts, focusing on discipline and self-control. Regional governors were generally able to control Boxer activities, and as a result, the rebellion centered around Beijing. Although the activities of the German missionaries had been a trigger, the Boxers considered all Christian missionaries to be dangerous to traditional Chinese beliefs. Much of the rebels' frustration and hostility was directed toward missionaries, churches, and Chinese converts. The Empress Dowager Cixi at first believed that the society might be instrumental in ridding China of foreign interference and aided them with imperial troops. With that assistance, the Boxers captured the Foreign Legation quarters during the early summer of 1900.

In August an expeditionary force of 18,700 troops, including 4,800 Russian, 3,000 British, 2,500 U.S., and 800 French troops, reached

THE BOXER REBELLION AND THE OPEN DOOR POLICY

The Open Door policy of the late 1800s was spawned by a perception among American leaders that China was weakening and that the United States stood to benefit from that situation. They saw in China not so much an opportunity for empire but rather a chance to expand economically and commercially. Other nations were also pressuring China's weak government for special trade and political concessions.

In September 1899, U.S. secretary of state John Hay directed a set of notes to the major European powers with economic interests in China. These notes—which formed the basis of what would later be known as the Open Door policy—specifically requested that the Europeans keep the Chinese ports they controlled open to all nations; further, Hay asked them not to grant special privileges to traders from their own countries. The six nations he addressed gave noncommittal responses to his requests, but this did not dissuade Hay from announcing that the notion of an “Open Door” to U.S. business had been accepted. The Open Door policy, when coupled with the Monroe Doctrine, reflected the U.S. quest for “informal empire,” in

contrast to the direct acquisition favored by the other imperial powers.

The Boxer Rebellion further weakened China's governmental structure. In 1900, John Hay, fearing a total collapse in China that would allow the imperial powers to carve up the country, issued a second and more important set of Open Door notes. In them, he reaffirmed the principle of free and open trade and made a further announcement of the U.S. determination to preserve China's territorial integrity. The Open Door policy was proactive well into the 1930s, when Japanese expansionism threatened China's survival. Hay's policy helped fashion the U.S. response, which included verbal pressure but no military efforts to get the Japanese out of China.

Sun Yatsen and the Beginnings of China's Revolutionary Tradition

Sun Yatsen (pinyin: Sūn Zhongshān) (1866–1925) was one of many revolutionary leaders and thinkers who advocated the modernization of China and the overthrow of the Qing dynasty in the late nineteenth and early twentieth centuries. Born in Cuiheng in southern Guangdong Province of peasant parents, he joined his prosperous older brother Sun Mei in Hawaii in 1879. There Sun received an education at Iolani, an Anglican missionary school, and later at Oahu College. Returning to Cuiheng in 1883, he was sent to study in Hong Kong, where he converted to Christianity. In 1887 Sun enrolled at the College of Medicine for the Chinese in Hong Kong, graduating in 1892 and becoming a physician.

Unlike Sun, the great Confucian scholar Kang Youwei (1858–1927) and his student Liang Qichao (1873–1929), as well as Huang Zunxian (1848–1905), were representatives of

a “reformist” tradition, typically referred to as “monarchists” by later historians of the People’s Republic of China. The reformists, or reformers, supported the modernization of China under the auspices of a constitutional monarchy, fearing that a full-scale revolution would weaken China and lead to its dismemberment by major European powers. The defeat of China in the Sino-Japanese War of 1894–1895 especially underscored the need for the empire to adopt wholesale reforms. Kang Youwei led the 1898 Hundred Days’ Reform of the Guang Xu emperor (r. 1875–1908), but this effort was quickly overturned by the coup d’état of the empress dowager. Although Kang, Liang, and other reformers were forced to flee China, they nevertheless remained committed to the idea of a constitutional monarchy. Kang, for instance, founded the Society to Protect the Emperor (Baohuanghui) in Canada in 1899.

The failure of the 1898 reforms was one of many turning points of the revolutionary movement. Sun’s awakening came earlier, however. Following China’s humiliating defeat by France in the Sino-French War of 1884–1885, Sun was convinced that the foreign Qing dynasty (1644–1911) had to be overthrown. Subsequently, he spent much of his life traveling around the world and raising funds on behalf of fomenting revolts in China, especially from the wealthy “overseas Chinese” communities, including that of Hawaii. There in Honolulu in November 1894, he created the Revive China Society (Xingzhonghui), whose Hong Kong branch planned an aborted insurrection in Canton in 1895. Fleeing to Macao, Hong Kong, Japan, Hawaii, the continental United States, and later to England, Sun was taken captive by Chinese officials in London in 1896 but released. He subsequently published *Kidnapped in London* (1897), a work that helped to make him an international celebrity. In the same year he moved to Japan. In 1898 he met the reformist leader Kang Youwei, who had fled to Japan via Hong Kong after the crackdown on the 1898 reforms. The differences between the two separate camps, of the reformists on the one hand and the revolutionaries on the other, prevented the two leaders from collaboration.

➤ THE THREE PEOPLE’S PRINCIPLES

In his autobiography, Sun Yatsen recalled that he formulated the initial framework for his Three Principles of the People—nationalism, democracy, and socialism—in 1897. In reality, these Three People’s Principles evolved slowly over the years, from the founding of the Tongmenghui (United League) party in 1905 to their greater articulation in the early 1900s by Huang Xing, Zhang Binglin, and others in the *People’s Journal* and to Sun’s 1920s rapprochement with Soviet Russia. Nationalism focused on expelling the Qing (Manchu) dynasty (1644–1911), regarded as foreign usurpers of the throne, and restoring the rule of China to the Chinese. Democracy concentrated on the gradual transition to a republican form of government. Revolutionary writers, drawing upon a rich tradition of Chinese collectivistic thought and classical studies, also cited the works of Westerners like Montesquieu and Rousseau to justify republicanism. The third principle, socialism, was called “the people’s livelihood” after 1905. It argued that a social revolution must accompany a political one if China was to avoid some of the economic problems experienced by Western nations. In this regard, Sun and other early revolutionary leaders were most influenced by the American Henry George (1839–1897), whose “single tax” on the “unearned increment” of land speculation was seen as a method of equalizing wealth.

—Paul Tenkotte

In 1900 the secret society of the Boxers staged the Boxer Rebellion (the Yi He Tuan Movement); it was subsequently suppressed by the Eight-Power Allied Forces. Humiliated by the intervention of foreign troops in the capital of Beijing, the imperial government slowly launched a series of reforms over the next decade designed to lead to some modicum of modernization. These included the termination of the old Confucian examination system; the establishment of a modern educational system; the creation of a Westernized “New Army”; the encouragement and even subsidy of Chinese students to study abroad, especially in Japan; and the commissioning of an official delegation to study political institutions in Japan, the United

States, and Europe. The latter returned to China, and a committee of 12 scholars studied their findings, recommending a very gradual transition to a constitutional form of government. Despite the reform efforts, the revolutionary movement continued unabated.

In 1900 Sun collaborated with the southern Chinese secret society of the Triads to lead an aborted rebellion in Huizhou, with the intention of establishing a republic in southern China. Additional Chinese defeats, including Russia's continuing occupation of Manchuria in 1903, rallied Chinese students in Japan to the revolutionary cause. Among these was Huang Xing (1874–1916). Likewise, Chinese students returning from Japan to the mainland began to integrate their activities with the anti-Manchurian sentiments of China's network of secret societies. For example, Huang Xing organized the Society for China's Revival (Huaxinghui) in Changsha in 1903. The organization collaborated with the secret Society of Elder Brothers and the Restoration Society (Guangfuhui) of Shanghai (also founded by returning Chinese students) to foment an uprising in 1904. The Changsha uprising failed, and Huang fled to Japan, where he met Sun. There in 1905 the Revive China Society, the Society for China's Revival, and the Restoration Society were merged in 1905 as the Revolutionary Alliance (Tongmenghui, or the United League), which supported the Three People's Principles. With the help of Huang as vice president of the party, Sun led the new party as its president. In the period 1907–1911 Sun was associated with eight unsuccessful revolts in southern China, aimed at the establishment of a separate republic. The Revolutionary Alliance, meanwhile, experienced factionalism, exacerbated by Sun's frequent travels abroad to raise funds.

When the Chinese government nationalized the railroads in May 1909, protests led by those financially affected by the move evolved into a revolutionary fervor joined by secret societies, peasants, and students. On October 10, 1911 (the "double ten," i.e., the tenth day of the tenth month), the Wuchang Uprising began in the province of Hubei along the Yanzi River. Neither Sun, who was in the United States, nor Huang

seemed to have had any direct institutional association with the Wuchang insurrection, the opening volley of China's 1911 Revolution. The Revolution of 1911 spread throughout the empire, and in its wake swept away the Qing dynasty (the emperor abdicated in February 1912) and led to the creation of the Nanjing Provisional Government under the presidency of Sun, who had hurried back to China and was inaugurated on January 1, 1912. Quickly the situation deteriorated nationally, and the military general Yuan Shikai (1859–1916) seized power. The March 1913 assassination (presumably on orders of Yuan) of Song Jiaoren, the revolutionary leader, founder of the Guomindang party (1912) and prime minister designee, underscored the growing extent of the violence. A "Second Revolution" erupted in July 1913 but was suppressed by September. Sun, Huang, and other revolutionary leaders fled China for Japan, where in July 1914 Sun fashioned a new organization titled the Chinese Revolutionary Party. Disagreements between Sun and Huang led to the disaffection of Huang and many other revolutionaries, who refused to join the new party. Meanwhile, in China the parliament was dissolved in January 1914, ushering in decades of decentralization and civil war.

Commodore Perry and the Opening of Japan

The phrase “opening of Japan” assumes that it was once closed. Japan has often been portrayed as being isolated from the rest of the world from the early seventeenth century until Commodore Perry exercised gunboat diplomacy in the mid-nineteenth century. During this time, Japan cut relations with European nations out of fear that Christianity might challenge the authority of the Tokugawa regime, and missionary groups might pave the way for foreign invasion. However, Japan maintained relations with the Dutch, who eased Japanese suspicion by refraining from all religious discourse, and with the Koreans, Chinese, and Ryukyu Islanders. Although the Japanese successfully rejected Western attempts in the late eighteenth and early nineteenth centuries to begin official relations, they could not ignore Perry’s gunships. Nevertheless, the Japanese were able to play a weak hand well, avoiding colonization, warfare, and the importation of opium that plagued China.

As early as the 1790s Americans attempted to gain access to Japan, sometimes chartering Dutch ships to enter the port of Nagasaki and conduct trade or sailing into other ports to rescue shipwrecked sailors. In the nineteenth century the United States became a Pacific presence. Several events led to increased western migration, such as the discovery of gold in California, and the acquisition of land along the West coast from Great Britain and Mexico. Moreover, the expanding whaling industry in the Pacific and a commercial treaty signed between the United States and China in 1844 resulted in more Americans sailing through the seas near Japan.

In the mid-nineteenth century several American politicians and naval commanders, including Commodore Mathew Perry, began pressing the government to send an expedition to Japan. As early as 1851 he realized that in order to secure the journey for ships along the great circle route, the shortest distance from California to Shanghai, ships needed to pass through the waters near northern Japan. Likewise, the southern shipping lane that left from Panama for Shanghai also traveled through Japanese waters, but

to the south between the Ryukyu Kingdom and Japan. Perry wanted to secure from the Japanese the right to establish a coal depot for refueling, a source of supplies for crews, and a safe haven for ships in distress or for shipwrecked sailors. He never intended to lead the expedition he had been planning himself, but President Fillmore eventually charged Perry with leading the expedition.

Fillmore sent Perry to Japan in 1852 with broad diplomatic powers and four warships to demonstrate American naval might. Even before Perry arrived, the Japanese learned of the expedition from the Dutch, but the appearance of the “black ships” in Edo Bay on July 8, 1853 caused much panic among samurai officials. Perry issued a letter to representatives of the shogun which demanded the safety of shipwrecked whalers and the opportunity to buy coal and open trade. He reassured the Japanese that Americans would not interfere with their religion.

When Perry returned a year later in 1854, he signed the Treaty of Kanagawa, which opened up two regional ports in addition to agreeing to the demands made in Fillmore’s letter. In 1856, a small consulate opened in Shimoda, a port city close to the capital of Edo but far enough to allow the Tokugawa shogunate time to stall diplomatic interaction with Townsend Harris, the American diplomat assigned to Japan. His treaty (1858) expanded the number of ports, set an unfavorable exchange rate, and granted extraterritoriality to the United States.

Acquiescing to the United States sent shockwaves throughout the ruling elite. Many samurai and daimyo lords criticized the shogunate for not expelling the Americans from Japan and ignoring the wishes of the emperor to do so. Moreover, the Tokugawa regime established a new precedent by asking politically marginalized daimyo for their opinions on the American arrival. Perry's arrival and the controversies that arose from the treaties with the United States and other western states exacerbated problems that had already been facing the Tokugawa regime, which culminated in the regime's eventual downfall in 1868.

Political Tensions in Pre-Meiji Japan

The political system by which the Tokugawa shogunate (*bakufu*) had ruled Japan since the early seventeenth century experienced increasing stress in the latter years of the eighteenth century and the early decades of the nineteenth century from sources both inside and outside Japan. The decentralized balance of power that had kept Japan united for over two centuries as well as the policy of seclusion underwent severe challenges from both inside and outside of Japan. These challenges were impossible to overcome, and as a result the seclusion policy was abandoned in the 1850s, and the Tokugawa shogunate itself was overthrown in 1868.

The challenges came from two sources. First, the growing frustration and impoverishment of the samurai coupled with the steady growth of a market economy and the emergence of new social classes were creating great strains on the traditional social and institutional order. Second, the Tokugawa shogunate was rapidly losing its

grip on power due to its deteriorating financial position and the growing power of several larger domains (*han*) that enacted successful financial reforms in the early to mid-1800s.

The shogunate recognized the extent of its financial problems in the late 1700s and imitated a number of new policies collectively known as the Kansei Reforms to increase revenues and reduce spending. The reforms accomplished little, however, and during the economically troubled Tempō era (1830–1844) the bakufu's financial weakness led to further futile initiatives known as the Tempō Reforms. Famines in the early 1830s reduced the amount of rice being sent to the major cities, which led to revolts in and around the city of Osaka in 1837 that laid waste to the nation's commercial center. Efforts by the shogunate to centralize its authority and to expropriate *han* in the Kanto (now Tokyo) and Kansai (Osaka) regions met increased nationwide resistance by young samurai dissidents, merchants, and peasants who were now emboldened by the government's apparent weakness. The bakufu's failure to better organize its finances in contrast to the large remote (*tozama*) domains such as Satsuma and Chōshū began tilting the balance of power away from Edo.

A number of intellectual movements also fostered challenges to shogunal rule. The movement for Western learning was embraced by scholars who advocated the study of Western science and technology and who therefore wanted Japan to open its doors to the West. A rival nativist National Learning school (*kokugaku*) emphasized the glory of Japan's early Golden Age and urged a restoration of divine imperial rule. This in turn inspired a loyalist movement in support of a return to imperial rule that led many samurai in the 1850s and 1860 to become political activists devoted to the emperor and hostile to the shogunate for its weakness and its alleged usurpation of imperial power. They were inspired by their slogan, *sonno jōi* ("restore the emperor, expel the barbarian"), which called for the overthrow of the weak old shogunate and the installation of a strong new imperial government that would stand up to the West.

Many historians speculate that these stresses were pushing Japan toward radical if not revolutionary change, but there are other scholars who

believe that these dissidents were not strong enough on their own to overthrow the shogunate. These growing internal sources of stress, however, were suddenly overwhelmed by a major shock from outside Japan. Russian and British ships had made several unsuccessful attempts to open Japan as early as the late 1700s. However, it was the decision by the United States and other Western powers to use their military might in the mid-1850s to force Japan to abandon its treasured policy of seclusion and open itself to the outside world that provided the spark that led to the collapse of the Tokugawa regime.

The Tokugawa government's signing of a treaty with the United States in 1854 to open Japan to the West was a highly pragmatic decision by a regime that was well aware of the power of the West and the fact that the resistance of the Chinese in the Opium War (1839–1842) had led to disaster. But the failure of the bakufu to protect Japan from the hated foreigners clearly revealed the weakness of the regime. This raised the ire of leading Japanese who began to demand the overthrow of the shogunate and the creation of a new government more able to defend the nation.

The arrival of the American fleet led by Commodore Matthew Perry in 1853 set off a series of events that resulted in the ultimate collapse of the shogunate in 1868. Abe Masahiro, then senior councilor for the shogun, quickly realized that his government had neither the strength nor the legitimacy to take on the West unaided. His decision in 1853 to ask the advice of domainal lords (daimyo) was an attempt to gain support among Japan's governing elite, but his ploy failed to deliver clear answers. Shogunal authority was seriously undermined.

Between 1853 and 1860 the bakufu abandoned its policy of national seclusion by opening several ports to Western ships. When it signed trade treaties with the Western powers in 1858, it sought approval from the imperial court, but the emperor, backed by growing numbers of antishogunal forces at his court, refused to accommodate the shogun. Rebuffed, the shogunate infuriated imperial loyalists by ratifying the treaties without imperial approval. Angry loyalists struck back by assassinating the shogunate's leading councilor, Ii Naosuke, in 1860.

YOSHIDA SHOIN

Yoshida Shoin (1830–1859) was a low-ranking samurai from Choshu who as a teacher and radical thinker greatly influenced such future important Meiji-era leaders as Prime Minister Ito Hirobumi and Takasagi Shinsaku. An intense nationalist, Yoshida was fascinated from an early age with the power and advanced technology of the West. Even before the Perry expedition arrived at Edo in 1853, Yoshida had shown early concern for Japan's foreign threat by traveling the country to study the state of its weak coastal defenses. Yoshida was also deeply critical of the weakness of the Tokugawa shogunate in its dealings with the West.

Yoshida was in Edo when Commodore Perry's ships returned there in 1854 to enact the treaties that opened Japan to the West. Yoshida made an unsuccessful attempt to board Perry's ships in 1854 and was arrested and jailed by shogunal authorities. He soon realized that Japan must both study and emulate the West if it hoped to survive Western aggression. At the same time he felt that he and other like-minded samurai must destroy the shogunate and create a new government of national unity led by the emperor. This new government would build Japan's strength by studying the means of Western power.

Yoshida's call for the overthrow of the shogunate and the assassination of Tokugawa officials led Edo authorities to arrest and execute Yoshida in 1859. However, his ideas served as both a blueprint and an inspiration to other young samurai who led the Meiji revolution, which in turn made Japan a major power.

—Daniel Métraux

Opposition to the Edo shogunate was led by young samurai in the outlying domains of Choshu and Satsuma. These young rebels, strong supporters of the sonno joi movement, were outraged at what they regarded as the shogunate's weak surrender to the West. They believed that the only way that Japan might avoid the loss of its independence was for the creation of a new vigorous government under the rule of the emperor that could stand up against the West. A series of fiscal reforms in Satsuma and Choshu instigated in the 1840s had left these provinces

with enough resources to finance a joint military expedition to overthrow the shogunate in 1868.

Starting in 1860 the shogunate attempted to create a coalition government in which the shogun and his daimyo supporters would work together with court nobles and *tozama* daimyo, but their efforts were rebuffed by the emperor and his advisers. The shogunate offered to terminate its policy of *sankin kotai* (whereby daimyo were required to spend a great deal of money and time visiting Edo on a regular basis and keeping their families as virtual hostages of the shogun) in 1862 and even launched a punitive expedition against upstart Choshu. Unfortunately for the shogunate, all these efforts failed to enhance its power.

During the early 1860s the antishogunate forces gained in power and prestige. The two large “outside” domains of Choshu and Satsuma, along with leading figures at the imperial court, were brought together in an alliance against the bakufu by young loyalist samurai. Increasingly exasperated at the growing weakness of the shogunate in its dealing with the West, troops from Satsuma, Choshu, and their ally Tosa marched on Kyoto and seized the imperial palace on January 3, 1868. They drove shogunal forces from Kyoto and declared an end of the Tokugawa shogunate. The former shogun was branded a rebel, and his family lands were confiscated. The newly constituted imperial army then marched on Edo, quickly defeated shogunal forces there, and installed the emperor in the shogun’s palace. The Tokugawa family was allowed to return to its traditional lands, while the new government began the process that led to the Meiji Revolution and the emergence of Japan as a modern nation in the late 1800s.

The Meiji Restoration

The Meiji Restoration, narrowly defined, was a coup d’état instigated by antishogunal forces led by two domains in western Japan, Satsuma (now Kagoshima Prefecture) and Choshu (now Yamaguchi Prefecture). Their soldiers seized the Imperial Palace in Kyoto on January 3, 1868, and announced the return of political power to the emperor from the Tokugawa shogunate (1600–1868). In a larger sense the Meiji Restoration represents a political, economic, and social revolution whereby the Japanese transformed their nation from a weak isolated agricultural state into a modern centralized industrial and military power during the Meiji era (1868–1912). Japan’s new leaders replaced the traditional decentralized shogunal (*bakuban*) system with a highly centralized modern government under the symbolic rule of the emperor. The 45 years of the Meiji (“Enlightened Rule”) emperor also marked the start of the rise of Asia and the start of Asian resistance to Western domination of the region.

The Meiji Restoration theoretically returned sovereign power to the emperor, who since 1600 had been little more than a political symbol. The 16-year-old crown prince Mutsuhito, who ruled Japan from 1868 until his death in 1912, was in fact the front person for a group of officials who ran the country and inaugurated all of the reforms in his name.

The Meiji Restoration occurred at a time when the Tokugawa shogunate faced many problems, including efforts of the Western powers to end Japan’s more than two-centuries-old policy of national isolation. A growing number of rural uprisings brought on by famines and high taxation were evidence of increasing restlessness and frustration throughout the land. Reform programs initiated by the Tokugawa shogunate in the 1830s and 1840s to centralize its power and increase its revenues met little

➤ FUKUZAWA YUKICHI

Fukuzawa Yukichi (1835–1901) was a major writer, teacher, political theorist, and founder of Keio University. His ideas about Japan's political and social institutions and customs played a major role in shaping the thinking of many of Japan's leaders throughout the Meiji era. The son of a minor samurai, Fukuzawa early on recognized the power and importance of the West. He began Dutch studies as a teenager but later realized the importance of English as the key language of the West. After the opening of Japan in the early 1850s, Fukuzawa traveled to Western settlements in Japan to study Western ways. He traveled to California on a brief shogunal mission in 1860 and upon his return became an important translator for the Tokugawa government.

Fukuzawa became one of the great writers and philosophers of the Meiji period and a key advocate of the Westernization of the country. He firmly believed that the success of the West rested not only in the education of many of its citizens but also in its emphasis on the development of the

individual and the freedom that the individual had to pursue his own dreams. His multivolume *Gakumon no Susume* (An Encouragement of Learning) advocated his most important teaching of “national independence through personal independence.” Japan could only become strong through the hard work and education of its people, and this could only occur if every person, however rich or poor, was given the chance to study and to excel. Success in life could only come from personal effort, an idea that Fukuzawa stressed through his motto “heaven helps those who help themselves.”

Fukuzawa was successful in instilling a sense of purpose and personal confidence in many young people in the early Meiji period and in inspiring its leaders to modernize Japan through a sound educational system. His most lasting contribution, however, may have been his founding of Keio University in the late 1800s, then and now Japan's leading private university.

—Daniel Métraux

success in marked contrast to domainal reforms in Satsuma and Choshu, which had allowed them to increase their power at the expense of the national government.

The arrival of the American fleet of Commodore Matthew Perry in 1853 commenced a chain of events that led to the collapse of the shogunate in 1868. The central government's decision to open Japan to the West exposed its own weakness and encouraged key figures in the imperial court and young activist samurai in Choshu, Satsuma, and elsewhere to question the legitimacy of shogunal rule. These loyalist forces professed their supreme allegiance to the emperor and growing disdain for the shogunate, which they criticized for its weak response to the West and its usurpation of imperial power.

The crisis reached its peak in early 1868 when forces from Satsuma, Choshu, and Tosa (now Kochi Prefecture), having proclaimed themselves the imperial army, routed shogunal forces in Kyoto and Edo and seized control of the country. A few months later the new government and the emperor moved from Kyoto to

Edo, now renamed Tokyo, and began a reform process that led to the modernization of Japan.

The Meiji Restoration was revolutionary in that the new Meiji government fomented a so-called revolution from above that changed almost every aspect of Japanese society. The Charter Oath of April 1868 set the tone for the new government. It stressed the need to abolish all vestiges of feudalism and “evil customs of the past.” There would be social equality so that commoners as well as people from the former high classes could “pursue their own calling.” Japan's new leaders also pledged to “seek knowledge throughout the world in order to strengthen the foundations of imperial rule.”

The Meiji government soon adopted the term *fukoku kyobei* (“enrich the country, strengthen the military”) as its national slogan. The slogan expressed the determination of the government to modernize and strengthen the country through a program of rapid industrialization and the building of a formidable modern military. The overarching goal was to protect Japan's independence from foreign encroachment

at a time when the rest of Asia was rapidly falling under Western domination.

Japan's new leaders quickly removed the pillars of the bakuhan system when in 1871 they converted the daimyo (feudal lord) domain system into a centralized prefectural system, declared social equality by abolishing the samurai class, and in 1873 created a modern property tax system. The government quickly realized the importance of modern Western education and by the early 1870s decreed the building of a national educational system in which all young Japanese had to attend school. Setting a goal of universal literacy, the government divided the nation into higher school districts, each of which had its own network of middle and lower schools. A major university (now Tokyo University) became the apex of higher education. Japan's new and highly successful educational system created generations of highly literate and disciplined citizens who transformed Japan into a major power.

The Meiji government created a modern military starting in late 1872, when it announced a system of universal male conscription. Newly constructed armories and shipyards provided for the material needs for the military, while foreign advisers and Japanese who had studied abroad helped the government in the organization of its new army and navy.

The government also played a major role in Japan's rapid industrialization. The Japanese government provided the necessary capital for the construction of several modern factories but soon realized the need to involve private enterprise. The eventual result was a distinctly Japanese combination of public and private enterprise efforts that led to the eventual rise of major financial and industrial combines (*zaibatsu*) that have dominated the nation's economy ever since.

The new government quickly realized the need for the importation of foreign knowledge. The Japanese government sent a large mission led by government minister Iwakura Tomomi (1825–1883). The Iwakura mission group traveled for two years (1871–1873) throughout the United States and Europe with the purpose of renegotiating unequal treaties and gathering information to help effect the modernization of Japan.

The experience abroad and the information gathered by the mission played a key role in Japan's subsequent modernization. The government soon thereafter hired several thousand foreign teachers and technicians (*oyatoi gaikokujin*) to advise Japan in the modernization of the country. Hundreds of other young Japanese studied in the United States and Europe to gain Western knowledge. Many of these students later became major figures in the modernization of Japan.

By the end of the Meiji era, Japan had become a major industrial and military power that had defeated China in the first Sino-Japanese War (1894–1895) and Russia in the Russo-Japanese War (1904–1905). The rise of Japan as the first modern Asian power inspired nationalists throughout Asia and sparked the more recent economic and military gains of many other Asian states.

Government and Politics in Meiji Japan

The goal of the leaders who overthrew the Tokugawa shogunate in 1868 was the creation of a powerful centralized government that would realize the slogan *fukoku kyōhei* (“enrich the country—strengthen the military”). Aware that virtually every other part of Asia had fallen to the West, these leaders were determined to preserve their nation's independence by modernizing the state and building a powerful military.

The government that came to power in 1868 was essentially a coalition of revolutionary factions from the imperial court and the western domains of Satsuma, Choshu, and Tosa. They were a small group of men, many from the samurai class, who did not represent a significant cross section of society and lacked broad support. They were united by a common enemy, the Tokugawa shogunate, but once they eliminated their foe, they began to struggle among themselves over policy and for power. The highest-ranking officials in the early government

➤ SAIGO TAKAMORI, THE LAST TRUE SAMURAI?

Saigo Takamori (1828–1877) is one of the most beloved and respected figures in Japanese military history. He was the son of a low-ranking samurai in the Kyushu city of Kagoshima, then a part of the Satsuma domain. By the 1860s when Satsuma, together with Choshu, was preparing to militarily overthrow the floundering Tokugawa shogunate, Saigo had become one of the domain's leading military figures. Saigo led imperial forces in the overthrow of the shogunate in 1868 and became an important figure in the new Meiji government.

Saigo became disenchanted with the new government in 1873 when it refused his request to send a punitive expedition against Korea. He felt that such an adventure would bolster Japan's international prestige and give idle samurai something to do, but other Meiji leaders felt that the new government was still too weak for such conquest. Frustrated, Saigo resigned his government posts and returned to Kagoshima.

By the mid-1870s, when the Meiji government sought to bring about true social equality in Japan by abolishing the samurai class, thousands of disaffected samurai gathered with Saigo in Kagoshima and launched a military revolt against the new government. Saigo led a force of 40,000 samurai and supporters, but the government countered with a well-armed conscript army of 300,000 men. The fighting was fierce, but in due course the government forces prevailed, and Saigo committed suicide.

The government's victory over Saigo's forces marked the last major military challenge to the government as well as the end to the privileged samurai class. Since then Japan has evolved into being one of the world's most socially equal societies.

—Daniel Métraux

were court nobles such as Iwakura Tomomi and Sanjo Sanetomi, but the real decision making lay in the hands of middle- and lower-ranking officials, including Okubo Toshimichi, Saigo Takamori, Kido Koin, and other former officials from Satsuma, Choshu, and Tosa. Several others recruited for their knowledge of the West included Okuma Shigenobu, Eto Shimpei, and Yokoi Shonan.

While these men agreed on the need of a strong unified state, they differed over how much of the old feudal society should be removed. At the center of debate were the futures of the samurai class and domains governed by daimyo (lords). Traditionalists such as Saigo opposed any real changes in the old regime, while younger officials such as Prime Minister Ito Hirobumi and military chief Yamagata Aritomo wished to push ahead with the dismantling of the old regime, which they saw as necessary to achieve national unity and strength. They believed that keeping the old institutions of government would keep Japan weak and divided.

By the early 1870s those favoring the centralization and modernization of the government prevailed completely. By late 1871 they had

abolished the domains, terminated administrative localism and domain armies, and divided the country into prefectures. They instituted a uniform land tax across the country to improve government revenues in 1873 and formed a modern military based on universal male conscription. The creation of this new conscript army and a declaration that henceforth there would be no distinct social classes brought an end to the samurai class in the mid-1870s.

If the centralization of power was the main political goal of the imperial government in the 1870s, its key economic goal was the building of industrial and commercial power. The government developed a policy of state capitalism in which it served as the principal entrepreneur, manager, and financier of modern industry. The ultimate goal of the government was not permanent involvement in the economy but instead the growth of a private enterprise economy run by citizens selected by the government who would run their respective industries in close cooperation with the government.

There was significant opposition to government policies in the mid-1870s. Many peasants rioted when faced with heavy taxes, military

conscription, and local political reforms. More dangerous were the traditionalist samurai, horrified over their loss of privilege. There were several samurai revolts, the most deadly of which was the 1877 Satsuma rebellion in Kyushu led by Saigo Takamori. It took many months of hard fighting for imperial forces to finally defeat Saigo's large rebel force.

Other protests against the authoritarian centralized Meiji government came in the form of a popular rights movement begun in 1874 by such liberal political activists as Itagaki Taisuke, Eto Shimpei, and Goto Shojiro. They urged radical political reforms to reduce the "tyranny" of the small coterie of officials controlling the government. They demanded a formal constitution and a powerful national assembly selected by a broad electorate. After a slow start the movement for popular rights gained increased support from a number of quarters including intellectuals, journalists, and wealthier peasants.

By the late 1870s and early 1880s government officials determined that Japan should have a constitution that provided for some form of national assembly. They hoped to not only counter the rising popularity of the popular rights groups but also demonstrate to the West that Japan was a modern nation based on the rule of law. They hoped that such a constitution would bolster Japan's requests for the elimination of unequal treaties with the West. Former U.S. president Ulysses S. Grant, who acted as an informal but quite influential adviser to the Meiji government during his three-month visit to Japan in 1879, urged the government to maintain its strong authoritarian control over the country and to only gradually grant increased rights to the people. Democracy, mused Grant, must mature slowly and deliberately. Grant approved of the fact that real power in Japan was in the hands of a small group of leaders—the *genro* (oligarchs)—who worked behind the scenes as advisers to the emperor but who in fact governed in the name of their sovereign.

The government determined that even with a constitution, the fundamental state structure would be monarchical, centering on the imperial institution, and that the constitution would be presented as a gift to the people from the emperor. The Meiji Constitution, officially

promulgated in 1889, featured a national assembly (Diet) chosen by a narrow wealthy electorate as well as a House of Peers appointed by the emperor. Nevertheless, most powers were in the hands of the emperor. The preamble clearly stated that the emperor had inherited "the right of sovereignty of the State" from his imperial ancestors. The central decision-making body was a cabinet, first created in 1885, led by a prime minister appointed by the emperor.

The constitution gave the Diet the power to debate and approve the annual government budget with the proviso that if a budget was not approved, the budget from the previous year would go into effect. The rising cost of government in the 1890s and early 1900s at a time when Japan was expanding its military and fighting wars against China (1894–1895) and Russia (1904–1905) over control of Korea and parts of Manchuria gave Diet politicians a powerful political weapon.

Gradually Diet members began to organize themselves into political parties that were often allied with government officials such as Ito Hirobumi. By the start of the twentieth century the oligarchs surrendered some of their power by allowing the formation of party cabinets. By the end of the Meiji period in 1912, Japan appeared to be well on the way toward establishing a constitutional monarchy. It was also the first independent Asian state to inaugurate a constitutional government based on the rule of law with a popularly elected national assembly.

■ Introduction: The Formation of New Empires

The era of world history between 1750 and 1914 was an era of revolution, but it also was an era of imperialism. This was true in the mid-eighteenth century, when France, Great Britain, Spain, and Portugal had empires in the Americas and the Caribbean islands and these same states along with the Netherlands had territorial holdings in the Philippines, the East Indies, and parts of Africa and India. It was still true in the early twentieth century. Despite the demise of Europe's American empires, in 1914 a small handful of European states, joined in the 1890s by Japan and the United States, controlled all of Africa (except Liberia and Ethiopia), southern and Southeast Asia (except Thailand), parts of South America (the Guyanas), hundreds of Caribbean and Pacific islands, and Korea and Taiwan in eastern Asia. Thus at any point in time between 1750 and 1914, much of the world was part of an empire occupied or dominated by a foreign power.

The history of western empire building since 1500 has typically been divided between the "old" and "new" imperialism. Old imperialism refers to the period from the early 1500s to the 1700s, when European maritime powers carved out overseas empires in the Americas and the West and East Indies, along with smaller territorial holdings in coastal Africa and Asia. The number of imperialist powers was small, limited to Great Britain, France, Spain, the Netherlands, and Portugal, and their motives were straightforward. All sought commercial advantage. According to mercantilism, the prevailing economic doctrine of the day, colonies served the interests of the colonizer by providing markets for finished products; sources of raw materials; certain agricultural goods such as tobacco, sugar, and spices; and, in the case of Spain's holdings in the Americas, the windfall of gold and silver. The Catholic powers of Spain, Portugal, and France also were motivated by religion. Empires provided opportunities to spread Christianity to pagans and other nonbelievers. Most historians find the motto "Gold, Glory, and God" sufficient for explaining Europe's early imperialist thrust.

No simple formula has emerged to explain the phenomenon of the "New Imperialism," which refers to the intense period of empire building, mainly by European powers, that occurred between the mid-1870s and 1914 and was directed toward Africa, Asia, and the Pacific rather than the Americas.

Viewing this outburst of empire building as a sharp departure from the presumed indifference to overseas empires in the preceding half century, historians have tended to seek the origins of the New Imperialism in specific changes occurring at the time in Europe itself. Diplomatic interpretations see the new imperialism as growing out of the intensive new rivalries among the Great Powers after the unification of Italy and especially Germany, which inevitably spilled over into competition for territorial holdings in Africa and Asia. Economic explanations also have been popular. Although differing in purpose and detail, both J. A. Hobson's *Imperialism* (1902) and Lenin's *Imperialism, the Highest Stage of Capitalism* (1916) argued that imperialism was a response to crisis in industrial capitalism. In their view, only by finding and guaranteeing access to new markets, new sources of raw materials, and new areas for investment outside of Europe could industrial and commercial growth be maintained and the capitalist system be saved from collapse. In his widely read *The Tools of Empire* (1981) and his recently published *Power over Peoples: Technology, Environments, and Western Imperialism, 1400 to the Present* (2009), Daniel Headrick has emphasized the means rather than the motives for imperialism. His studies of imperialism emphasize the key role of Europe's technological superiority in empire building.

Much recent debate about the causes of imperialism has centered on the work of two British historians, John Gallagher and Ronald Robinson, who proposed a new interpretive framework in their widely cited article "The Imperialism of Free Trade" in 1953 and their book *Africa and the Victorians: The Official Mind of Imperialism* (1961). They argued, first of all, against the idea that after decades of indifference and even

hostility to empire building, imperialism suddenly burst upon the scene with new vigor in the 1870s and 1880s. They point out that Great Britain consistently employed its power to break into new trading markets in Southeast Asia, the East Indies, parts of Africa, and above all India from 1815 onward. They also argue that the drive for colonies in the late nineteenth century was precipitated not by new circumstances or developments in Europe but rather by events in the “periphery,” that is, Africa and Asia. British policy, centered on promoting and enforcing free trade in world markets, remained constant throughout the 1800s. What sparked the scramble for formal colonies were events in Asia and Africa, where “local crises” forced Britain to intervene and establish formal political control.

Gallagher and Robinson’s theories continue to have an important place in the historiography of imperialism, although most historians now argue that the continuity they saw in imperial policy over the course of the nineteenth century may apply to Britain but not to other major powers. Imperialism did change in the 1870s, and there was such a thing as “New Imperialism.” New players entered the race for colonies, new areas such as Africa and the Pacific islands became objects of expansion, and new arguments were advanced to justify overseas expansion. Against a backdrop of an economic slowdown and rising tariffs, in the 1870s and 1880s economic arguments that promised a secure source of raw materials and food, markets for exports, and a steady level of profit and investment opportunities made sense to many people. In an atmosphere of growing nationalism, the idea that having colonies was a sign of national strength and virility also had strong appeal. Arguments based on considerations of national security—for example, that colonies on remote Pacific islands were needed as naval coaling stations or that British control of Egypt was necessary to protect their control of the Suez Canal—also were convincing. So too were the claims of missionary organizations and humanitarians that colonization would result in conversions to Christianity and the moral improvement of “backward” peoples. Every supporter of imperialism could draw upon the views of increasing numbers of historians, scientists, and social scientists whose studies “proved”

that whites were superior to dark-skinned races and hence were justified in governing them. All these factors combined still would not have resulted in the great imperialist land grab if it had not been for the technological chasm that by the late 1800s had opened up between the West and the rest of the world. Without steamships, railroads, breech-loading rifles, machine guns, international telegraph networks, and new techniques for battling tropical diseases such as yellow fever, there would have been no age of imperialism. On this, at least, historians can agree.

—James H. Overfield

Eighteenth-Century Chinese Imperialism in Mongolia, Nepal, Burma, and Tibet

In the eighteenth century, the Kangxi (1661–1722), Yongzheng (1723–1735), and Qianlong emperors (1736–1796) launched wars of conquest that more than doubled the size of the Manchu empire, taking possession of all the lands now within the borders of the People’s Republic of China, Mongolia, parts of Kazakhstan, and parts of Siberia. Less successful expeditions against the Ghurkas of Nepal (1790–92) and the Konaung dynasty of Burma (1765–69) aimed not at significant territorial gain but at establishing secure borders. However, borders remained porous, and Tibetans lived in Sichuan in the regular Chinese-administered area, Mongols lived in Xinjiang, Chinese lived in Burma, and Nepalese in Tibet. Such conditions of interhabitation were both a product of and a stimulus for trade.

Until quite recently historians of China had argued that the Manchus became Sinicized—more and more Chinese—during their rule. But Manchu and Mongolian sources tell a story of a multiethnic empire that rivaled the Ottoman empire and Romanov Russia. The Qing adopted Chinese methods to rule China proper while expanding upon Manchu military organization (the Banner system) to rule in Inner and Outer Mongolia. The Qing also used their patronage of Tibetan Buddhism, especially of the Yellow Hat sect of the Dalai Lama, to divide and control Mongolians and Tibetans. Such methods, however, could not lead to a conquest of the semiautonomous peoples of the Burma border

region. Despite losses in Burma, the Qianlong emperor's propaganda claimed success in ten major military campaigns during his reign.

Control of Mongols and other nomadic border peoples who had for centuries threatened agrarian China was one of the claims to Qing legitimacy as a Chinese dynasty. To accomplish this, the Qing emperor claimed the title of "Great Khan" as well as other simultaneous Inner Asian ruling titles. The Qing emperors managed the Mongols through the incorporation of local rulers (*khans*) into the Manchu Banner system and by the tea-for-horses exchange that kept a steady supply of horses for the imperial armies and agricultural products for the Mongols. In the Banner system, eight Mongol banner families were considered on par with Manchu banner families. Yet the western Zunghar Mongol empire, which controlled large parts of Xinjiang, Inner and Outer Mongolia, and parts of Qinghai, Tibet, and Kazakhstan, remained a major threat until it was finally wiped out by the Qianlong emperor in the 1760s. Under Kangxi in the 1690s the pursuit of the Zunghar leader Galdan in three major campaigns over thousands of miles went beyond strategic necessity to the level of personal vengeance.

Tibet was not a united entity, nor did it have a unified religion despite the dominance of the Yellow Hat sect of the Dalai Lama in Lhasa. The Zunghar Mongol invasion of Tibet in the Kangxi and Yongzheng reigns convinced Qing emperors to repeatedly occupy Lhasa and eastern Tibet although withdrawing troops each time. Qing emperors gradually increased control over Tibet by assigning governors who eventually outranked the Dalai Lama in relation to the imperial government. The Tibetan view, however, was that the Qing emperor was merely the secular patron of the Dalai Lama. Beginning in 1757 after the passing of the seventh Dalai Lama, regents were appointed to rule until subsequent Dalai Lamas came of age. Qing support of the Panchen Lama as a secondary ruler was a further measure to control Tibetan affairs, as was the institution of a lottery system in 1793 to choose the Dalai Lama from among commoners rather than the ruling classes.

In 1788 and 1792 Qing armies were sent to Tibet to repel the invasions of Gurkha armies from Nepal. Qianlong's propaganda said that the

THE QIANLONG EMPEROR'S REASONING FOR WAR-MAKING IN THE NORTHWEST

The Kangxi emperor had launched an unsuccessful initiative to eliminate the danger posed by the Zunghar Mongols to China's borders. His son and successor, the Yongzhen emperor, continued the effort, which was at last successful under the reign of Kangxi's grandson, the Qianlong emperor, in the 1760s. Qianlong wrote of his efforts:

"The Zunghars have caused trouble on the northwestern border for over four hundred years. My grandfather and father solidified the frontier against Galdan and Galdan Tseren. . . . Now these barbarian tribes have become disaffected and their minds have gone astray, offering an opportunity for revolt. How can I sit back and let them be lost? Would I not be laughed at by later generations? How could I face my grandfather and father in the afterlife? This is why we made careful plans and toiled to do the unavoidable; it was not out of a temporary love of glory, but to prevent border unrest and diligently make long-term plans."

Peter Purdue, *China Marches West* (Cambridge: Harvard University Press, 2005), 286–287.

war was to protect the timid Tibetans from the Gurkha money changers, so he subsequently installed a government mint to ensure unitary Qing currency dominance.

Yet control of Lhasa was not control of all Tibetan peoples. Two wars, in 1747–1749 and 1771–1776, were waged to suppress the Golden Stream Tibetan peoples of western Sichuan to bring them under the bureaucratic state system. These people were practitioners of the indigenous Tibetan Bon religion and the Red Hat sect of Tibetan Buddhism, a competitor to the Yellow Hat sect of which Qianlong was a patron. Despite comprising only 30,000 people, the Golden Stream people repulsed the Qing armies from their mountain fortresses. In the larger second war, Qianlong finally defeated them and incorporated these areas of Sichuan into the imperial state.

Qianlong's Burma campaigns of the 1760s sought to humble the Burmese king and clarify the double allegiance of a Shan state on the border of Yunnan and Burma yet instead demonstrated the limits of Qing military power. When King Hsinbyushin of Burma demanded tribute from the Shan state, the Qing governor-general attacked and was defeated. Second, third, and fourth attempts by successive Qing commanders were also stopped. Finally, other military commitments of the Burmese king in Laos and Siam led to an uneasy truce with the Qing. Both the Golden Stream wars and the Burmese war were largely funded by Chinese salt merchant capital.

Three interrelated issues are essential to understanding the massive expansion of the Qing empire in the eighteenth century. First, it was a Manchu empire, not a Chinese empire, that was successful in pacifying the northern steppes, and it was successful to the degree that it could create legitimacy in a multiethnic realm. Second, the Qing differentiated between protectorates incorporated into the empire such as Mongolia and Tibet and tributary states such as Nepal and Burma that sent tribute missions to Beijing to allow merchants to trade across the borders. Third, Chinese merchant activity across Qing borders was as important as Manchu diplomacy in expanding the power of the Qing state.

The Causes of Europe's New Imperialism

"New imperialism" is a term used to describe the sudden mania for expansion and conquest that gripped Western powers in the late nineteenth century. Although Western expansionism dates back to the Middle Ages, during the

final two decades of the century, the European powers and, to a lesser degree, the United States demonstrated an unprecedented enthusiasm for expansion. The rapidity of their conquests and their focus on the tropical regions of Asia and Africa—which had previously remained outside of the imperial orbit of Europe—encouraged scholars to identify the trend as new imperialism.

As late as the 1870s, most Western governments opposed the idea of conquering and administering new territories. In the 1860s the Parliament of Great Britain, the world's premier imperial power, went so far as to debate a plan to abandon the nation's tiny colonies on the west African coast. The doctrine of free trade appeared to promise British manufacturers and merchants everything they needed from the non-Western world, without the expense of conquest and administration. In the colonies with large white settler populations, such as South Africa, Canada, and Australia, the British government was moving toward encouraging greater autonomy and independence.

Such sentiments had limits, however, and European powers did not consider abandoning possessions that they considered crucial to national interests. French Algeria, British India, and the Dutch Indies were tropical colonies viewed as economically valuable to the metropole and whose non-European populations could not be trusted with self-government.

Attitudes toward imperialism changed rapidly in the 1870s due to a convergence of trends in Europe and in the non-Western world. One key development was the changing balance of power in Europe. The creation of the new nations of Italy and Germany in the 1860s and 1870s challenged the traditional supremacy of Great Britain and France in Africa and Asia. As new powers, Germany and Italy saw imperial expansion as a way to legitimize their status within Europe. France, whose defeat in the Franco-Prussian War (1870–1871) had opened the door to German unification, looked to foreign conquest as a way to offset the nation's humiliation. The desire to gain status through imperial ventures inspired Italy to conquer the economically marginal regions of Libya and Somalia, while France became master of the arid Sahara region. The imperial fervor of those new powers caused concern among

British politicians and businessmen, who feared that such conquests would jeopardize global free trade. Such fears deepened after an industrial depression arose in 1873. In the context of high unemployment and slow economic growth, workers and manufacturers in Britain and elsewhere pressured governments to secure new markets for industrial products and new sources of raw materials for domestic consumption.

In France as in other Western nations, such issues had important political ramifications in an era of growing democratization. Imperial competition became a favorite subject of a nationalistic popular press, and the rise or fall of a political administration could be tied to the success or failure of imperial ventures. Imperial lobbying groups pressured politicians to undertake new colonial ventures.

Moreover, new imperialism proved more palatable to Western governments in the 1870s because the dangers and expenses of tropical empire had dropped dramatically since the 1860s. By midcentury, European medicine had developed prophylaxis for malaria, the most severe impediment to white rule in tropical Africa, and thus allowed explorers, soldiers, missionaries, and merchants to survive on the continent. The Second Industrial Revolution of the 1860s and 1870s also had developed a set of “tools of empire” that made imperial conquest less hazardous. Whereas British troops had campaigned in India in the 1840s using weapons and artillery that were at times inferior to those of their opponents, by the 1880s steamships, exploding artillery shells, machine guns, and the telegraph gave European forces an overwhelming advantage over Asian and African armies.

Foremost among the proponents of new imperialism were missionaries, who expected colonialism to provide them with a safe forum for spreading their message. Christian missionaries had been active in Asia and Africa since the sixteenth century, but their work was limited by the regions’ often hostile rulers. Evangelical Protestant and Catholic groups expected that Western rule in Africa and Asia would aid their efforts to win converts, and many missionaries worked closely with soldiers and administrators to prepare the conquest of new regions. It is also worth noting that many missionaries

championed the independence of African and Asian states and worked to stave off imperial encroachment. Overall, however, missionary organizations played an important role in pressuring European governments to conquer new territories, and many facilitated the expansion and administration of those areas.

Intellectually, new imperialism was accompanied by a weakening of Western faith in the universal equality of humanity. That idea had developed during the Enlightenment of the eighteenth century and had played an important role in the abolition of the transatlantic slave trade. The assault on that notion began with the writings of the British naturalist Charles Darwin. Though Darwin himself repudiated the racism of many of his followers, his ideas of human evolution and natural selection appealed to supporters of imperialism. Many social Darwinists were paternalists like the British writer Rudyard Kipling, whose poem “The White Man’s Burden” viewed colonialism as the responsibility of all “white” nations. Others saw imperial expansion as a part of a ruthless struggle between races. In such a view, European peoples had to either conquer or submit to the non-Western peoples of the world. By the era of new imperialism, versions of social Darwinism and related pseudoscience ideologically justified the conquest of African and Asian peoples.

New imperialism also had its roots in the non-Western world, where political and economic changes placed pressure on European strategic and commercial interests. In Egypt, a revolt against European influence in the internal affairs of the state seemed to threaten European investment in the Suez Canal and led to a British invasion in 1881. In western Africa, competition between African and European merchants on the Niger River inspired the British Royal Navy to intervene in the name of free trade. In many regions of tropical Africa and Asia, instability threatened to disrupt Europe’s access to markets. Some African and Asian leaders also looked to Europeans as powerful outsiders who could shore up their authority or protect them from hostile neighbors. New imperialism therefore should be seen as a process inspired in part by the pull of the non-Western world.

Despite the rising enthusiasm for imperialism expressed in many Western nations, there

were also significant forces working against imperial expansion. Some clergymen regarded it as immoral, while businessmen and taxpayers deplored the costs of empire and were skeptical of its potential profitability. Thus, the early stages of new imperialism were dominated by chartered companies. Those privately owned entities attracted investors by receiving official state support for their activities. They created private armies, made treaties with local rulers, and carved out independent territories in Africa, Asia, and the Pacific. The British South Africa Company, the Royal Niger Company, the German East Africa Company, and the British North Borneo Company are examples of organizations that undertook the conquest and administration of tropical colonies with official support but at no cost to taxpayers. The most notorious of those private ventures was King Leopold II's Belgian Congo, funded by his private fortune. With no oversight from other European powers or the Belgian Parliament, Leopold used ruthless tactics to exploit a vast private estate in central Africa.

The use of chartered companies reflects the ambivalence of European governments toward imperial expansion as late as the 1890s. However, the era of such companies was short-lived, as the costs of empire swamped the resources of the investors. Wars of conquest in southern Africa overwhelmed the British South Africa Company, while the moderate profits of the east African trade threatened to bankrupt the German East Africa Company. In those and similar cases, European governments were forced to step in and take over for the private companies, which brought vast tropical regions under official imperial control.

In conclusion, new imperialism shaped the political geography of the modern world and hastened the diffusion of Western culture and technology around the globe. However, after virtually all of Africa and much of Asia had been conquered by 1900, some Europeans began to lose interest in their empires. While the activities of explorers and soldiers in the empire had seemed of national consequence in the 1890s, by 1903 imperial issues attracted little public attention. The new colonies were given autocratic administrations and were integrated into the economies of the metropole. As the wave of

imperial enthusiasm passed, the new colonies received little investment or attention from Europe.

France in Algeria

Algeria, a former province of the Ottoman empire, was invaded by France in 1830 and became France's most important overseas territory by the late nineteenth century. Situated in the Maghreb (northwestern coast of Africa), also known as the Barbary Coast in nineteenth-century accounts, Ottoman Algeria encompassed the northern coast, not the more arid desert regions to the south. It was ruled by a governor, or *dey*, who reigned quasi independently from the capital in Algiers. The population totaled 3 million and included Arabs, Berbers, Jews, and Turks. The economy was based on agricultural products such as grain and olives but was supplemented by state-sanctioned piracy in which the Barbary states preyed on European and American ships in the Mediterranean. The abduction and enslavement of American sailors prompted the United States to fight the inconclusive First Barbary War against Morocco and Tripoli (1801–1805) and then the Second Barbary War (1812–1815), which resulted in the defeat of Algeria, Tunisia, and Tripoli and put an end to U.S. tribute payments. In 1816 an Anglo-Dutch squadron forced the Algerian dey to stop enslaving Christians.

France's own involvement in Algeria began when two Algerian Jews accused the French

government of reneging on a debt. The dispute seemed trivial, but the dey hit the French ambassador with a flyswatter as they quarreled over the case. French king Charles X (r. 1824–1830) ordered a blockade of Algiers to avenge the insult (1827) and then sent the French army to take Algiers (1830). Charles had hoped that the quick victory would boost his sagging popularity, but he was overthrown in July 1830 and replaced by the more liberal Louis-Philippe (r. 1830–1848).

Louis-Philippe had opposed the invasion of Algeria, which had been accompanied by rape and the desecration of mosques, but he also feared that withdrawing troops would damage national prestige and would allow England to take over Algeria. Louis-Philippe officially annexed the conquered territories in 1834. France had conquered all major Algerian cities by 1837.

From 1832 to 1847 France faced a determined rebellion in western Algeria led by Abd al-Qadir (1807–1883), a pious Muslim from a prominent family, who controlled over half of Algeria by the late 1830s. France sent in 100,000 men led by General Thomas Bugeaud de la Piconnerie, who deliberately destroyed villages and orchards to deny Qadir supplies. Qadir surrendered in 1847, though rebellions broke out sporadically in Berber areas, most notably in 1871.

European settlers, called colons or *pieds noirs*, arrived from France, Italy, Spain, Malta, and Alsace-Lorraine after the latter was invaded by Germany in 1870–1871. By buying or taking Muslim tribal lands, the most successful settlers created large agricultural estates producing wine, cotton, grain, and tobacco for the European markets. Others made a modest living as farmers and bureaucrats. Muslims were deprived of many of their lands and generally formed a destitute majority. Land disputes frequently sparked clashes between the land-hungry colons and the military Arab Bureaus defending Muslim peasants' claims.

Algeria was first ruled by a military regime (*régime du sabre*), though an 1845 royal ordinance created *communes de plein exercice*, towns where there were enough European migrants to elect self-governing councils. In 1848 the regions of Algiers, Oran, and Constantine were reorganized into three *départements* (regions) under civilian control. Military

government returned under Napoléon III (1852–1870) before the Crémieux decrees allowed Algerians to elect deputies to the National Assembly (1870). Full citizenship rights, however, were limited to Europeans, Jews, and the few Algerians (called *évolués*) who had obtained French citizenship in exchange for renouncing certain provisions of Islamic law. Only in 1947 were Muslims allowed to vote for a local assembly, and even then they collectively had no more votes than the European minority.

Berlin Conference

The Berlin Conference (also known as the Berlin West Africa Conference) was a meeting among representatives of 12 European states as well as the United States and the Ottoman empire held in Berlin from November 15, 1884, to February 26, 1885, for the purpose of preventing conflict between European colonial powers over African territory. The meeting was more a symptom than a cause of the rising “new imperialism” of the late nineteenth century, in which the quest for commercial markets and strategic territory was veiled by the rhetoric of humanitarian ventures such as combating slavery or an alleged “civilizing mission.” The immediate causes of the conference are best understood in the context of European economic and political rivalries.

Due to a growing European interest in opening up central Africa to trade, an earlier international conference was held in Brussels in 1876. It established the International African Association under the leadership of Belgian king Leopold II with supposed humanitarian and scientific interest in Africa. Both Belgium and France organized covert missions to the Congo under Henry

➤ KARL PETERS

Karl Peters (1856–1918) was a German explorer who was instrumental in founding German East Africa (modern Tanzania) and bringing Germany into the Scramble for Africa. While working in London in the early 1880s, Peters was impressed with the methods and results of British imperialism. Upon his return to Berlin in 1884, he founded the Society for German Colonization and proceeded to eastern Africa to conclude treaties with local rulers. He returned to Germany near the conclusion of the Berlin Conference and presented his treaties to Bismarck as a *fait accompli*. Bismarck initially refused to recognize Peters's actions and declined to extend official protection to this territory. However, Bismarck changed his mind when Peters threatened to offer the concessions to Belgian king Leopold, who was interested in expanding the territory of his Congo Free State. With Bismarck's reluctant support, German East Africa was formed, and Peters returned to Africa to expand his claim.

—William Mengel

Stanley and Pierre de Brazza, respectively, to lay claim to key locations on the Congo River and present the other conference members with a *fait accompli* of acquired territory. Portugal, which had previously made claims to the Congo region, responded to the Belgian and French actions by negotiating a treaty with Great Britain in 1884. The Anglo-Portuguese Treaty supported earlier Portuguese claims at the mouth of the Congo River and created a joint commission to control river traffic. It was immediately opposed not only by France and Belgium but also by the Netherlands and the United States, which made arguments in favor of free trade in the region. The critical moment came when German chancellor Otto von Bismarck refused to support the treaty but offered to host an international conference at Berlin to resolve the dispute.

The Berlin Conference focused on five main political issues: free trade in the Congo basin, freedom of navigation on the Congo and Niger rivers, the status of Leopold's International Association, the territorial boundaries of the Congo "Free State," and the definition of "effective occupation" for the purposes of claiming African

territory. Of these, the last was the most significant, as it set the rules for the subsequent "Scramble for Africa" during the last decades of the nineteenth century. The recognition of Leopold's International Association as a sovereign state, subsequently defined as the Congo Free State, laid the foundation for creation of a harsh regime based on slave labor and rubber extraction. The humanitarian issues that were supposedly the basis for the conference were almost completely absent from the negotiations.

The Berlin Conference did not divide Africa between European powers, but it opened the door for European imperialism by setting the rules for expansion with minimal conflict between European powers. The conference established procedures for making and recognizing territorial claims and set the precedent for further agreements among European states. Although the conference did not specifically cause the partition of Africa, it accelerated the acquisition of colonies, as imperial powers could now claim African territories with a reduced risk of conflict with other European powers. Some controversy remains regarding the interpretation of European intentions in the conference. While the idea of humanitarian ideals as a significant motivating factor has long been rejected, there is still some question as to whether the goal of the conference was to establish a means for the partition of Africa or to create a structure that enabled penetration of Africa without the cost of a colonial empire.

Scramble for Africa

The term Scramble for Africa defines a period from 1884 to 1914 during which European nations engaged in a race to carve up Africa and

create formal colonial empires. Only 10 percent of Africa was under European control before the scramble; by 1912 the entire continent, except Liberia and Ethiopia, had been devoured.

After the American Revolution, European powers were generally reluctant to take on new colonies, preferring to rely on free trade and informal economic control in the belief that it was more profitable, more flexible, and less likely to lead to foreign entanglements. Notable exceptions included the British expansion in India and the French conquest of Algeria, but these were not part of a grand colonial scheme. In Africa, Europeans contented themselves with a handful of longstanding fortified trading stations. Disease, punishing terrain, and potential African resistance made expansion inland difficult, dangerous, and expensive. It was also unnecessary because African middlemen willingly brought goods that European merchants wanted to coastal trading ports.

In the 1870s, however, the situation began to change. European industrialization and intensified international economic competition tarnished the allure of free trade and convinced supporters of imperialism that colonies would help guarantee access to markets and raw materials. Others believed that colonies promised domestic political stability by distracting the masses from low wages and poor working conditions. For newly unified Italy and Germany, having colonies was proof of Great Power status. Other nations sought colonies to improve their strategic position, protect investments, or to spread Christianity.

Although pro-imperialist sentiment was growing in much of Europe, it was Leopold II of Belgium who set these impulses into motion. Chafing under the restrictions imposed by his status as a constitutional monarch, Leopold opted to make a name and fortune for himself in Africa. The privately funded International African Society was ostensibly founded in 1878 to explore the Congo River basin and engage in “humanitarian” work. However, Leopold used it to hire the Welsh-American explorer Henry Morton Stanley and send him on a mission lasting from 1879 to 1884 to sign treaties with African chieftains that granted Leopold political authority and trading rights along the southern bank of the Congo River.

When news of Stanley’s activities leaked out, the French, who had possessions in nearby Gabon, sent Savorgnan de Brazza to negotiate treaties on their behalf along the northern bank of the Congo. This upset Britain, concerned that in the wake of its takeover of Egypt France was seeking revenge by trying to secure a monopoly over the Congo River trade. Consequently, in late February 1884, the British government recognized Portugal’s historic claims to the Congo delta to ensure that a friendly power would control access to the Congo basin.

Even before it had been ratified by the British parliament, the Anglo-Portuguese treaty infuriated the rest of Europe, as it settled bilaterally what was thought to be an international issue. German chancellor Otto von Bismarck seized the opportunity to steal the diplomatic limelight and to placate France by joining prime minister Jules Ferry in demanding that the matter be submitted to an international conference. The need for such a conference was further underscored by Germany’s announcements in April and July 1884 that it had established protectorates over southwest Africa, Cameroon, and Togo. As paper partitions, Germany’s claims created a dangerous precedent and raised the possibility that rival nations could claim the same piece of territory or even that one country could claim the entire continent. During the Berlin Conference of 1884–1885 participants agreed to recognize existing German and Belgian holdings, yet insisted that all future territorial claims in Africa had to be officially announced and substantiated by actual occupation.

With the ground rules set, the race for African territory was on. In the Congo, Leopold confined his expansion to the occupation of areas already claimed on paper before the conference. Similarly, in Togo, Cameroon, and southwest Africa, the Germans sought only to make good on their paper partitions by occupying the interior. The rest of Africa, however, was a different matter.

Britain, which had enjoyed informal control over the East African coastline dating back to 1840, was forced to formalize its claims in the region as a result of Germany’s announcement days after the Berlin Conference that it had established a protectorate in East Africa. Thereafter British and German officials raced to sign

additional treaties with interior peoples and establish formal occupation of their respective protectorates. This rivalry ended in 1890 with the signing of an Anglo-German Treaty.

Eager to establish credentials as a world power, Italy also sought colonies in East Africa by transforming its small protectorate in Somalia into a larger formal empire by intervening in the internal politics of Ethiopia. When Ethiopia resisted, the Italians invaded but were crushed at the Battle of Adowa in 1896. In the peace settlement, Ethiopia allowed Italy to retain Eritrea and expand its holdings in Somalia. Humiliated, the Italians redirected their attention to the Ottoman province of Libya. They got their chance in 1911 when unrest inside the Ottoman empire created a pretext for a successful invasion and the creation of an Italian colony.

The principal architect of British expansion in South Africa was Cecil Rhodes, prime minister of the Cape Colony from 1890 to 1896 and head of the De Beers diamond mining operation. Rhodes pushed relentlessly to create an unbroken band of British territory united north to south by a Cape-to-Cairo railroad. He forcibly annexed several African kingdoms and sought to topple the Boer republic in the Transvaal in an effort to secure control of additional rumored gold fields and to create a single block of British territory. His activities helped trigger the Second Boer War (1899–1902), which led to the creation of a South African federation uniting the Cape Colony and the Boer Republics under the Union Jack.

In west and central Africa, France, shut out of Egypt, resolved to expand its existing holdings to surround and contain nearby British territories. The French hoped to expand across Africa in an effort to seize the headwaters of the Nile and force Britain out of Egypt altogether. Britain initially ignored this threat to concentrate on expanding into the interior of Nigeria and the Gold Coast, but the 1896 expedition by the French explorer Jean-Baptiste Marchand forced London to reassess French goals. Marchand's plan was to drag a small steamship in pieces from the Congo to the Sudan, where he and his compatriots would reassemble it to sail down the Nile claiming everything they saw. Desperate to prevent this, Britain dispatched an army from Egypt to recapture the Sudan, which

had fallen under the control of the Mahdi and his successors, and keep the source of the Nile out of French hands. Although the French beat them to the tiny riverside village of Fashoda in 1898, the British, having arrived with an army and a railroad, forced the French to withdraw, precipitating a short-lived diplomatic crisis.

Although the colonial powers continued to negotiate periodic border adjustments to their newly acquired holdings until the outbreak of World War I, by the early 1900s, the scramble for Africa had largely given way to the tasks of governing, extracting resources and, in the colonial powers' view, uplifting subject African populations.

Japanese Imperialism in the Meiji Era

Japanese imperialism emerged from Japan's humiliating experience of having been forced, in the mid-nineteenth century, into unequal treaties with Western powers. In a series of agreements following the Treaty of Kanagawa with the United States in 1854, Japan had been required to accept restrictions on imposing tariffs and to recognize the imposition of foreign jurisdiction. In response to Western attempts to colonize or otherwise dominate Asia, the ex-samurai warriors who initiated the Meiji Restoration in 1868 sought to create a modern state with power and prestige under the slogan of *fukoku kyōhei* (rich nation, strong army). From a geographical point of view, securing independence from foreign domination required not only integrating Hokkaido and the

► DATSUA-RON—THE INTELLECTUAL BASIS OF JAPANESE IMPERIALISM

Datsua-ron (a theory of leaving Asia) served as a powerful social norm that promoted nineteenth-century Japanese imperialism. The thesis of de-Asianization was first advocated in 1885 by a famous Japanese liberal intellectual, Fukuzawa Yukichi. In contrast to *koa-ron* (a theory of Asian unity and prosperity), Fukuzawa insisted that the modern civilization of Western countries was indispensable to the independence of Japan. He wrote, “One who befriends an evil person cannot avoid being involved in his notoriety. In spirit, then, we break with our evil friends of Eastern Asia.”

—Ryoko Nakano

Ryukyu Islands but also gaining control over Korea. Saigo Takamori, one of the leaders of the Meiji Restoration, insisted on the necessity of opening a diplomatic relationship with Korea, which was resistant toward opening its borders to foreign trade. Although his *Sei-Kan ron* (Movement for a Korean Expedition) gained wide support from former samurai who faced hardship under the new regime, the planned expedition did not materialize, and disagreements with the government over the idea led to civil war in 1877.

However, the government’s constant attention to the peninsula, as well as efforts to cultivate the reform faction of Korean ministers, demonstrated Japan’s continued interest in gaining control over Korea to bolster its political and economic position. Yamagata Aritomo, the prime minister, argued in the first Imperial Diet (1890) that Korea was a strategic buffer zone to protect Japan from invasion. When Korea demanded China’s intervention to suppress the armed insurgents called *Tohngnaks*, Japan also sent troops to Korea in response to China’s expedition. This eventually triggered the Sino-Japanese War (1894–1895). From the Japanese viewpoint, this war was a legitimate effort to end Chinese influence over Korea.

Japan’s victory against China in 1895 paved the way for its entry into world politics. In the Treaty of Shimonoseki, China approved the Japanese acquisition of Taiwan and of the Pescadores.

It also agreed to recognize the independence of Korea and to pay Japan reparations. The sudden rise of Japan alarmed the Great Powers, especially the Russians, who maintained economic interests in northern China (Manchuria). When Russia, Germany, and France demanded that Japan return the Liaotung Peninsula to China, Japan succumbed to this Tripartite Intervention. Even Britain, which had agreed in 1894 to revise the Anglo-Japanese Treaty of Amity and Commerce of 1858 (known as an unequal treaty) in consideration of balancing Russia, showed no interest in coming to Japan’s aid. Nevertheless, the Japanese government, backed by the army high command and business conglomerates (*zai-batsu*), managed to obtain railway concessions from the Korean government in the late 1890s.

The Tripartite Intervention ultimately did not deter Japan’s efforts to expand its empire. Though Britain abstained in the dispute over the Liaotung Peninsula, it officially recognized Japan’s political and economic interest in Korea in 1902 with the Anglo-Japanese alliance. Shortly thereafter, in 1904, Japan engaged in war with Russia in order to prevent Russian interference into Korean affairs and thereby protect its national interest in Korea. The Peace of Portsmouth (1905), which ended the Russo-Japanese War, recognized Japan’s interest in Korea, which facilitated Japan’s annexation of Korea in 1910.

The United States as an Imperial Power

Although the United States was an imperial power in North America throughout the nineteenth century, only in the closing decade of the 1800s did it acquire overseas territories with

substantial populations. American expansionists had long sought to push beyond the borders of U.S. territory obtained by the Treaty of Guadalupe Hidalgo (1848) following the Mexican-American War, especially in the Pacific and the Caribbean. However, prior to the Civil War, U.S. military efforts were primarily focused on subduing the Native American tribes in territories over which the United States claimed sovereignty. While such efforts continued following the American Civil War, the United States also sought control of several Caribbean islands, specifically Cuba, Haiti, and the Dominican Republic. Manifest Destiny, an ideology that held that the United States was both unique and destined by God to expand its territory in North America, fueled expansionist sentiments and arguments. Some expansionists believed that it was only a matter of time before the whole of North America as well as Mexico and much of Central and South America was annexed by the United States.

William H. Seward (1801–1872), secretary of state under presidents Abraham Lincoln and Andrew Johnson and one of the chief expansionists of his day, facilitated the purchase of Alaska from Russia in 1867. Also in 1867, the United States formally annexed Midway, two tiny uninhabited islands halfway across the northern Pacific that had been discovered and claimed by the United States in 1859 as a source of guano. Still, anti-imperialists rejected efforts made by the United States to expand into the Pacific and Caribbean. Many argued that it was contrary to the nature of the United States, as a beacon of democracy, to subjugate other peoples. Others feared an influx of territories with darker-skinned peoples who could not be readily assimilated. President Ulysses S. Grant attempted on several occasions to annex the Dominican Republic and Haiti or at least obtain control of key port facilities, but these measures were all rebuffed by the Senate, as was a negotiated purchase of the Virgin Islands from Denmark in 1867.

As the nineteenth century drew to a close, the United States took an increasingly militant stand against European interests in Central and South America because the United States sought to replace European powers, especially Britain, as the dominant economic and military power in the region. The United States deployed troops

to prevent a British incursion into Nicaragua and backed the caudillo regime of Joaquín Sinforiano de Jesús Crespo in Venezuela in 1895 in its border dispute with British interests in Guyana.

In the Pacific, the United States had long sought to tap into the vast market in China as well as expand and maintain its lucrative whaling industry. To facilitate this, coaling stations and overseas ports became necessary for whalers and U.S. naval forces. To this end, the United States extended its influence over Samoa in the late 1880s and by 1889 secured from local native leaders rights to use the excellent harbor at Pago Pago, even in the face of German and British claims to portions of the island group. Despite these incidents, the United States had not meaningfully joined the ranks of the European colonial powers. This would change in the late 1890s.

A combination of factors led to American expansion at the close of the decade. The Panic of 1893 led many to believe that the United States required new protected markets abroad for surplus manufactured and agricultural goods. Protestant missionary societies also pushed for U.S. expansion in areas where they were active. Social Darwinism, which held that stronger, fitter nations were justified in exerting control over backward peoples, also fueled expansionist rhetoric. Nationalism also played a role. President Theodore Roosevelt, for example, saw U.S. expansion overseas as essential to establishing and projecting American power in the world and placing it on par with the European powers.

Following the Spanish-American War in 1898, the United States secured Puerto Rico, Guantánamo Bay in Cuba, the Pacific island of Guam, and the Philippines. These acquisitions met with staunch resistance from anti-imperialists, especially when nationalist Filipinos, led by Emilio Aguinaldo, engaged U.S. forces in a bloody and protracted insurrection. However, expansionists overcame their opposition by claiming that the United States had merely taken up the white man's burden, as Rudyard Kipling had encouraged them to do in his 1899 poem, and were civilizing, Christianizing, and educating the native Filipinos.

Additionally, the United States also annexed the independent nation of Hawaii in 1898.

American missionaries had been operating in the islands for decades and had secured large landholdings and subsequent economic and political power. American planters, led by Sanford B. Dole, himself the son of Protestant missionaries, had fomented a bloodless revolt against the Hawaiian monarchy in 1893 with the help of American naval troops and had since then been demanding U.S. annexation. President Grover Cleveland had rebuffed such demands, but President William McKinley, in the midst of the war with Spain, pressed for the annexation and received congressional approval.

In the early twentieth century, U.S. imperialism continued in the form of interventions in Latin America. President Roosevelt, for example, gained control of the Colombian territory he needed to build the Panama Canal by helping foment a revolt by a small Panamanian separatist movement and then using the navy to make sure Colombian forces could not land to prevent the rebellion. Consequently, Colombia lost the entire isthmus to a newly formed pro-American government of Panama. Roosevelt further legitimized U.S. interventions in the Caribbean by issuing the Roosevelt Corollary to the Monroe Doctrine in 1904. Concerned about potential European intervention in nations that defaulted on their debts, Roosevelt declared that the United States alone would assume the role as policeman and occupy these nations if necessary to ensure debt payments or guarantee stability. Such was the pretext of the American intervention in the Dominican Republic in 1905 and a continuing justification for their presence, along with protecting American interests and promoting stability, in Nicaragua and Cuba throughout this time period.

New Russian Territories in Central Asia

Although the boundaries of the region that we know as central Asia are not uniformly defined, most historians and geographers define it as follows: all territory to the east of the Caspian Mountains as far as the Tien Shan range and bounded by the Russia-Kazakhstan border in the north and the Afghanistan-Pakistan border in the south. From the time of Ivan the Terrible (r. 1553–1584), the Russian empire had pushed toward this vast stretch of land, and by the early 1700s a lively trade had developed between Russia and some of the Muslim city-states of central Asia. The century between 1750 and 1850 witnessed a steady expansion by Russia into the region.

The Russian push into central Asia was accomplished primarily through military conquest, although in several instances the tsar's authority was welcomed with little resistance.

From the time of Peter the Great, Russian policy was directed at bringing the nomadic Kazakhs, living between the Caspian Sea and Lake Balkhash, under the “protection” of the Russian court. A devastating series of campaigns by invading Jungars (Kalmyks) in the southern steppe followed by incursions by Chinese forces in the early eighteenth century reinforced Russian ambition to control the region. During the 1760s Catherine the Great established a line of forts across the northern part of present-day Kazakhstan, and over the following century this frontier was steadily pushed toward the south, eventually encroaching on the territory of three city-states lying along the route of the old Silk Roads: Khiva, Bukhara, and Kokand.

The steady extension of Russian authority into central Asia alarmed the British government, which saw Russia as a potential threat to its holdings in southern Asia. By 1810 the era of geopolitical intrigue known as the Great Game had opened, with central Asia as the prize. For a century both empires jockeyed for geopolitical advantage in the region, and the final result was the creation of Afghanistan as a buffer state between Russian-controlled central Asia and British colonial India. At the conclusion of the nineteenth century Russian control would extend to

the north bank of the Amu Darya, meaning that the historical development of those parts of central Asia falling under Russian jurisdiction would differ radically from the area that would eventually encompass Afghanistan, lying to the south.

When the Russian government established protectorates over several Kyrgyz tribes in the middle of the nineteenth century, the stage was set for an eventual showdown between the tsar's forces and those of the khan of Kokand. Russian generals began peeling away portions of the khanate's territory, capturing Tashkent in 1865 and taking most of the Fergana Valley in 1875. The following year the Russians simply absorbed what remained of the chaotic khanate into its new province of Turkistan, thereby placing almost all of the central Asian peoples living to the immediate west of the Tien Shan under Russian rule. Some of the indigenous groups, including those led by Kurmanjan Datkha, whom the Russians considered a Kyrgyz "queen," joined the Russians in ousting the Kokand government.

Tsarist administration brought many changes to traditional life in the region. The lifestyle of seasonal migration was weakened by the arrival of commercial agriculture and a market economy. Expansion of the transportation and urban structures disrupted the traditional nomadic system and expanded trade both with Russia and other locations in central Asia, resulting in many central Asians abandoning the herding and hunting activities of their forefathers and becoming tradesmen, merchants, or farmers. Land ownership, always a somewhat vague and indefinite concept among the nomadic Kazakhs and Kyrgyz of the central Asian steppe, became concretely defined under Russian law, undermining the ability of such peoples to follow their herds. The social fabric of traditional central Asia life was thus slowly but inevitably unraveled.

Absorption into the Russian empire not only brought social and economic changes but also altered the cultural and ethnic landscape, as thousands of settlers from other corners of the empire arrived in the northern steppe lands of Kazakhstan at the invitation of the region's new rulers. Groups of Russian settlers had established farming communities in Kazakhstan and Kyrgyzstan as early as the 1860s, and by the 1890s numerous Slavic and German farming settlements

➤ GENERAL KONSTANTIN PETROVICH VON KAUFMAN

Konstantin von Kaufman served as the first governor-general of Russian Turkestan from 1867 to 1882, during the height of Russian expansionism in central Asia. An unabashed imperialist, von Kaufman's aggressive policies of conquest initiated several decades of strategic maneuvering between the Russian and British empires in the heart of Asia. This struggle for territory and influence, known to history as the Great Game, foreshadowed the geopolitical and ideological contests of the twentieth century. Von Kaufman's greatest legacy, however, lies in the cultural imprint that his policies left on the vast lands he ruled in the tsar's name. The emergence of a native Russianized elite, the development of an industrialized economy and expanded agricultural production, and the advancement of modernization were all key components of von Kaufman's vision for Russia's central Asian colonial holdings. The character of the central Asian states today, for better or for worse, owes much to the ambitions and governance of Russia's longest-serving military governor.

dotted the "unclaimed" lands in the region. A second and larger migration of Slavs into central Asia took place in the first decade of the twentieth century. Three hundred thousand settlers arrived in the decade between 1895 and 1905, and by 1916 1.5 million immigrants had moved into the region. Not only did the new migrants turn lands that had previously been pasture into cropland, but they also helped accelerate the cultural changes that were already under way.

Not all central Asians passively accepted the dramatic changes to their way of life. Rebellions against tsarist authority periodically erupted throughout the nineteenth century. Among the Kazakhs, Kenesary Khan, a leader of the Middle

Horde, successfully fought Russian troops for nearly a decade in the late 1830s and 1840s, but by the 1860s insurrection on the steppe lands had come mostly to a halt, as the numbers of Slavic settlers swelled and the colonial administrative structure was imposed and enforced by both the tsar's bureaucrats and soldiers.

Ironically, while the influx of both Russian control and Russian homesteaders sapped the foundations of traditional culture, these new elements in central Asian life also had the effect of crystallizing ethnic identity among indigenous groups. Advances in literacy, including instruction in native languages as well as Russian, allowed a literature to appear for the first time among some peoples. The great epic poem *Manas*, a paean to a legendary *batyr*, or Kyrgyz warrior, had been passed through generations of Kyrgyz orally, but rising literacy made the story more accessible. *Manas* and other epic tales were a central element of Kyrgyz identity and served to unify the Kyrgyz when many of their traditions were threatened by the encroachment of Russian civilization. Other ethnic groups reacted in a similar fashion to the changes wrought by colonization.

In the densely settled regions of irrigated agriculture in the river valleys of the south, tensions frequently ran high between the Russian government and natives. Under such conditions of rapid social and cultural change, conflict between central Asians and the newcomers was probably unavoidable. Friction arising from religious differences was especially acute, since those central Asians who would eventually take the identity of modern Uzbeks and Tajiks were much more devout Muslims than the nomadic peoples to the north. One of the most serious uprisings was led by a Muslim leader in 1898. The Andijan Uprising began with the call to arms by a sufi in the Fergana Valley city of the same name who declared a jihad (holy war) against the Russian government and settlers. The majority of those carrying the fight to the Russians may have been ethnically Uzbek and Tajik, but it is clear that significant numbers of Kyrgyzs joined the rebellion too before it was forcefully suppressed. Local Russian officials were surprised by the level of disaffection among their central Asian subjects and in the aftermath of

the uprising instituted changes designed to placate local grievances.

The violence of 1898 would not be the last episode of open rebellion by the tsar's restive central Asian subjects. In 1916 a more serious insurrection erupted as a result of a conscription decree. Central Asians reacted ferociously in an armed rebellion that involved most of the region. The government responded with a scorched earth policy, and thousands of central Asians attempted to flee the fighting by escaping across the Tien Shan to China. Large numbers of refugees perished from exposure and starvation. Over 100,000 indigenous central Asians died as a result of the violence, raising discontent with the status quo to a fever pitch and setting the stage for a political upheaval that would sweep the imperial government from power.

—Reuel Hanks

The “Great Game”

The Great Game is the name attributed to the nineteenth- and early-twentieth-century competition for colonial territory in central Asia. Tsarist Russia and Great Britain were the primary actors in this ongoing diplomatic, political, and military rivalry. The term Great Game was first widely popularized in Rudyard Kipling's novel *Kim* (1901). British Captain Arthur Connolly, however, was believed to have coined the phrase in his *Narrative of an Overland Journey to the North of India* in 1835. It should be noted that Russian speakers did not refer to this period as the Great Game. To them, it was the “Tournament of Shadows.”

The Great Game is generally accepted to date from the early nineteenth century until the 1907 Anglo-Russian Convention (also referred to as the Convention of Mutual Cordiality or the Anglo-Russian Agreement), although some scholars date its conclusion to later in the twentieth century. The convention gave formal unity to the Triple Entente powers, consisting of France, Great Britain, and Russia, which would fight the Triple Alliance, consisting of Austria-Hungary, Germany, and Italy in World War I. The agreement also confirmed existing colonial borders. Great Britain and Russia agreed not to invade Afghanistan, Persia, or Tibet, but were allowed

certain areas of economic or political influence within those regions.

The roots of the Great Game were planted in a period of sustained mutual fear and mistrust on the part of Britain and Russia. British and Russian leaders feared that the other side would encroach on their territorial holdings and would establish dominance in the central Asian region. It was widely believed that this would escalate into a war between the two powers at some point, but this never happened. Russia and Britain, however, did engage in a considerable number of military ventures against various peoples of central Asia. The conflicts ranged from diplomatic squabbles to shows of military force to full-blown wars.

During the early 1800s, Russia became increasingly interested in solidifying its southern borders. The Russians gained allegiance from various Kazakh hordes during the late eighteenth and early nineteenth centuries. They still faced opposition from many Kazakhs, however, including Kenesary Kasimov, who led a sustained rebellion of Kazakhs against Russia from 1837 to 1846. Much of the early-nineteenth-century Russian activity in central Asia was directed toward quelling Kazakh resistance and securing southern borders for the empire. By 1847, the Russians finally succeeded in bringing the Greater, Middle, and Lesser Kazakh hordes under Russian control.

In response to its defeat in the Crimean War (1854–1856), Russia redirected its military attention away from the Ottoman empire and the Caucasus toward eastward and southward expansion in central Asia. The terms of the 1856 Treaty of Paris effectively forced Russia to relinquish its interests in Southwest Asia, spurring a new round of imperial interest in central Asia. Russian advances in central Asia were both offensive and defensive moves, as they conquered the only areas left to them and hoped to position themselves against future British encroachment.

The British government became increasingly alarmed over the southward movement of the Russian armies throughout the nineteenth century. Russian conquest of the Kazakh steppe was followed by mid-century attacks on the central Asian oasis empires of Khokand, Khiva,

and Bukhara. The Russians began a new wave of conquests in 1864 by conquering the cities of Chimkent and Aulie Ata. Khokand was defeated in 1865 and with the unexpected Russian attack and conquest of Tashkent in 1865, Russia was positioned to launch a string of attacks in the late 1860s and 1870s that struck fear in the hearts of the British. The Russians then conquered the Bukhara state in 1868 and the Khiva khanate in 1873. Both Bukhara and Khiva were granted the status of Russian protectorates in 1873.

The Turkmen of central Asia put up strong resistance to Russian conquest during a long period of fighting between 1869 and 1885. As with most of the other areas, the Russians considered controlling the Turkmen and their territory essential for resisting possible British incursions. The Russian victory over the Turkmen at the Battle of Göktepe in 1881 was crucial. The final Russian territorial acquisition in central Asia was at the oasis of Merv in 1884. The Russians considered this conquest important because of its proximity to Afghanistan.

As the Russian advances continued, British colonial officials became fearful of the security of India. Although India was not a formal British colony until 1858, when the government ended the authority of the British East India Company, Britain enjoyed strong commercial and political influence over the area throughout the nineteenth century. For their part, Russians feared British interest in areas they considered to be in their own colonial backyard—especially Afghanistan, Persia, and Tibet.

The Great Game included two major wars between the British and the leaders of Afghanistan, with disastrous results for the British. The British hoped that Afghanistan could serve as a buffer state against Russian advances toward India. In the First Anglo-Afghan War (1839–1842), the British attempted to replace the Afghan leader Dost Muhammad Khan with a leader more amenable to British control, Shuja Shah. The Second Anglo-Afghan War was fought from 1878 to 1880, again over issues of British political and diplomatic influence in Afghanistan. In both conflicts the British faced strong opposition in Afghanistan; however, after the second conflict, they were able to establish considerable control over Afghan politics by placing Abdur

Rahman Khan in power. Abdur Rahman Khan ruled Afghanistan until 1901, largely in service of British interests in the region. Perhaps his biggest test came in 1885 in Panjdeh, in northern Afghanistan. Panjdeh was an oasis area, which the Russians wished to claim. After much diplomatic wrangling, the dispute was resolved and the Russians and Afghans agreed to a border at the Amu Darya River, ceding Panjdeh to the Russian empire.

During the early 1890s, the Russians attempted to continue a southward push through the Pamir Mountains to India's frontier of Kashmir. At this point mutual fears had reached a crisis situation, but they were temporarily resolved through the work of the Pamir Boundary Commission in 1895. This agreement paved the way for the formal acknowledgment of Russian and British colonial possessions in central Asia through the 1907 Anglo-Russian Convention. The Pamir Boundary Commission of 1895 set the definitive boundaries for the Russian empire in central Asia.

The Russians faced two major setbacks in the early twentieth century, the Russo-Japanese War of 1904–1905, and the Revolution of 1905. As a result of these reversals and against the backdrop of an emerging alliance system among the major European powers, the Russians became interested in resolving their disputes with Great Britain. In 1907, both sides agreed to a cessation of the Great Game competition by agreeing to the Anglo-Russian Convention on August 31. Under the terms of this agreement, both sides settled their disputes over territories in central Asia—including Afghanistan, Persia, and Tibet—and forged a military and diplomatic alliance that they would carry into World War I.

The Beginnings of British Rule in India

From trading post to empire, the eighteenth-century expansion of British power in India was not the consequence of government policy but rather the product of the political and commercial opportunism of ambivalent imperialists. Granted a private monopoly of trade in 1600 by Elizabeth I, the East India Company arrived in India in 1608, established friendly relations with the Mughal emperor, and built trading posts at Bombay (present-day Mumbai), Madras, and Calcutta (present-day Kolkata) after 1615. They also gained the right from the Crown to acquire territory and raise an army in 1670. By 1700, the East India Company had successfully manipulated the traditional rivalries between competing Indian states—Muslim and Hindu—to emerge as the dominant military power in southern India.

Company intervention in Indian politics in the seventeenth and eighteenth centuries led directly to the unintended creation of a British Empire in India after 1748. Before 1700, the East India Company employed the customary authority of weak Mughal emperors to advance its political and trade interests and did not seek the protection of the British Crown. With the decline of the Mughal empire and the rise of regional Indian states, the growing importance of the East India trade to the British economy, and the continuing French threat on the subcontinent, the British began to intervene in Indian politics more frequently after the Peace of Aix-la-Chapelle in 1748. The ebbing power of the Mughal empire after 1700 permitted warring Indian states to exploit imperial rivalries between Britain and France to garner support for their regional political ambitions and weaken their tribal and religious enemies. The British and French East India companies built opposing military alliances with these fledgling Indian powers in pursuit of trade and military advantage. The defeat of the Franco-Bengali alliance by Robert Clive at the Battle of Plassey in 1757 resulted in the

establishment of a British protectorate in Bengal directly under the rule of the East India Company. In 1760, Sir Eyre Coote completed the defeat of the French at the decisive Battle of Wandiwash. A decade of Anglo-French conflict in India ended in 1763 with the establishment of British imperial dominance on the subcontinent of India.

For the East India Company, however, this new empire proved a costly burden, as substantial military expenditures threatened its financial stability. The Anglo-French contest for India, a growing public consciousness of the importance of the India trade, and parliamentary concern for the expanded role of the East India Company led to calls for the supervision of Indian affairs by Parliament. Lord North's Regulating Act of 1773 and the younger William Pitt's India Act of 1784 granted the British government control over the East India Company. Although the East India Company was subject to parliamentary control, the new British Empire in India remained a quasi-private enterprise until the establishment of the Raj after the Indian mutiny of 1857–1858.

■ Introduction: Colonial Rule in Africa to 1914

When German chancellor Otto von Bismarck convened the Berlin Conference in 1884 to settle a number of Africa-related disputes, the "scramble for Africa" had already begun. In the 1870s and early 1880s, King Leopold II turned the huge Congo basin into his personal domain; Germany established the colonies of Cameroon, Togoland, Southwest Africa, and East Africa; Britain established a protectorate over Egypt; France claimed Tunisia; and France and Britain both extended their territorial claims from Africa's west coast into the interior. The delegates to the Berlin Conference, representing 12 European states, the Ottoman empire, and the United States, assumed that the African land grab was just beginning and accordingly laid down ground rules for further colonization: No nation could simply claim possession of a colony without first informing other

potentially interested nations of its intent, and once having made a claim it actually had to enter into agreements with local chiefs, fly the flag, and have administrators on the ground. After Berlin, the scramble became even more intense and hectic. Most of the continent was under European control by the late 1890s, but the scramble did not end until 1912, when Morocco was divided between France and Spain. Only Liberia and Ethiopia, comprising less than 4 percent of Africa's landmass, remained independent states.

For Europeans the conquest had provided excitement and swelled national pride, but colonial rule itself brought with it sobering responsibilities and immense challenges. The amount of new territory to administer, much of it unmapped and unexplored, was enormous. French claims amounted to just over 3.75 million square miles (9.7 million square kilometers) and those

of the British to just over 2 million square miles (5.18 million square kilometers). The new colonies had no developed transportation systems, presented an endless variety of terrains and climates, and were populated by an equally endless variety of African communities. In this complex and unfamiliar environment, administrators on shoestring budgets were expected to impose law and order, stamp out slavery where it still existed, encourage economic development, and provide an environment in which missionaries could carry on their work.

Not surprisingly, this period of early colonialism was one of trial and error. Policies changed over time and varied from region to region depending on the governing philosophies of the colonial powers and the degree to which these philosophies could be applied in different circumstances and environments. Colonial administrations did share a number of things in common, however. For one, they all excluded Africans from any significant role in policy making and legislation. Once-powerful African kingdoms were fragmented, marginalized or simply ceased to exist. Native Africans had no meaningful voice in the legislative councils installed in several British colonies, and, with the exception of a tiny number of propertied Africans in the Cape Colony, were denied voting rights when Britain granted its four south African colonies the right to elect legislatures with actual decision-making powers. Blacks in Senegal's "four communes" (St. Louis, Dakar, Rufisque, and Gorée) for a time voted alongside whites and mulattoes in elections for local officials and their representative to the French Chamber of Deputies. Between 1907 and 1914, however, they were gradually denied these rights of citizenship. Africans in the rest of France's sprawling African empire lived under militarized authoritarian governments.

Although colonial administrations denied Africans political rights, they all relied on them to carry out the day-to-day business of government. The prime example of such a policy is the British system of indirect rule, whose principles were announced by the colonial administrator Frederick Lugard and applied most completely in Nigeria and Uganda. In this system, the traditional local power structure was kept intact and local chiefs were given the responsibility

of carrying out the directives of the central administration in the villages. German and French administrators relied less on chiefs to carry out their policies, but they were no less dependent than the British on Africans to serve as soldiers, clerks, policemen, porters, revenue collectors, and labor recruiters.

Africa's new colonial masters all sought ways to generate wealth from their colonies, both to create profits for European businessmen and also to increase tax revenues. In Portuguese Africa, this meant continued trafficking in slaves. Even after Portugal succumbed to British pressure and ended the slave trade, it continued to collect service fees for the many thousands of Mozambique Africans recruited every year to work in the gold mines of South Africa. In the case of the Congo Free State, actually the private kingdom of King Leopold II of Belgium, it meant turning all uncultivated land into state property, which then was viciously exploited through the use of conscripted African labor. Once revealed, the atrocities in the Congo forced the Belgian government to strip Leopold of his holdings and assume administrative responsibility for the colony in 1908. German administrators in southwestern Africa turned over confiscated native lands to German settlers and in other parts of their empire forced Africans to grow cotton and other crops that were valuable for German industry. Such policies were abandoned only after the Herero Rebellion in southwestern Africa in 1904 and the Maji Maji Rebellion in German East Africa in 1905. French and British economic policies varied from region to region. Although the British government's investment in the building of the Uganda Railroad (the "Lunatic Line," to its opponents) is a notable exception, both European powers relied on private enterprise to develop the continent's economic potential. In West Africa, this meant encouragement of native cultivators to shift to exportable crops such as cotton, peanuts, and coffee. In most of Africa, however, it meant granting European businesses concessions to establish plantations and extract minerals and then devising policies to ensure that these businesses had a steady source of cheap African labor. In the French Congo 40 such concessions were granted in the 1890s to French companies, some of which instituted

polices no less brutal than those employed by the agents of Leopold II.

By 1914 it was clear that Africa was no treasure trove whose riches would pour forth once the magic wand of colonialism was waved over the land. Many concessionary businesses failed or pulled out of Africa after failing to generate profits. Even the richly capitalized Royal South Africa Company, organized by Cecil Rhodes to exploit the gold mines and farmlands of south-central Africa in 1889, was unable to pay dividends to its shareholders until the 1920s. Colonial administrations, which rarely collected enough tax revenues to match expenditures, had little or nothing to spend on infrastructure projects or the construction of schools and medical clinics. Just as Africa's economic development was handed over to concessionary companies, the task of bringing learning, enlightenment, and modern medicine to Africa—the so-called white man's burden—was left to missionaries and the missionary societies that supported them.

Italian Empire—Building in Africa

Although it would seem that the pursuit of an overseas empire would be a low priority for the newly unified Italian state, with its lack of internal integration, serious border disputes with Austria, and a general paucity of resources, Rome still sought this objective in competition with the other major powers of the nineteenth century. Through the quest for empire, Italy sought to achieve international prestige, potential markets, and an outlet for its excess population that would still be under Rome's political control. A particular impetus for Italian expansion was the resonance of the very name Rome with empire.

While allowed by the British government to gain a foothold in what is now Somalia, Italian efforts to create a protectorate over the Ethiopian Empire failed. Despite losing to feudal levies at Dogali in 1887, Rome signed the treaty of Wichale with Emperor Menelik II in 1889. The emperor believed he had signed a treaty recognizing his sovereignty. The Italian government felt they had cleverly bound the Ethiopians with

an admission of overlordship. When Menelik came to understand the true meaning of the treaty, he repudiated the document in 1893 and went to war.

The climax of this campaign was the disastrous Battle of Adowa in 1896, though the Italians were also fought to a standstill at Amba Alagi (1895) and Macalle (1896). Essentially, the Italo-Ethiopian conflict had become a proxy fight between London and Paris over control of the Sudan, with the result that the Ethiopian military, while essentially a feudal horde, had access to modern French and Russian weapons. When added to the raw numbers and traditional warrior ferocity of Menelik's army, the result was a crushing Italian defeat. Rome was unable even to mount a retaliatory campaign to exact revenge for the worst humiliation ever visited by a traditional state on a modern Western army.

The second major effort by the Italians came in North Africa, as the Agadir Incident encouraged Rome to try to turn its area of influence in Cyrenica and Tripolitania (modern Libya) into a formal colony, mostly from fear of French aggrandizement. This move led to the Italo-Turco War (1910–1911), which, although a war between organized armies, was mostly about securing colonial possessions in compensation for other governments' gains.

Once the Turks had stepped back from their confrontation with the Italians, mostly to deal with the Balkan War, Rome found itself locked into a long-running guerrilla war with the Senussi, a culture of desert nomads with no intention of compromising their traditions for the sake of Rome's economic and political aspirations. With encouragement from Turkey and Germany, the Senussi (under their emir Idris) were able to fight the Italians to a standstill; by 1919 Rome was forced to grant the nomads autonomy.

Italy's empire-building in Africa reached a climax in October 1935, when the Italian dictator Benito Mussolini declared war on Ethiopia, after deliberately exploiting a number of minor provocations that arose in its relations with Ethiopia. They declared victory in May, 1935, thereby avenging their defeat at Adowa, four decades earlier.

The British and Indirect Rule in Africa

Through much of the British Empire a policy of indirect rule—a method of administering local government—was adopted in many colonies. Indirect rule rested on the assumption that European and African cultures were different, and the best way to govern local communities was through the political system that Africans evolved on their own. Above the local government was a central government. Each colony was administered as an autonomous unit, divided into a number of provinces. The governor headed the central administration, aided by executive and legislative councils. The executive councils included only British officers. The legislative councils contained a few Africans, but the power of each council was limited to the colony. The governor was powerful within the colony,

but he still obeyed instructions from London. A province was divided into districts, where the system of indirect rule operated.

The British administrator most famous for implementing this idea (in the Sudan and Nigeria) and developing the best manual on it was Lord Frederick Lugard (1858–1945), author of *The Dual Mandate in Tropical Africa* (1922). Early in the twentieth century, Lugard faced the task of administering the huge area of Northern Nigeria, formerly part of the extensive Sokoto caliphate, which had a highly developed political system under a sultan and emirs. The British would have required a large number of people and extensive resources to govern such a huge area. What they chose to do was to control the sultan and emirs, who would in turn control their own people. Indirect rule in Northern Nigeria became a model for other places. The system was later extended to other areas in Nigeria and other colonies such as the Gold Coast, Sierra Leone, and the Gambia.

Under indirect rule, existing institutions were modified to meet the needs of the colonial administration. Chiefs, kings, and their officials were used for local administration to carry out the policies of the colonial government. Indirect rule reduced the cost and numbers of foreign personnel by using Africans to administer themselves. However, many of the Africans involved

► LORD LUGARD'S INSTRUCTIONS TO HIS POLITICAL OFFICERS

The following passage is taken from a list of instructions drawn up by Lord Frederick Lugard for the British political officers who interacted with Nigerian chiefs. In it he describes the officer's responsibility to instruct the chiefs in the principles of ethical behavior and good government:

"In those parts of the Provinces which are under the immediate authority of a Chief of the first or second grade, the primary . . . object of the Political Officer will be to educate them in the duties of Rulers according to a civilized standard; to convince them that oppression of the people is not sound policy, or to the eventual benefit of the rulers; to bring home to their intelligence, as far as may be, the evils attendant on a system which

holds the lower classes in a state of slavery . . . to impress upon them the advantage of delegating the control of districts to subordinate chiefs, and of trusting and encouraging these subordinates, while keeping a strict supervision over them; to see that there is no favouritism in such appointments; and to inculcate the unspeakable benefit of justice, free from bribery and open to all."

—James H. Overfield

Source

Frederick Lugard, *Political Memoranda: Revision of Instructions to Political Officers on Subjects Chiefly Political and Administrative, 1913–1918*, 2nd ed. (London: Warterlow and Sons, 1919), 10.

owed their appointments to the British officers, who could also remove them. They were expected to carry out instructions, performing the unpopular duties of collecting taxes and recruiting labor for the government. To return to the example of Northern Nigeria, the British officer, a resident or district officer, supervised and advised the local emir, instructed him on how to reform and modernize local institutions, and ensured the collection of taxes. The emir was the head of the Native Administration—he appointed district heads, village heads, and tax collectors.

Indirect rule experienced a number of problems and can be criticized on several grounds. Chiefs and kings in many areas actually gained more power than before, thus creating tension between them and their people. Indirect rule proved unsuitable to areas that were previously used to powerful kings and their officials. In areas without established centralized institutions or strong kings, as among the Igbo of Nigeria or the Swahili of Tanganyika, powerful chiefs were created for them. Known as “Warrant Chiefs” among the Igbo, they were given wide powers, they carried out unpopular decisions, and they could be individuals of low social status without much respect in the community.

In the attempt to protect traditional chiefs and institutions, as in Northern Nigeria, the British gave little encouragement to the spread of Christianity and Western education. In some cases, European officers would blame African chiefs for lack of progress, wrongly accusing them of not initiating modernization. In the quest to preserve existing institutions, some officers actually prevented rapid changes, arguing that traditions needed to be preserved at all cost. Finally, where a new African educated elite emerged, indirect rule excluded them from power. The exclusion of the educated Africans from power created a lasting hostility between them and the Europeans.

French Colonial Policy in Africa, 1750–1900

Initially limited to trading posts in Senegal, the French colonial presence grew in the nineteenth century to include Algeria and then much of northern, western, and central Africa.

France first obtained trading posts on the Senegal River (1638) and in St. Louis (1659) and Gorée (1679). These were captured by Great Britain during the Seven Years' War (1756–1763) and the Revolutionary and Napoleonic Wars (1793–1815) and then were restored to France under the 1815 Treaty of Paris. The French had little presence in the interior and limited themselves to exports of gum, ivory, and slaves. The latter item grew in importance with the development of France's Caribbean colonies in the eighteenth century.

Colonial rule changed dramatically with the advent of the Second Republic (1848). Slavery was abolished permanently, and inhabitants of Gorée and St. Louis (and later Rufisque and Dakar) were allowed to vote in French parliamentary elections. Louis Faidherbe (governor 1854–1861, 1863–1865) fought Arab warlords and expanded the French presence into the interior.

In North Africa in 1798, French forces landed in Egypt to block off British access to India. Despite initial successes, the expedition was hampered by epidemics, military setbacks in the Levant, and Britain's naval victory at the Battle of the Nile (1798). The French left in 1801, and Egypt became a British protectorate (1882). France's main remaining asset was the Suez Canal, built by Ferdinand de Lesseps during 1859–1869 and owned by a majority-French company until 1956.

Algeria (nominally a province of the Ottoman empire) was one of the infamous Barbary States that preyed on Mediterranean shipping, but the French invasion of Algeria was initially motivated by more prosaic events. A financial dispute led to a diplomatic incident with the *déy* (governor) of Algiers, leading to a French blockade of the city (1827). French king Charles X, afraid of the political repercussions of the ineffective standoff, sent French troops to occupy Algiers in 1830. His successor Louis-Philippe fought the Abd El-Kader Rebellion and occupied all of Algeria (1830–1847).

Settlers (the *pieds noirs*) came from France, Italy, Malta, and Spain and acquired vast estates where they produced tobacco, wine, and grain. Military rule was phased out as the European population increased, and three *départements* (administrative units under civilian rule) were created in 1848. Jews, along with a few Muslims who had forsaken some tenets of Islam (the *évolués*), were granted full French citizenship, but most Muslims complained of losing their lands and of being denied equal rights.

France battled rival Italian, Spanish, and German ambitions to establish a protectorate over Tunisia (1881) and most of Morocco (1911). Morocco was pacified under the governorship of Louis Lyautey (1912–1916, 1917–1925).

In sub-Saharan Africa, French colonies were long limited to the coast and the Indian Ocean islands of Réunion (1664), Mauritius (1718), and Comoro (1841). The French presence grew considerably, however, when the Berlin Conference (1884–1885) granted France vast tracts of Africa.

The Afrique Occidentale Française (French West Africa, AOF) was created in 1895 and headquartered in St. Louis and then Dakar. The federation included Côte d'Ivoire (Ivory Coast), Dahomey (Benin), Guinea, Mali, Mauritania, Niger, and Upper Volta (Burkina Faso) in addition to Senegal. In central Africa, Savorgnan de Brazza (1852–1905) explored Gabon and the Congo (1874–1875) and founded Brazzaville (1880). Thanks to his efforts, the Afrique Equatoriale Française (French Equatorial Africa, AEF) was created in 1910 and headquartered in Brazzaville. It included Chad, the French Congo (Congo-Brazzaville), Gabon, and Ubangi-Shari (Central African Republic).

France established a protectorate in Djibouti (1885), conquered Madagascar (1895–1896), and gave up its ambitions in the Sudan after the Fashoda Crisis (1898). France ceded part of Cameroon to Germany in 1911 in exchange for Morocco, then regained the entire colony at the Treaty of Versailles (1919), along with Togo.

Appraisals of the French presence in Africa vary considerably. Critics view French colonial rule as an example of naked greed, marked by land appropriations, racial discrimination, theft of local resources, forced labor, and disregard for local customs. Others point to France's civilizing mission (*mission civilisatrice*), the creation of infrastructures, the eradication of slavery, health and education projects, and the work of philanthropists such as Albert Schweitzer in Gabon (1875–1965).

The Congo under Leopold II and Belgium

The territory known today as the Democratic Republic of the Congo was officially recognized as the private estate of King Leopold II of Belgium in 1885 following the Conference of Berlin, after which Leopold manipulated world powers into granting him personal control over this vast swath of central Africa. Leopold dressed his interest in this region in the guise of philanthropy, claiming that he wished to eradicate slavery and bring the blessings of European civilization such as free trade and Christianity. In reality his reign over this land, known during the time of his control as the Congo Free State, came to be

recognized as a period of unparalleled brutality and exploitation.

Leopold's real interests in the Congo lay in personal aggrandizement and enrichment. He wanted Belgium to have the prestige of being a player in the colonization of Africa, and he wanted to make huge personal profits. Both of these aims he accomplished but only by compelling the Africans in the Congo Free State to provide the resources of this rich region through forced labor of the worst kind. Leopold poured his own personal fortune into the Congo and in return eventually reaped tremendous profits from exporting rubber, which was in high demand in the late nineteenth century due to the development of the pneumatic tire for bicycles and cars.

Depraved methods were used to force Africans to tap the rubber vines that grow wild in the Congo's rain forests. Because Africans were paid little or nothing for harvesting this commodity and thus had no incentive to collect it, the white agents of the concessionary companies that were responsible for extracting rubber from the Congo and sought to maximize profits turned to increasingly repressive tactics to coerce the laborers. The agents dictated rubber quotas for individuals and villages, and if a quota went unfulfilled the agents called upon members of the concessionary company militias or the Force Publique, Leopold's army of African soldiers led by white, mainly Belgian, officers, to imprison or even destroy families and entire villages. Additional tactics included beatings, floggings administered with the deadly *chicotte* (hippopotamus-hide whip), torture, mutilation, rape, and murder. To prove that no bullets had been wasted while meting out reprisals, soldiers severed one hand from each person killed and presented the hands to company agents. Occasionally hands would even be removed from the living as part of the reign of terror. Forced population movements and ecological disruptions led to outbreaks of disease, particularly sleeping sickness, adding to the misery and mortality. Significant depopulation in the Congo was one outcome of these factors as well as of the decision of many to flee these depredations.

Eventually these horrors came to the attention of the international community, first through the writings of two black Americans:

➤ AN EYEWITNESS TO ATROCITY

Reverend John B. Murphy, an Irish member of the American Baptist Missionary Union who served in the Congo Free State, was among the first missionaries to publicly decry the horrors of forced labor. Missionary dependence on King Leopold for permission to operate in the Congo led many others to remain mute about what they had witnessed until public sentiment had already turned against Leopold. Their private writings, however, sometimes detail their earlier dismay.

"I . . . have been to the interior and have seen the ravages made by the State in pursuit of this iniquitous trade. . . . [Rubber] has reduced the people to a state of utter despair. Each town in the district is forced to bring a certain quantity to the headquarters of the commissaire every Sunday. It is collected by force. The soldiers drive the people into the bush. If they will not go they are shot down, and their left hands cut off and taken as trophies to the commissaire. . . . These hands, the hands of men, women, and children, are placed in rows before the commissaire, who counts them to see that the soldiers have not wasted the cartridges. The commissaire is paid a commission of about 1d. a pound upon all the rubber he gets. It is therefore to his interest to get as much as he can."

the journalist and historian George Washington Williams, who traveled to the Congo in 1890, and Reverend William Sheppard, who four years later brought to a shocked world's attention the severing of hands. In 1896 Reverend E. V. Sjöblom, a Swedish missionary who was a member of the American Baptist Missionary Union, wrote an exposé widely circulated in the international press, while Roger Casement, an Irishman and British consular officer who toured the Congo in 1903, reported in detail on the atrocities. Simultaneously, Edmund Dene Morel, who worked for the Liverpool-based Elder Dempster shipping company that handled Congolese imports and exports, realized that the rubber must

be the product of unfree labor, since little of value went to the Congo while rubber poured out of it. He transformed individual concerns into a worldwide campaign of condemnation, in 1904 founding Britain's Congo Reform Association and, in the United States, the American Congo Reform Association that made effective use of the press and firsthand missionary accounts to mobilize the public. Pressure grew for Belgium to end the atrocities, and in 1908 Leopold agreed to turn his private fiefdom over to the country of Belgium. Subsequently the Congo Free State became the Belgian Congo, under the control of the Belgian government until attaining independence in 1960. The worst excesses associated with King Leopold's time were reined in, though the use of forced labor for activities such as road building continued.

British Policy in South Africa

In the late nineteenth century, Britain sought to unify its colonies in southern Africa into a single self-governing dominion in order to fully integrate the region into the British Empire. However, this ambition clashed with the wishes of the Boers, Afrikaans-speaking descendants of seventeenth-century Dutch farmers who intermingled with later European settlers to the region and who controlled two Boer republics, the Transvaal and the Orange Free State. The struggle between the British and the Boers culminated in

the Boer (South African) War (1899–1902), which paved the way for the unification of South Africa.

In 1867 diamonds were discovered near the confluence of the Orange and Vaal Rivers, and in 1886 massive gold fields were discovered in the Transvaal. These two discoveries transformed the economy of southern Africa. Thousands of new migrants poured into the region to work the diamond and gold mines, while trade flourished and railways were constructed to connect the port towns with the interior. Seventy-five million pounds was invested in the Transvaal gold mines by 1899, and the Transvaal soon became the largest producer of gold in the world.

The substantial economic opportunities had a significant impact on British administration in the region. There was an increased willingness

British general Sir George Colley leads a charge at the Battle of Majuba Hill, just prior to his death. The Boers defeated British forces at this 1881 battle and regained their independence. The Battle of Majuba Hill was a major setback for the British forces in the First Boer War and the cry "Remember Majuba" was to become famous among South African soldiers fighting the British in the Boer War of 1899–1902. (Library of Congress)

to expand British territorial holdings in southern Africa, as symbolized by the annexation of Griqualand West (location of the first diamond discoveries) in 1871. The British South Africa Company, led by Cecil Rhodes and chartered in 1889, was commissioned to secure control over what would become Southern Rhodesia in the hope that significant mineral deposits would be discovered there. The scramble for Africa also spurred British expansion. The German colonization of Southwest Africa in 1884 caused the British to annex Bechuanaland, which had otherwise been deemed worthless, so that they could maintain northern access to central Africa.

A primary focus of British efforts in southern Africa during the late nineteenth century was the federation of its colonies into a single self-governing entity, similar to the Dominion of Canada. It was believed that such a dominion would cement the region within the British Empire. The major impediment to this goal was the two Boer republics, the Orange Free State and the Transvaal. The Boers valued the independence of their republics, which the British had effectively acknowledged in the early 1850s, and did not wish to place themselves any further under British rule. In 1877 when the Transvaal was faced with bankruptcy due to long wars with neighboring Africans, the British annexed the country to further the project of federation. In order to cement the alliance, the British invaded and conquered Zululand in 1879. The effect on the Boers, however, was the opposite of what the British had hoped. Early British defeats at the hands of the Zulus had convinced the Boers that the British could be defeated militarily, while the ultimate defeat of the Zulus removed a major threat to the republics, allowing them to focus on the British. The result was the Transvaal War (1880–1881) between the British and the Boers, and after the latter achieved an important victory at Majuba Hill on February 27, 1881, the British entered into negotiations with the Boers, which resulted in the convention of Pretoria (1881). Through this agreement the independence of the Transvaal was assured, although the British retained a theoretical claim of suzerainty over the Boers.

The Transvaal War ultimately did not resolve the relationship between Britain and the

➤ CECIL RHODES

One of the leading proponents of British imperialism, Cecil Rhodes (1853–1902) arrived in southern Africa in 1870 and quickly made his fortune in the Kimberley diamond mines. In 1880 he formed the De Beers Mining Company, which became the leading diamond mining and trading firm in the world. In the following year he entered politics as a member of the Parliament of the Cape Colony and became prime minister of the colony in 1890. Throughout his career he advocated the expansion of British territory. He also formed the British South African Company to annex what became Southern Rhodesia and aspired to construct a Cape-to-Cairo railway to unify British colonies in Africa. The failure of the Jameson Raid was a severe setback for Rhodes and forced his resignation as premier of the Cape Colony. Illness plagued him for much of his life, and he died in 1902. His will established the Rhodes Scholarships for study at Oxford University.

—Wesley Ferris

two Boer republics. The discovery of gold in the Transvaal in 1886 coupled with the realization in the early 1890s that no significant mineral deposits existed to the north in Southern Rhodesia only amplified the importance of the Boer republics to British hopes of a unified southern Africa. By the mid-1890s a significant number of foreigners, known as Uitlanders, had moved to the Boer republics to work the gold mines. The Boers, anxious to maintain their political dominance of the republics, denied them political rights. The cause of the Uitlanders was championed by Rhodes and other British imperialists and became central to the public case against the Boers in Britain. In 1895 an uprising by Uitlanders was planned, intended to coincide with an armed intervention of soldiers in the employ of the British South African Company. The uprising collapsed, and the raiders were quickly rounded up. The fiasco of what became known as the Jameson Raid embarrassed Rhodes and the British government but did not fundamentally alter the desire of the British for supremacy in southern Africa. For the Boers, it demonstrated that the British would stop at nothing to dominate their independent

republics. The new high commissioner for South Africa, Alfred Milner, urged an aggressive stance against the Boers to the point of war. By 1899 both sides had come to see conflict as the only way out of their confrontation.

The resulting Boer War ended in the defeat and annexation of the two Boer republics by the British, fulfilling British goals for a unified South Africa. However, the Boers, having reconciled themselves to British rule, were able to achieve primacy within the new dominion and ensure that it conformed to Boer ideals.

The Founding of the Union of South Africa

After the conclusion of the Boer War (South African War) in 1902, the British were able to finally achieve their goal of creating a self-governing dominion in southern Africa with the formation of the Union of South Africa in 1910. This new dominion was integrated into the British Empire and reflected the reconciliation between the British and the Boers, Afrikaans-speaking descendants of seventeenth-century Dutch settlers of South Africa who subsequently intermingled with other European settlers. It came, however, at the expense of the rights of the majority African population.

Since the late 1860s the British had aimed at the formation of a self-governing federation of the British colonies in southern Africa, anchored in the British Empire. With the annexation of the two Boer republics, the Orange Free State and the Transvaal, in 1902, the project of federation could be advanced. Alfred Milner, the high commissioner for South Africa, believed that for

South Africa to be fully integrated and secure in the British Empire, significant British migration would need to occur in order to overwhelm the Boer population. Efforts to achieve this failed, though, as most British migrants were attracted to the better land available in other settler colonies. Indeed, Chinese indentured laborers had to be imported beginning in 1904 to work in the gold mines, which proved politically embarrassing to the Unionist government in Britain and contributed to the Liberal election victory of 1906. Thus the Boers remained the most numerous non-African demographic, but this did not prove to be a significant impediment to federation. Most of the Boers quickly reconciled themselves to a place within the British Empire and realized that the creation of a self-governing dominion for South Africa offered the prospect of significant Boer self-determination.

A critical component of Boer domination of an independent South Africa was the franchise, and it would be on this issue that the African inhabitants of South Africa would be bitterly disappointed. They had initially welcomed the victory of the British over the Boer republics, hoping that it would result in greater political rights. However, a provision of the Treaty of Vereeniging, which had ended the Boer War, stipulated

The signing of the Treaty of Vereeniging at Melrose House in Pretoria, at the end of the Second Boer War, May 31, 1902. Boer general Christiaan de Wet signs the treaty, watched closely by the British commander Horatio Herbert Kitchener. British colonial governor Sir Alfred Milner sits to the left of Kitchener, while Boer general James Barry Munnik Hertzog (to the right of de Wet) talks to Captain Henley, secretary to Milner. ► SOUTH AFRICAN NATIVE AFFAIRS COMMISSION

In 1903, High Commissioner Alfred Milner appointed the South African Native Affairs Commission to make recommendations regarding common policies toward Africans in what would become the Union of South Africa. Presided over by Sir Godfrey Lagden, it reported in 1905. The most important of its recommendations was that territorial

segregation of whites and Africans should be a basic principle of land ownership. Similar recommendations were made for the segregation of Africans in urban areas as well as in politics. These proposals would form an important basis of the future policy of apartheid in South Africa.

—Wesley Ferris

that the question of the franchise would be deferred until self-government had been granted to the former Boer republics. Once self-government was granted, there was no possibility of the Boers extending the franchise to the Africans.

In 1908 a National Convention met to discuss the terms of union, and in 1909 it forwarded to London a proposed constitution for what would become the Union of South Africa. Despite the race-based franchise, the British government felt that it could not reject the constitution without jeopardizing the entire project of federation. The proposed constitution was approved, and in 1910 the Union of South Africa came into existence. Through the limited franchise and other racial measures, the British handed authority for South Africa over to a white minority dominated by the Boers. Thus the creation of South Africa further entrenched the racial hierarchy in that country and was another step towards the apartheid of the later twentieth century.

German Colonial Policy

The German colonial empire in Africa—comprising Togo (and the eastern part of present-day Ghana), Cameroon (and some territory in present-day eastern Nigeria), Southwest Africa

(present-day Namibia), and East Africa (present-day Tanzania, Rwanda, and Burundi)—originated in uncoordinated activities of several adventurer-entrepreneurs (merchant companies, explorers, and missionary societies) during the heyday of the so-called European scramble for Africa. The German government guaranteed the interests of these groups with letters of protection (*Schutzbrieife*) in 1884–1885, a move that marked the legal beginning of German colonial rule. The state remained, for a time, uninvolved in the actual establishment of a colonial administration and the development of an infrastructure for the economic exploitation of the newly annexed territories and instead delegated these tasks to the private enterprises that would profit most from the exploitation of colonial lands. By the late 1880s and early 1890s, however, the failure of colonial governance by chartered companies had become glaringly apparent and forced the creation of a state-run colonial administration.

Neither a formal colonial civil service nor a definitive colonial philosophy existed at this time. Indeed, institutions of education for colonial service, which sought to emulate British and French examples, were not established until the beginning of the twentieth century. In 1898 the privately run German Colonial School began instructing future colonial settlers at Witzenhausen in Hesse; a college for future colonial administrators did not come into being until 1908 with the foundation of the Colonial Institute at Hamburg. Moreover, the number of government agents dispatched remained minuscule compared to the vast territories they were supposed to rule. Even in 1914, for example, the administration of Cameroon, a colony roughly the same size as metropolitan Germany, included fewer

> BERNHARD DERNBURG

When Germany belatedly created an independent colonial ministry in 1907, the man appointed to serve as its first cabinet-level secretary seemed a surprising choice. Bernhard Dernburg (1865–1937) was neither a politician nor a career bureaucrat but instead was a banker. Moreover, in the still largely aristocratic and conservative halls of government, a half-Jewish liberal, upper-middle-class bourgeois with an educational background in economics and business administration was an anomaly. Nevertheless, he seemed the right person to reform the inefficient crisis-ridden colonial administration. Dernburg, who had made his name as a “Mr. Fix-It” for various businesses teetering on the brink of bankruptcy, initiated an era in German colonial policy shaped by an almost technocratic approach to colonial administration and development. At the heart of his reform program lay the idea that indigenous peoples ought not to be regarded as annoyances or hindrances to economic progress but rather as one of a colony’s greatest assets. As the first chief colonial officer to visit the empire himself, he also fostered a greater domestic understanding and perhaps popularity of colonial questions in Germany itself.

—Daniel Becker

(Library of Congress)

than 100 civil servants. Colonial governors and their subordinates thus often felt compelled to rely on the cooperation of indigenous political elites—some of whom the Germans created because they could not find willing collaborators among traditional leaders—for the maintenance of the colonial order.

These vagaries of colonial administration, in combination with a dearth of concrete policy directives from Berlin, resulted in a system in which spontaneous short-term measures in response to local events took precedence over any far-sighted master plan of colonial policy and development. Moreover, colonial policies differed significantly from one colony to another, often depending on the temperaments and philosophies of individual colonial administrators. In general, conditions imposed on the indigenous population were harsher and more exploitative where the colonial military or white settlers

dominated everyday governance. Where the colonial civil service succeeded in enforcing its theoretical superiority in decision making over private or military interests in practice, German policy usually proved more benign, even if it still had a significant and often destructive impact.

Not until the uprisings against German colonial rule in Southwest Africa and East Africa in 1904 and 1905 exposed the considerable problems of this laissez-faire approach did metropolitan policy makers embark on creating a more rigorous and focused set of general principles and guidelines. Under the aegis of Bernhard Dernburg, the first cabinet-rank colonial secretary appointed in 1907, and his successors, German colonialism shifted toward policies of more sustainable economic development. The construction of roads and railways was accelerated, a more consistent (though not necessarily less abusive) system of indigenous taxation

and labor service was introduced, and volumes of production and trade with the colonies increased. While these reforms were beginning to show some fruits of success within a few years, the outbreak of World War I cut any truly significant progress short. Between 1914 and 1916 most of the colonies fell into enemy hands, and Germany was forced to cede its overseas possessions to the victors of the war in the Treaty of Versailles in 1919. After this ignoble end of the colonial empire, German nationalists unleashed a concerted propaganda campaign to whitewash their country's colonial record, creating the myth of a particularly benevolent and successful German colonial policy that remains strong in contemporary popular discourse despite a growing body of historical research to the contrary.

African Resistance to Colonial Rule

Between 1750 and 1914, Africa went from complete independence to near-complete colonial domination, with the most rapid change occurring during “the scramble for Africa” of the late nineteenth century. African resistance to the imperial powers was extensive but rarely successful. Decentralized African states lacked the power and economic resources to maintain large armies and keep them in the field for extensive campaigns. Although many African armies used firearms, their weapons were inferior to those used by European troops and the native troops whom the Europeans hired and trained. As a result, by the start of World War I only Liberia and Ethiopia were still independent.

None of this was clear at the start of the nineteenth century. In 1769 Moroccan soldiers

drove the Portuguese from Mazagão (al-Jadida), a fortress occupied since 1502. Spain surrendered Oran to the dey of Algiers in 1792. Fort Amsterdam, a Dutch trading post on the Gold Coast (in present-day Ghana), surrendered to the Ashanti army without firing a shot in 1806, while a year later a British army was defeated and forced to retreat from the Egyptian city of Rosetta (al-Rashid) by troops under the command of Egypt's future ruler, Muhammad Ali. Another British defeat, at the Battle of Nsamankow (January 24, 1824) during the First Anglo-Ashanti War, is more instructive, however. Following their defeat the British recruited a large force of African auxiliaries from the Fante, Ga, Akim, and Denkyera people, all of whom were hostile to Ashanti hegemony. At Katamanso in 1826, the Ashanti faced superior numbers and superior technology. The battle's turning point came when the British unleashed a barrage of Congreve rockets. These notoriously inaccurate weapons created a ferocious series of random explosions that unnerved the already hard-pressed Ashanti and caused their rout.

Katamanso serves as a model for the challenges facing Africans resisting colonial forces. The imperialists could lose a battle, but they rarely lost a war. Europe had the resources to build more armies and larger armies, in most cases with African troops. They also equipped them with modern weapons. African forces, supported by weak economies, could not be so easily replaced, were often smaller than the force pool available to their enemies, and seldom employed state-of-the-art technology.

Despite these handicaps, resistance was fierce across the continent. The British fought five wars with the Ashanti (1826–1831, 1863–1864, 1873–1874, 1894–1896, 1900). In southern Africa, they suffered a famous disaster at Isandhlawana (January 22, 1879), where Zulu *impis* (regiments) outflanked and nearly annihilated a mixed force of British regulars and native allies. To put Isandhlawana in perspective, more British officers died there than against Napoleon at Waterloo.

French imperialists also faced stiff wars in North and West Africa. After initial success during their invasion of Algeria (1830), they struggled to defeat a skillful guerrilla campaign conducted by Abd al-Kadir (1808–1883). This took nearly 12 years, and even with Abd

al-Kadir's defeat, French military efforts to dominate North Africa were not concluded until the mid-1930s. An equally hard-fought war in western Africa featured Samori Ture (1830–1900), who as head of the Wassoulou directed a 12-year struggle against French invaders.

In the Horn of Africa, Sayyid Muhammad Abdille Hasan, referred to as the “Mad Mullah” by the British, led Somali clans in a 20-year struggle against British, Italian, and Ethiopian imperialists. During the 1880s Muhammad Ahmad, recognized by Sudanese Muslims as the *mahdi*, created a *jihadi* state that fought Egyptians, Ethiopians, Italians, Belgians, and the British. In the end, both Somali and Sudanese resistance were crushed.

It was the same in southern Africa. German imperialists faced opposition from the Maji Maji revolt that swept through East Africa during 1905–1907. The revolt was put down with great loss of African lives. Simultaneously, in a notorious campaign of total war, German troops nearly obliterated the Herero and Nama people of South-West Africa. In the Horn, as in the north, fanatical bravery was no match for modern weaponry.

Exceptions to this pattern of African defeats are southern Africa's Basotho Kingdom and Ethiopia. The Basotho, united under Moshoeshoe (1786–1870), faced Zulu, Boer, and British enemies. They embraced firearms, used mounted troops and horses, and practiced guerrilla warfare. Taking advantage of the kingdom's rugged terrain, Basotho warriors repeatedly battled invaders to a standstill. These tactics worked again when British authorities annexed Basotho lands and attempted to confiscate native-owned firearms. Basotho resistance and the resulting Gun War (1880–1881) led to a settlement in which

Basutoland became a Crown colony, but with its chiefs maintaining much of their power. Ethiopia benefited from a series of skillful leaders: Tewodros II (1818–1868), Yohannes IV (1831–1889), and Menelik II (1844–1913). Each recognized his country's pressing need not just for modern weaponry but also for additional revenues and diplomatic connections with the Great Powers. Menelik skillfully played off the disparate agendas of the United Kingdom, France, and Italy. He conducted his own imperialism, pushing southward to draw more resources into his empire, and he spent nearly all government revenues importing firearms, ammunition, and artillery. Combined with a large army and good leadership, these policies led to the resounding triumph over Italian invaders at Adwa (March 1, 1896). Unlike previous African victories, this time there was no European comeback, at least not until the 1930s, when Italy under Mussolini conquered Ethiopia. Nonetheless, Adawa became an iconic symbol for twentieth-century Africans resisting colonialism.

■ Introduction: South Asia, Southeast Asia, and Oceania in the Nineteenth Century

One word summarizes the major theme in the histories of South Asia, Southeast Asia, and thousands of Pacific islands in the nineteenth century: colonialism. Before

1750, most Pacific islands still were unknown to Europeans, and the sole European colony was Guam, used by Spain as a source of water and provisions for galleons making the so-called

Acapulco Run between Acapulco, Mexico, and the Philippines. Europeans had been trading in the Indian Ocean and the South China Sea since the early 1500s, but with the exception of the Spanish Philippines and Portuguese and later Dutch holdings in the East Indies, Europeans controlled only a few scattered coastal outposts in the region. This changed between the 1750s, when the British took control of the northeast Indian state of Bengal, and the years around 1900, when the last few Pacific islands were claimed by one of the European powers or the United States. After a century and a half of Western imperialism, throughout South and Southeast Asia and the vast region of the Pacific Ocean, only Thailand remained independent.

A new phase in the history of imperialism in these regions began in India, where in the mid-eighteenth century the worldwide military and economic competition between Great Britain and France was played out between two trading companies, the British East India Company and the French East India Company. The result was French defeat and relegation to a minor position in India, while the British took over Bengal. Over the next half century the armies of the East India Company, with support and encouragement from the British government, extended British authority over one Indian state after another, partly in pursuit of economic gain and partly to protect the conquests they already had made. With the conquest of the Punjab in 1849, India consisted of territories directly ruled by the British and hundreds of mostly small independent princely states whose rulers collaborated with British authorities. Imperialism unfolded more slowly in Southeast Asia and the Pacific. The Dutch expanded their holdings in the East Indies in the 1870s, the French completed their conquest of Vietnam in 1884, and the British established control of all of Burma at the conclusion of the Third Anglo-Burmese War in 1886. The British also turned their three trading centers on the Strait of Melaka—Singapore, Penang, and Melaka—into the Straits Settlements in 1867 and extended their authority over the princely states of the Malay Peninsula with the formation of the Federated Malay States in 1895. The Western takeover of the Pacific islands took place from the mid-1870s to the early 1900s.

As was true with imperialism in Africa, imperialism in Asia and Oceania had various motives. Colonies provided markets for manufactured goods and access to tropical regions where marketable crops such as sugarcane, coffee, tea, coconuts, cotton, rice, pineapples, and indigo could be grown; they also provided access to minerals such as Malaysian tin and Pacific island phosphates, nickel, and copper. More than economics was involved, however. The French intervened in Vietnam to protect Roman Catholic clergy and native Christians from government persecution while simultaneously boosting national pride after their devastating loss in the Franco-Prussian War of 1870–1871. In the Pacific only a few territories were formally annexed by Western powers until the 1870s, despite extensive commercial and missionary activity in the region dating back to the early 1800s. In the last three decades of the 1800s, Western powers gradually took over one island group or island after another, sometimes because the islands had some economic or strategic importance but often because of the need to intervene in local political conflicts or to prevent a rival from making a territorial gain. In the case of Hawaii, annexation by the United States occurred in 1898 after a small group of American planters and businessmen overthrew the Hawaiian queen in 1893 and established the Republic of Hawaii, whose major purpose was to encourage a U.S. takeover.

Methods of governing the new colonies in Asia and Oceania varied, but in every case (except the U.S.-ruled Philippines, which had an elected legislature) general policy was set by officials in European capitals, with no significant input from the colonized peoples. In some cases, such as Burma, precolonial rulers were deposed or marginalized, while in others, such as in the British Straits Colony and many Pacific island colonies, traditional rulers were maintained and used as instruments of indirect rule. While the British and Dutch were willing to utilize native elites to carry out policy at the village level, the French in Indochina preferred to use French nationals. Not surprisingly, the most elaborate administrative structure was developed in India, especially after the British replaced government by the East Indian Company with direct colonial

rule after the Indian Rebellion of 1857. General policy was set by the London-based secretary of state for India and a 15-member Council of India. In India itself, administration was under the authority of a governor-general, or viceroy, under whom served provincial governors, commissioners, residents, agents, and approximately 1,500 largely British members of the India Civil Service. Indians filled the lowest ranks of the colonial administration as clerks and minor officials and provided the soldiers for the 200,000-man Indian Army. This was a far cry from the tiny number of officials dispatched by the Western powers to administer their new colonies in the Pacific.

How the people of Asia and Oceania responded to their new colonial status differed over time and from colony to colony. The first anticolonial nationalist movement developed in the Philippines, where festering discontent with Spanish rule erupted into revolution in 1896 and the founding of a short-lived independent Philippines in 1898. Filipino nationalists continued to fight for independence after the U.S. annexation in 1899. By the late nineteenth and early twentieth centuries, nationalist movements were gaining strength in India, where disenchantment with British rule was growing among all social groups and Hindus and Muslims alike, and in Vietnam and Burma, where significant numbers had never reconciled themselves to the imposition of European rule. Ethnic and religious differences and low educational levels meant that nationalists in the Dutch East Indies had few followers before World War I. In British Malaya and the French protectorates of Laos and Cambodia, where colonialism was perceived as having brought certain economic benefits and traditional rulers were preserved, there was no concerted nationwide opposition to colonial rule until well into the twentieth century. The same is true in the Pacific islands, where frustration with colonialism expressed itself in non-cooperation, infrequent strikes and boycotts, and a few instances of rebellion, such as the Sokeh Revolt on German-controlled Pohnpei Island in 1911. But among these recently colonized peoples, few in number, isolated, and traumatized by epidemics, forced labor, and social disintegration, independence movements could

hardly have been expected to begin, let alone flourish, before 1914.

British Administration in India, 1756–1858

The creation of a British administration system in India in its first century of control was done in an ad hoc manner, as the British East India Company attempted to bring administrative order to the various areas it controlled. Financial administration was the first consideration, followed by the need for imposing a uniform legal system. The administrative measures that it took reflected these priorities.

On August 12, 1765, the Mughal emperor issued an edict proclaiming the East India Company the *diwan* (civil and revenue administration) for Bengal, Bihar, and Orissa. As a result, the British were transformed from traders to rulers in India. Robert Clive (1725–1774), commanding the forces of the British East India Company, had laid the foundation for British rule by his military conquest of Bengal in 1757. The diwan was the first step in the creation of British *raj* (rule) in India, although at this point the company was unready to assume complete administrative responsibility. It employed Indian agents to collect revenue, and the provinces of Bengal, Bihar, and Orissa remained under the jurisdiction of Mughal governors, who maintained judicial authority.

In 1767, corruption by its officials and wars prevented the company from paying its annual tax of £400,000 to the British treasury even though many company officials who came to be known as nabobs were acquiring vast fortunes. The company's request for a government loan led to an official inquiry and the passing of the Regulating Act of 1774, which was the first step in the gradual extension of the British government's authority over the East India Company's possessions in India. Warren Hastings (1732–1818) was designated governor-general with powers over the presidencies of Bombay (Mumbai) and Madras, and a supreme court was created in Calcutta (Kolkata). Hastings reorganized the Revenue Department and extended company administration in Bengal. The India Act of 1784 provided for

INDIA UNDER CORNWALLIS

further control of the company's actions by the British Parliament. A Board of Control appointed by the British government could now send secret orders to the governor-general, thus undermining company directives. The company's directors

retained patronage rights to make appointments of officials, but the board could recall anyone in the company. Hastings resigned in the face of his loss of authority, as he could no longer act in the independent manner he had in the past, and

Lord Cornwallis (1738–1805) became not only the governor-general but also commander in chief of the Indian Army.

Cornwallis enacted the Code of Forty-Eight Regulations (also known as the Cornwallis Code) in 1793, which set enduring standards for the administrative services, revenue collection, and the courts. His Permanent Zamindari Settlement introduced the concept of alienable private property into Bengal. Relationships between landowners and cultivators had traditionally been a reciprocal one, a communal relationship. Under the Zamindari Settlement, land became merely private property and hence could be bought and sold by anyone, irrespective of the person's ties to the community. Cultivators who could not pay their debts were simply evicted. This new principle of landownership in India tore apart traditional *zamindar* (landowner)-cultivator relationships and created a new class of absentee landlords, many of them bankers who embraced Western education and became loyal to the British.

Cornwallis also created provincial circuit courts presided over by British magistrates who had both police and also judicial functions. These new provincial courts introduced English common law to India. Cornwallis's regulations also established the office of collector, who was responsible for all aspects of administration within the districts in the provinces. The code also gave the British the right to abolish all traditional taxes and impose their own. Cornwallis also made the sale of salt and opium a company monopoly. In addition to these administrative changes, Cornwallis also waged war in Mysore, thereby extending British territory and its administrative system in the south.

Most elements of this new administrative system were extended to other parts of India after the British fought the Anglo-Mysore Wars (1767–1799), the Anglo-Maratha Wars (1775–1819), and the Anglo-Sikh Wars (1845–1849), although in Madras a settlement directly with the cultivators, the Ryotwari Settlement, was introduced instead of the Zamindari Settlement. In 1809 the company founded the East India College at Haileybury to train British administrators to carry out these administrative reforms.

It produced some 2,000 administrators over the next 50 years.

The company's administrative practices came under intense parliamentary scrutiny during the debates over the renewal of the company's authority in India in 1793, 1813, 1833, and 1853. Although the Charter Acts passed in these years extended company rule, they also included a number of administrative changes. In 1813, for example, the company lost its trade monopoly except in salt and opium. Missionaries were admitted to India, and Western education expanded in India with a direct grant from the company for schools. In 1818 the first public library was opened, and traditional Indian education and Western education were offered. In 1833, the company was required to discontinue all commercial operations as a result of the victory of free trade principles in England, and the company governed India on behalf of the Crown through the governor-general and his counselors. These officials were given control of the finances of Bombay and Madras, which had previously been administered independently. In 1853 the law member, who was responsible for the British legal system in India, became a member of the Governor-General's Council, and the central government increased its control of the legal system through the country. These were all measures that led to the eventual liquidation of the company in 1858 after the Indian Mutiny.

Between 1756 and 1858 the British brought administrative order to a country that in all its history had never had strong central control before or been governed in a uniform manner with one administrative, legal, or financial system. In 1756 it found inchoate governing practices in imperial cities, rural districts, and tribal areas that were based on a bewildering array of different caste, regional, customary, tribal, and religious practices. Slowly but surely, as the company added territory almost every decade to its empire in India, it created and spread an administrative system to all of the territories it controlled. In 1858 it handed over to the British government an administrative system that became the basis of the British raj in India.

The Indian Mutiny

The Indian Mutiny of 1857–1858 was a determined, if disorganized, effort mainly undertaken by Indian soldiers, or sepoys, who served in the Bengal army, the largest of the three armies maintained by the British East India Company in India. Their goal was to end the company's dominance over India. The word "mutiny" was first used by British historians in the nineteenth century to indicate an illegal action against British authority, but many scholars, especially Indians, tend to characterize the rebellion as an act of resistance to foreign rule and hence refer to it as India's First War of Independence.

Many factors led to this event. Many Indians had suffered economically under British rule. The flourishing Indian cotton textile industry had almost been destroyed by British policies of protecting their own markets and using India as a captive market for its own products. The agricultural revenue structure introduced by the British in some parts of India through the Permanent Settlement Act of 1793 increased the burden of taxes on the peasants and made tax collection more ruthless. The British encouragement, if not coercion, of Indian peasants to cultivate commercial crops such as cotton, jute, tea, indigo, and opium rather than food products led to food scarcities and, when exacerbated by drought, widespread famine. Finally, there was the gradual drain of wealth from India that, in many ways, depleted India for the benefit of Britain. The only groups that benefitted economically from company rule were the comprador bourgeoisie (trading and commercial classes who profited from their association with the British), the *zamindari* classes (the new land-owning gentry that British agricultural policies

created), and those who directly entered company service.

In addition, the assumption of new administrative responsibilities by the British and their expansion into new territories in the early 1800s alarmed many Indians. The British gradually evolved from being traders to being tax collectors, providers of law and order, and eventually direct administrators of different provinces. The older Mughal administrative elite felt progressively marginalized, and the emperor himself eventually became little more than a cultural token with only partial jurisdiction over a city. Moreover, the British were acquiring territories either through outright conquest (Sind in 1845 and Punjab in 1849) or through the application of the Doctrine of Lapse enunciated by Lord Dalhousie, governor-general of India during 1848–1856, that allowed the company to annex any Indian princely state (e.g., Satara, Jhansi, Oudh) that did not have a direct male successor after the death of a local ruler or was simply considered to be incompetently administered.

Christian missionary activity also generated concern among many Indians (particularly Muslims), while certain social reforms supported by the British, such as banning widow self-immolation and child marriage, were perceived as threats to native religious traditions. In addition to the growing unease about British rule in the general population, the company faced growing dissatisfaction in the ranks of the Indian army. The armies of the company were overwhelmingly native. By 1856, there was a total of about 43,000 British troops and more than 223,000 Indian soldiers in the company forces. However, Indian soldiers were poorly paid and shabbily treated, and they complained about pensions and promotions and were resentful of being deployed outside of India.

Military and religious resentment became explosively intertwined with the introduction of the new Lee-Enfield rifles in 1857. It was widely believed that the cartridges, which had to have the ends bitten off before being loaded, were greased with fat from pigs (considered unclean by Muslims) and cows (deemed sacred by the Hindus). In February 1857 the troops of the Bengal infantry refused to use these cartridges, and in March

THE LAST MUGHAL RULER

Emperor Bahadur Shah was the last Mughal ruler of India and the person who lent his symbolic authority to the rebellion, even though his experience and temperament were completely unsuited to that role. Born in 1775 to Emperor Akbar Shah and to his Hindu mother Lalbai, Bahadur ascended the throne in 1838. His coronation titles certainly did not reflect his limited power. He was an enlightened man of refined manners, authored many romantic and mystical poems (under the name of Zafar, which, ironically, means “victor”), and was an enthusiastic patron of the arts. He encouraged a rich and vibrant cultural life in Delhi. In 1857 he agreed to become the nominal leader of the mutinous troops in 1857 by agreeing to lend his symbolic authority to the rebellion, even though his expectations were unclear. After the rebellion he was found guilty of treason by British authorities and exiled to Rangoon, where he lived in undignified conditions in British custody (with vivid memories of some of his own children and grandchildren gruesomely killed by British forces). He died in Rangoon (present-day Yangon, Myanmar) and was hastily and unceremoniously buried by imperial troops.

—Ahrar Ahmad

a native soldier named Mangal Pandey fired on a British officer to register his protest. Finally, in April in Meerut, the Indian soldiers, joined by some townspeople, rose up in open revolt, massacred most of the British, and marched toward Delhi. They took the capital in May, killed all the British residents and soldiers who could not escape, and proclaimed the Mughal ruler the emperor of India. These events were spearheaded by Indian troops, often led by rulers and elite of the princely states and vestiges of the Mughal nobility, and received enthusiastic, if sporadic and localized, support from ordinary people.

It should be pointed out that the rebellion was mainly focused on the upper Gangetic plains, which constitute parts of present-day Uttar Pradesh, Bihar, northern Madhya Pradesh, and the Delhi region. Most of the Bombay and Madras presidencies and much of the country did not join in this effort. While the fighting was most intense in some of the princely

states (particularly those where the rulers had been deposed), many other such states (Hyderabad, Mysore, Travancore) remained aloof. Even the Bengal Army, which formed the core of the uprising, did not represent a united front in its opposition to the British, and some segments of the military, such as the Punjab and Gurkha regiments, actually supported the British. Also, solidarity and resolve were eroded by disagreements among the Indians over tactics, leadership, and jurisdictions, which led to dissension among Shia and Sunni, Hindu and Muslim, and easterners and westerners. Nonetheless, as a direct challenge to British rule, the event acquired huge symbolic significance and later inspired much romantic lore and patriotic sentiment.

The superior strategy, weaponry, and organization of the British ultimately prevailed over the spontaneity and passion of the Indians. Delhi was retaken by the British in September 1857, while other centers of rebellion were pacified with vengeful authority. British operations were carried out with a merciless zeal (particularly in Delhi) that was both overwhelming and horrific. The events had several consequences. Parliament terminated the operations of the East India Company, and the Crown assumed jurisdiction over India. The Doctrine of Lapse was renounced, and new understandings were reached with the princely states. Mughal rule formally ended. The Bengal Army was all but disbanded, new units were recruited, and new arrangements of command and control were instituted. The British administrative and financial system in India was also incrementally reorganized, and more attention was paid to education, employment, and the participation of Indians in their own governance through their gradual incorporation into the Indian civil services and as participants in the Indian legislative councils.

British Administration in India, 1858–1914

The British government assumed formal responsibility for the administration of India after the Mutiny of 1857, and the East India Company, which for some years had governed India in name only, was liquidated. By the Government of India Act of 1858, a new secretary of state for India assumed direct responsibility for administering India on behalf of the Crown. He was assisted by a Council of 15 members, 8 of whom were appointed by the British government and 7 of whom were elected, first by the outgoing East India Company to ensure some semblance of continuity and then by the Council members. The Crown was represented by a viceroy, who was also the governor-general. As the British believed that the mutiny had been caused by interference in Indian social and religious affairs, they avoided direct socio-religious reforms for three decades. However, British administrative control extended in area and depth, with each of India's 235 districts headed by a British administrator. Such departments as Accounts, Archaeological Survey, Customs, Education, Forests, Geological Survey, Jails, Meteorological Survey, Mint, Opium, Pilot Service, Post Office and Telegraph, Police, Public Works, Registration, Salt, and Survey, operating directly or through local dignitaries or village headmen, took British ideas of good government even to the villages.

In 1861 the government passed the first of a number of Indian Councils Acts that entrenched the British form of administration in India. Legislative power was handed to Madras and Bombay, and new councils were created for Bengal (1862), the North-West Frontier Province (1886), and Burma and the Punjab (1897). These councils were all confined to legislative matters whose laws had to be approved by the governor-general. In 1861, the governor-general's Executive Council was expanded from 4 to 5 members with the addition of a jurist. A commander in chief was an extraordinary member of the Council. Cabinet government was introduced through an expansion of the governor-general's Legislative Council, which consisted of up to 12 members, half of whom were government officials serving in one of the administrative services,

and were nominated for two years. Without consent of this council, the governor-general could issue ordinances valid for six months only. Indians were appointed by the governor-general to the newly created Legislative Council. This system was mostly replicated in the provinces under a governor assisted by an advocate-general and a council of 4 to 8 members, half of whom were local government officials. This system expanded British administration into almost every facet of Indian life and remained in place until the end of British rule in 1947. In 1886 the Public Service Commission was appointed and led to the creation of the Provincial Public Service, which supplemented the Indian Civil Service. Both were opened up to Indians, although only 69 Indians were employed in the Indian Civil Service by 1886.

In the Indian Councils Act of 1892 the governor-general's Legislative Council was expanded to 16 members, who were to be nominated by municipalities, university senates, and trade associations. This system was emulated in the provinces, where each council had a maximum of between 15 and 20 members. The governor-general's council also received Indian representation. Indirectly, the act introduced the elective principle into India. Its effect was to expand Indian representation in the councils where officials were required to defend administrative measures. It made administration in India more sensitive to local feeling, although control remained firmly in official British hands.

In 1908 the British Parliament appointed a commission to study the relationship between the provinces and the central government in Calcutta (Kolkata) in order to simplify administrative control and further extend central executive power into the provinces. This led to the Government of India Act of 1909, known as the Minto-Morley Reforms, after the governor-general Lord Minto (1845–1914), viceroy during 1905–1910, and John Morley (1838–1923), secretary of state for India during 1905–1910. It enlarged the Indian Legislative Council to 60 members and the provincial assemblies to 50 members; it also required that in the provincial assemblies nonofficials would be in the majority for the first time. Separate electorates were created for Muslims, landholders, chambers of

commerce, and universities. Legislatures were given the right to discuss budgets, and as a result, spending on local administration came under the purview of Indians. This was the basis of the Government of India Acts of 1919 and 1935 and the system of administration that the governments of India and Pakistan inherited in 1947 and administered through the Indian Civil Service and the Pakistan Civil Service.

The Beginnings of Indian Nationalism

For centuries, Hinduism had given a sense of unity to some Indians. So too did the shared experiences of Mughal and British rule, and the nineteenth-century improvements in communications. These bases of unity were now joined by Indian nationalism.

Nationalism is based on the idea that individuals are part of a group called a nation, united by a common history, language, and culture. It originated among eighteenth-century European intellectuals, who argued that the ideal country was built around a nation rather than a dynasty or a church. In the following century, nationalism spread across Europe, where it led to the unification of Italy and Germany and to calls to dismantle the multinational Austrian and Russian empires.

Familiarity with Western political thought introduced nationalism to English-educated Indians. Some saw separate nations in speakers of each Indian language and wanted political boundaries to reflect this. For example, Oriya nationalists demanded a homeland for speakers of their language, who were spread across

three provinces. The British granted this request when they established the province of Orissa in 1936. Many speakers of Dravidian languages in South India came to see themselves as a nation, oppressed by the Hindu religion of the North and its Brahmin agents.

Subcontinental nationalism had a problem in that India lacks the common language or culture that defined nations in Europe. Some nationalists sought to bind the Indian people with a shared commitment to political liberalism, which they believed could only be instilled by continued British rule. Others looked to the very diversity of India as the basis for the nation and found among their compatriots a unique tolerance that allowed different cultures to coexist and to enrich one another in a composite Indian civilization. For example, *Jana Gana Mana*, now the national anthem of India, was written by modern India's greatest poet, Rabindranath Tagore. Rabindranath, the son of Debendranath Tagore of the Brahmo Samaj, was the winner of the 1913 Nobel Prize in Literature. *Jana Gana Mana* celebrates the common Indianness of the whole subcontinent: Punjab, Sindh, Gujarat, Maharashtra, the South, Orissa, Bengal; the Vindhya, the Himalayas, the Yamuna, the Ganges; the waves of the Indian Ocean.

Opposing these secular nationalisms, Hindu nationalists asserted that Hinduism was a foundation for not merely the cultural unity of the subcontinent but a modern Indian nation. The differences among all these strains of nationalists are illustrated in their attitudes to the seventeenth-century Maratha king Shivaji. To non-Brahmins, Shivaji was a valiant enemy of upper-caste privileges. To Maharashtrian regionalists, he fought for the independence of Maharashtra. Secular nationalists saw him as an Indian patriot, and Hindu nationalists as the founder of a Hindu state.

With its assumption that a country is tied together by its inhabitants, nationalism implies that the people have a shared interest in the country and are therefore entitled to a say in its government. In the 1860s, Indians were admitted to the formal structures of government in British India with the establishment of local boards. These had the power to impose taxes, and spend them on schools, drains, and other local purposes.

Their members were mostly Indians, initially named by the government but from the 1870s elected by men wealthy enough to pay the property tax. The boards served as a safety valve, giving Indians real power but at a level where they could not threaten British interests.

English-educated Indians, including many nationalists, wanted more than control of local boards. One of their concerns surrounded the highest level of government employment, the Indian Civil Service or ICS. ICS officers enjoyed good salaries and considerable prestige. The British parliament had banned discrimination against Indians in government appointments in 1833, but there were practical barriers. Since 1855, the ICS had recruited officers with an examination that was offered only in London. A greater hurdle came when the maximum age for taking the examination was lowered to 23 in 1858 and to 19 in 1876. This was intended to let successful candidates attend a British university before going on to India. However, the examination was based on the English school curriculum, and anyone who had not spent several years at school in England found it difficult to pass. The lower the age, the harder it was for Indians to obtain the necessary prior education.

The educated also wanted a part in lawmaking in British India. By the early 1860s, the viceroy and provincial governors each had legislative councils to discuss proposed new laws. All their members were chosen by the viceroy or governor. Most were British government officials, but there were also a few private citizens or “unofficial members.” These included princes, landowners, and urban community leaders. Many educated Indians felt that nominated unofficial members did not represent them. They wanted “unofficials” to be elected, and to enjoy the right to initiate legislation as well as discuss it.

The power to reform the councils and the ICS lay with the central government in Calcutta and the British parliament in London. In 1866, a group of Indians in Britain founded the East India Association to discuss Indian affairs and bring their grievances before the British authorities. In India, such bodies as the Poona Sarvajanik Sabha or Association of All the People of the city of Poona petitioned the government on the ICS, the councils, and other issues.

In 1883, the government of India unveiled the Ilbert Bill, a proposal to rescind the right that Europeans in rural Bengal enjoyed not to be tried by an Indian judge if they landed in court. Bengal’s British businessmen and planters were outraged, claiming that Indian judges did not share Western conceptions of right and wrong. They launched a campaign of petitions, speeches, and lobbying, until the government watered down the Ilbert Bill to their satisfaction. The episode showed Indians the power of public opinion, if it was channeled properly.

In 1885, members of the educated elite from all over India met in Bombay to discuss means of bringing pressure to bear on the government. They called themselves the Indian National Congress, or Congress, and from then on met in a different city each year during the Christmas vacation. Indian nationalism had reached a new and important stage in its development.

The Founding of the Indian National Congress

By the end of the nineteenth century, a growing middle class of educated Indians began to advocate for a larger role in the political and economic administration of India. In response, several groups were organized that sought to achieve this goal, but the Indian National Congress (INC), which first met in Bombay (Mumbai) in 1885, was by far the most important. Initially the INC was encouraged by retired British civil servant Allan Octavian Hume, politician and economist Dadabhai Naoroji, and a number of middle-class Indian businessmen and

➤ DADABHAI NAOROJI

Dadabhai Naoroji, a Parsi (Zoroastrian Indian) born in southern Gujarat in 1825, was one of the influential founding members of the Indian National Congress. Naoroji was a well-educated businessman concerned with the future of Indian spirituality and the ethics of Indian politics as well. Having attained a prestigious academic position at the Elphinstone Institution in 1850, the first Indian to ever do so, Naoroji went on to become a member of Cama and Company, the first Indian merchant company to establish offices in Britain. Naoroji helped to open an office in Liverpool but resigned in 1858, citing ethical concerns. In 1859 he established his own cotton trading company while also taking a position at the University College of London. In the early 1860s Naoroji

returned to India to help establish a voice for Indians in the running of their own country. In 1867 he established the East India Association, a forerunner of the Indian National Congress (INC). Naoroji was elected president of the INC in 1886. The remainder of Naoroji's life (he died in 1917) was spent traveling between Great Britain and India. In 1892 he won election to Parliament, the first Indian to do so, for Finsbury Central. Later, in 1906, he was reelected president of the INC. Politically Naoroji was a moderate, seeking to find compromise among the various factions within Indian politics, having worked alongside the Muslim leader Muhammad Ali Jinnah and Mahatma Gandhi.

—*Maryanne Rhett*

intellectuals. Unlike most other organizations, the INC, under Hume's guidance, strove to be multiethnic and secular. At first the INC's goals focused on protecting the economic and political interests of India's growing educated middle class, not (as was the later case) developing a universally democratic body for the protection of Indian rights more broadly nor advocating Indian independence from Great Britain. However, by the turn of the twentieth century, as imperial structures came to be seen as increasingly intolerant and racist, the INC was transformed into a mouthpiece for native democratic tendencies.

The initial structure of the INC offered a small well-to-do number of Britain's Indian subjects an organization through which they could present grievances and raise issues to the British Crown in an organized and systematic manner. The outlet offered by the INC's annual meetings was considered an ideal resource, if not a crucial resource, for venting their frustrations and anxieties. In particular, the question of racial equality between well-educated Indians and Europeans was central to the INC's early concerns. The controversy surrounding the 1884 Ilbert Bill was perhaps the most important testing ground for the questions of racial equality and Indian politics. The bill rectified a loophole in the judicial system that had disallowed native Indian judges from trying cases involving Anglo-Indians

(Britons living and working in India). Anglo-Indians reacted vehemently against the Ilbert Bill. At the heart of this reaction was the implied question of Indian abilities at self-governance: If an Indian judge is fit enough to try a European, why then is he not fit enough to run his own country? India's educated middle class, many of whom had been educated in European Enlightenment ideals, became increasingly convinced that the institutionalized racism of British imperial policy needed to be changed.

Amid the upheaval of the Ilbert Bill crisis, Allan Octavian Hume campaigned among the graduates of Calcutta (Kolkata) University for the creation of an organization that would work toward ending such unfair and unequal treatment of Indians. Hume, the "Father of the Indian National Congress," was born in 1829 in Kent, England, and joined the Bengal Civil Service in 1849. His service in India was marked by his ideals for political reform. Aside from his role in the founding of the INC, Hume was active in establishing free schools and encouraging political activity among his many Indian contacts.

In comparison to the later divisions that defined the INC after the turn of the twentieth century, the early years were marked by caution, moderation, and secularism. The INC met regularly and spoke out on a number of important matters concerning Indian politics and economics

but tended toward a moderate political agenda, its largest concern eventually becoming the creation of a functioning Indian parliament, one that would work *within* the superstructure of the British Empire. However, while this period of seemingly flexible and moderate growth had its advantages, attaining an Indian parliament would have failed had it not been for the aid of activists and lobbyists in London.

The year 1892 proved to be an important turning point for the INC. For the first time in British history, an Indian, Dadabhai Naoroji, who was president of the INC in 1886, was elected to Parliament and served in the House of Commons between 1892 and 1895. During his lifetime Naoroji worked to help secure the future of the INC. Naoroji's Indian National Association, based in Calcutta, merged with the Bombay-based INC in the 1880s, and Naoroji is generally credited with being a founding member of the INC. Also in 1892, the India Councils Act, first established in 1861, was updated to strengthen the ties between the office of the viceroy and the Indian populace. The most notable change was the increase in the number of Indian representatives appointed to counsel the governor-general on matters relating to budget and the administration of the Indian civil service. This step increased native Indians' participation in running their own state and helped strengthen the movement to establish an Indian parliament. Finally, 1892 marked the departure of the INC's founding father, Allan Hume, who returned to England. While the events of 1892 did not actually lead to immediate self-rule, the INC was strengthened by the liberalizing tone of British imperial policy and the increased participation of well-educated and well-to-do Indians, if increasingly Hindu in majority.

Although Hume had encouraged Muslim attendance at the INC, his final exit marked a shift in the thinking among Muslims and their relationship with the INC. In the 1890s new INC leaders appeared, most notably Bal Gangadhar Tilak, who in 1894 resurrected Hindu festivals in his region of Maharashtra to encourage Indian national consciousness. Tilak's involvement in the INC and the eventual debate over home rule led the INC into a period distinctly different from its founding phase. Further splits,

evidenced throughout India but noted among the politics of the INC, developed when prominent Islamic leaders such as Sayyid Ahmed Khan spoke in opposition to the INC's largely Hindu membership and urged Muslims not to join. For Khan and other Muslim leaders, membership in the INC did not reflect the nature of the religious structure of India. Similarly, dissent from non-Muslims swelled in the late 1890s in reaction to the perception that the INC, with its limited and private membership, was an elitist and largely Anglophone organization out of touch with the desires of the majority lower-class Indians. The resentment toward the INC, carried by various groups throughout India, indicated the future trends in the party's existence, particularly as global events accelerated changes in imperial structures in the early decades of the twentieth century.

European Colonialism in Oceania

Island Oceania stretches from the eastern Australian and New Zealand seaboard to the South American coast, encompassing the three main island groups of Micronesia, Melanesia, and Polynesia. Mainland Oceania includes Australia and Papua New Guinea (the eastern half of the island). In the nineteenth century this vast area was subjected to colonial rule by the Western powers: Great Britain, France, Germany, Spain, and the United States.

Australia (the Aboriginal groups did not have a specific name for this continental landmass)

was claimed for Great Britain in 1770 by James Cook. British colonialism took the form of penal colonies there from 1788 onward; few other strategic motives were advanced at the time. European (mostly British) emigration took hold in the nineteenth century, and in 1901 after federation, which gave birth to the Commonwealth of Australia, effective British colonial influence in the area declined, although New Zealand remained a British possession until 1947. In New Zealand no coherent bureaucratic or military mode of colonization was put into effect until the appointment of James Busby in 1832 as first official British resident. Until then, missionaries such as Samuel Marsden had attempted to secure religious footholds in New Zealand from 1814 to 1837, and these efforts and various commercial ventures eventually culminated in the territory's recognition as a British colony in 1839. Settler colonization took root after the acceptance in 1840 of the Waitangi Treaty, which transferred ownership of Maori lands to the British Crown.

European colonialism in the Pacific islands began with the Spanish annexation of Micronesian island groups in the sixteenth and seventeenth centuries. These Spanish colonizers retained control over the Marianas (today called the Commonwealth of the Northern Mariana Islands, of which Saipan, Rota, and Tinian are the main islands) and the Carolines (today called the Federated States of Micronesia, of which Yap, Chuuk, Pohnpei, and Kosrae are the most heavily populated) for just over 350 years. After the Spanish-American War, Guam (Guahan) came under U.S. control in 1898 after the Treaty of Paris was signed. Spain had granted trading rights in the area to Germany in 1885, and after the war the Marianas and the Carolines were sold to Germany in 1899. The Spanish had not intensively colonized this area, and when Germany took over, trade was the principal concern. The German initiatives were short-lived, however, as World War I and the Japanese-British alliance put an end to Germany's hold on the Micronesian territories in 1914.

Western colonialism came later to the island groups in the Melanesian chain. The Spanish, Germans, and British successively laid claims to the Solomons. Spanish navigator Álvaro de Mendaña discovered the islands in 1568, but

because they were inaccurately mapped they were lost to the world until the late eighteenth century. Germany had already colonized mainland New Guinea and went on to annex the northern Solomons (including Bougainville and Buka islands) in 1885, again with a view to consolidating their trading interests (for example, the recruitment of plantation workers by labor traders). Settler colonization (as in Australia in the mid-nineteenth century) did not occur, but plantations were set up, and missionaries (Anglicans, Catholics, Methodists) established permanent missions from the end of the nineteenth century onward when Germany and Great Britain agreed to joint administration of the island group in 1886. In 1894 the first British resident commissioner, Charles Woodford, was dispatched to the Solomons (N'gela). His major preoccupations were pacification and facilitating exports of rubber and copra.

Another Melanesian island, New Caledonia, was discovered and claimed for Britain by James Cook in 1774 but did not become a British colony. The London Missionary Society (active in Polynesia) did little to introduce missionaries in the area. In 1853 the island was annexed by France in an attempt to attenuate widespread British influence in the Australian and New Zealand colonies. A penal colony was established there in 1864, and land grant policies in favor of convicts encouraged cultivation of the land. From the 1860s onward the appropriation of Kanak lands intensified, and huge tracts were conceded to individual settlers. The number of incoming colonizers grew significantly after World War II.

Portuguese explorer Fernandes de Queirós headed a Spanish expedition across the Pacific and discovered Vanuatu in 1606 and claimed it for Spain. He thought that he had set foot on the great South Land. More than a century later Vanuatu was rediscovered by the French (Bougainville in 1768) and later the British (James Cook in 1774), who subsequently divided up these islands between themselves. From the 1840s onward British and French missionaries consecutively set up missions there. British (from Australia) and French (from New Caledonia) settler colonialism took hold, but tensions between these two European communities and between the Europeans and the islanders led to

DISCOVERY OF FIJI

William Bligh had been set adrift in a longboat with 18 others after the mutiny on HMS *Bounty* led by Fletcher Christian on April 28, 1789. This passage describes the first sighting of Fiji as recorded by William Bligh in 1789 in the journal he kept in the launch that was published in 1792 along with the narrative of the voyage to Tahiti.

“Thursday 7th May, 1789

The land in the west was distinguished by some extraordinary high rocks, which, as we approached them, assumed a variety of forms. . . . [W]e observed two large sailing canoes coming swiftly after us along shore, and, being apprehensive of their intentions, we rowed with some anxiety, fully sensible of our weak and defenceless state. . . . Being constantly wet, it was with the utmost difficulty I could open a book to write, and I am sensible that what I have done can only serve to point out where these lands are to be found again, and give an idea of their extent. . . . Only one of the canoes gained upon us, which by three o'clock in the afternoon was not more than two miles off,

when she gave over chase. If I may judge from the sail of these vessels, they are of a similar construction with those at the Friendly Island, which, with the nearness of their situation, gives reason to believe that they are the same kind of people. Whether these canoes had any hostile intention against us must remain a doubt, perhaps we might have benefited by an intercourse with them; but in our defenceless situation, to have made the experiment would have been risking too much. I imagine these to be the islands called Feejee, as their extent, direction, and distance from the Friendly Islands, answers to the description given of them by those islanders.”

William Bligh, *A Voyage to the South Sea, Undertaken by Command of His Majesty for the Purpose of Conveying the Bread-Fruit Tree to the West Indies* (London: Published by Permission of the Lords Commissioners of the Admiralty, 1792), 182–183.

the establishment in 1906 of an Anglo-French Condominium, which ensured joint administration of Vanuatu and put in place land tenure arrangements.

Fiji was sighted by William Bligh in 1789 on his longboat journey across the Pacific after the mutiny on the *Bounty*. These islands were officially declared a British colony much later, in 1874. The purpose was to prevent any tribal warfare that might have compromised trading interests.

The Polynesian island groups include French Polynesia, Wallis, Hawaii, Easter Island, Samoa, the Cook Islands, Tokelau, and Pitcairn. The Polynesian islands were claimed by Samuel Wallis (1767) and James Cook (1768 onward) for Great Britain and served as a convenient stopover in subsequent voyages across the Pacific. Catholics and Protestants set up missions there, and the islands were annexed by France in 1842 with little protest from the British. However, no policy of settlement by French nationals was adopted at

the time except some tentative plans to set up penal colonies. Gradually, after much debate in France, French settlement of the islands got under way, and the various archipelagos are today known as French Polynesia.

The Wallis archipelago (named and claimed by British explorer Samuel Wallis in 1767) also became a French protectorate in 1842, and there was little reaction on the part of the British as France annexed these islands. Again, the French authorities did not institute any specific mode of colonization or settlement (except missions). Today, Wallis is still an overseas French territory. As far as the Hawaiian archipelago (called the Sandwich Islands on discovery by James Cook in 1778) was concerned, annexation by the United States took place in 1898. Hawaii became a territory in 1900 and a full-fledged state in 1959. From the beginning of the eighteenth century onward, the Samoan islands were successively and sometimes very briefly Dutch, French, German, and American.

The European scramble for the South Pacific and Oceania as a whole ended in the independence of many island nations from the 1960s onward. Nevertheless, France, the United States, Australia, and New Zealand still exercise considerable influence in the area thanks to direct control over some territories and to historic links with former colonies.

French Imperialism in Southeast Asia

French imperial ambition in Southeast Asia extends back to the seventeenth and eighteenth centuries, though it was during the nineteenth century that French ambition yielded territorial concessions and the eventual creation of French Indochina. The colony of French Indochina included the present-day states of Vietnam, Cambodia, and Laos. French imperial ambition was driven by a combination of religious, humanitarian, and economic motives as well as a desire to restore national prestige. The French created a complex administrative structure that co-opted local political institutions and applied a policy that shifted from one of assimilation to association with the native peoples.

French Indochina was an entirely artificial imperialist creation. It combined inhabitants with distinct cultures, histories, and societies whose people never accepted an Indochinese identity. France established its foothold in Southeast Asia with the acquisition of six provinces, known as Cochinchina, in southern Vietnam between 1858 and 1867. Through a series of military expeditions in the north and a war with China, France secured protectorates over Tonkin (northern Vietnam) and Annam (central

Vietnam) by 1885. In Cambodia, the French established a protectorate in 1867. Laos, which had only united at the end of the seventeenth century, formed the fourth French protectorate in 1893.

French administration in Indochina varied from region to region. Cochinchina, the first French colony, was directly administered by a governor and French colonial officials who answered to the colonial and naval ministries in Paris. Meanwhile, Tonkin, Annam, Cambodia, and Laos constituted separate protectorates and maintained *residents superieurs* under the authority of the French Foreign Ministry. After 1887 all five regions were brought under the local authority of a single governor-general based in Hanoi. In the protectorates, French officials maintained a parallel bureaucracy and ruled through the veneer of traditional indigenous institutions. For example, the Nguyen dynasty emperor continued to issue edicts that would be carried out by local mandarin officials. In reality, the French resident superieur approved all drafts of edicts, and French officials oversaw the bureaucratic functions of Vietnamese officials. By the 1890s the French governor-general appropriated the political power of the Nguyen emperor and his officials, leaving a corrupt and moribund institution.

French motives for imperial expansion in Southeast Asia were as varied as the political structure of the colony. The *mission civilisatrice* (civilizing mission) reflected the hope of Christianizing and “civilizing” the inhabitants. French Jesuit missionary activity in the region dates back to the seventeenth century. The preservation of Catholic lives, either missionaries or converts, or punishment for their deaths was a recurring pretext for French military expeditions that secured territorial acquisitions in Vietnam. French prime minister Jules Ferry (1832–1893) also espoused economic motives for imperial expansion. He argued that France’s future economic development required new colonial possessions for raw materials, vast potential export markets, and outlets for French investment. However, economic development in French Indochina came late and never produced the benefits touted by Ferry. Some French historians argue that imperial expansion was driven

by the idea of empire and a need for the restoration of national pride in the wake of the humiliating defeat at the hands of Prussia in 1870. The colonial endeavor thus glorified French civilization and culture, revived French pride, and provided economic fortunes that would be critical in a future rematch with Germany.

French policy toward their Indochinese subjects vacillated between assimilation and association. The original policy of assimilation intended to create Frenchmen out of Indochinese. Assimilation sought to impose French customs, French language, and French institutions upon the diverse inhabitants of the colony without consideration of their historical, cultural, or political traditions. Over time, the policy of association replaced assimilation. The policy of association implied that the colonies, though under the control of French officialdom, would gain a measure of political and economic independence. Furthermore, traditional indigenous institutions would remain and would retain their integrity. For example, the French decided to retain Vietnamese mandarins as local and provincial officials rather than remove all vestiges of the Vietnamese political structure.

French Indochina was an artificial creation with various internal complexities. During the twentieth century inconsistent political leadership hampered the development of the colony, and worldwide economic turmoil frustrated French control over the colony. Japanese occupation of French Indochina during the 1940s further weakened French prestige and provided the opportunity for an uprising under the leadership of Ho Chi Minh and his Viet Minh organization. After a sustained conflict during 1945–1954, the French defeat at Dien Bien Phu led to a complete French withdrawal from the region and the dissolution of the French Indochina colony.

Resistance to French Imperialism

Resistance to French imperialism in Africa and Southeast Asia can be divided into primary resistance, or confronting French conquests, and secondary resistance, or avoiding French colonial rule. Major wars in Algeria, West Africa, and Vietnam demonstrated how distinct indigenous traditions influenced local resistance to the imposition of French colonial rule. After France established colonial regimes, indigenous populations resorted to well-established methods to avoid colonial intervention and maintain some measure of autonomy in their lives. Confrontation necessitated a near continuous state of armed resistance to French intervention and subsequent rebellions during the period of French rule. Avoidance provided a nonconfrontational alternative to armed resistance that eventually ended in defeat for the indigenous states, which lacked internal cohesion, powerful allies, and modern military technology. This strategy of resistance included refusing to obey the orders of colonial officials, flight from French colonies, refusal to recognize French-appointed authorities and French policies or taxes, sabotage, and efforts to propagandize against French rule through print media or popular theater.

France's first determined effort to reestablish its overseas empire in the nineteenth century led to a protracted bloody conflict over Algeria in North Africa. Driven by a dispute over trade, France launched an invasion of Algeria in 1830 and easily defeated the Algerian dey. The conquest of the coast ignited a jihad, or holy war, by the Arab Berber population. Under the leadership of Abd al-Qadir, the fiercely independent rival clans temporarily united to resist French intervention. The clans shared a common language, religion, and culture and felt threatened by the imposition of a foreign religion, culture, and legal system. During the war, France resorted to scorched earth tactics, including destroying animals, firing crops, and massacring villagers, and began to exploit the fragile unity of the rival clans supporting Abd al-Qadir, who was finally captured and exiled in 1847. The conflict then transformed into a sustained rebellion as the French struggled to pacify the interior regions populated

by an elusive opponent who fled deeper into the desert rather than submit to French colonial rule. France declared victory in 1879.

In West Africa during the 1880s, French efforts to extend their trading interests farther inland led to a confrontation with the expanding Tukulor empire under Ahmadu Seku and the recently founded Mandinka empire under Samori Toure. Both Samori and Ahmadu initially pursued diplomacy to avoid confrontation. When diplomacy failed, the two African empires pursued independent policies. Ahmadu concluded an alliance with the French, who he believed would respect the integrity of the Tukulor empire. The French, however, had no intention of respecting the treaty and took advantage of an internal dispute to topple the Tukulor empire in 1893. Samori had built the Mandinka empire on the strength of this 30,000-man army, which used imported foreign weapons and maintained a strong sense of Mandinka nationalism. Yet he had no desire to confront the French Senegalese army with its heavy artillery and machine guns. To escape French pressure, Samori withdrew to the east, established a new base for his Mandinka empire, and sought protection from the British in vain. French forces, after suffering several defeats, eventually captured Samori in 1898. The inability of independent African states to overcome their rivalries and unite against the French as well as find powerful foreign patrons guaranteed their downfall.

In Southeast Asia, France slowly acquired control over Vietnam, Cambodia, and Laos, forming the colony of French Indochina. In securing this colony, France faced not only indigenous resistance but also international intervention. As French control of Vietnam extended to the Red River in the north, a Chinese pirate force known as the Black Flag Army arrived in 1882. This irregular army opposed French imperialism on behalf of Vietnam. When the Black Flags were driven out in 1883, the Qing dynasty in China responded by sending troops to the frontier where fighting erupted between the French and Chinese, leading to the Sino-French War in 1884. Resistance to French imperialist ambitions in Indochina not only combined indigenous forces but also incorporated an international dimension with the support of Qing China. However,

this support was insufficient to maintain Vietnam's independence.

In contrast to these examples of primary resistance to French imperialism, subject peoples struggled to resist French colonial regimes through nonconfrontational methods. The simplest form of avoidance resistance witnessed peasants moving away from French colonial footholds. As French territorial control expanded, flight became more difficult, and some resorted to refusing to accept French rule and the authority of French-appointed officials. This might take the form of failure to acknowledge or pay new taxes established by the French. In the early twentieth century, anti-French propaganda could be found in print media in Africa and expressed in popular theatrical productions in Vietnam. Slowly, these forms of resistance, both primary and secondary, would coalesce and enable the subject peoples to unify and overthrow French colonial rule.

Reform and Innovation in Siam (Thailand)

As with China and Japan, the two major Asian countries not to have been directly colonized by the West, Siam (now Thailand) faced three challenges beginning in the mid-nineteenth century: keeping colonialism at bay, strengthening the country by learning from the West, and retaining what were considered the essential attributes of the society. In Siam it was the royal family rather than intellectuals or military men who managed the country's efforts to modernize.

According to King Chulalongkorn (r. 1868–1910), who formulated the blueprint for reforms,

the traditional institutions of government had become inefficient and corrupt. Noble families had entrenched themselves in territorially defined offices, living off the labor and taxes of the people while failing to provide justice and security of livelihood. The king thus moved to dismantle their power bases by introducing a modern bureaucratic system based on functional differentiation, fully accountable to the minister and in turn the monarch. These pivotal reforms have long been understood, in Chulalongkorn's terms, as the demarcation between old and new Siam, the long-drawn-out battle between the conservatives and modernizers in which the latter eventually triumphed. Had they been defeated, the argument went, Siam would undoubtedly have been colonized along with the other Southeast Asian countries, as the Western powers were intent on supplanting rulers and systems that were opposed to open markets and modern administrations.

Chulalongkorn's reforming zeal was not only a response to the threat of colonialism or a legacy of poor administration; to him, both could only be addressed with the revival of the fortunes of the Chakri royal family. The dynasty had lost out in relative strength to the powerful noble families, in particular the Bunnag, who were instrumental in the selection of Mongkut (r. 1851–1868), then a monk for 27 years, to the throne upon the death of his half brother King Nangklao (1824–1851), and whose scion Chuang was regent for 5 years until 1873, when Chulalongkorn turned 20.

Chulalongkorn's mark as a modernizer had actually been stamped during the regency. In 1871–1872 Chuang Bunnag arranged for him to visit Java, the Straits Settlements, British Burma, and India to acquaint him with the workings of the colonial possessions. These visits marked the first time that a Siamese monarch had ventured abroad. In 1874 Chulalongkorn announced that all children born into debt slavery at the beginning of his reign who had not been redeemed earlier would be free when they were 21 years old. The colonial powers did not fail to take note of this dramatic though long-drawn-out rupture with what they considered one of the worst features of an uncivilized society. At the same time, the control of labor services as the key to resource

extraction was growing anachronistic, for the open-market economy functioned on wage rather than *corvée* labor, and monetization meant that taxation became the key source of state revenue.

With the creation of the functional ministries in 1892, the Ministry of Finance had charge of revenue collection and the expenditures of the kingdom, allocating funds for infrastructure development that aimed at the centralization of power, which would also facilitate the operations of the Western businesses. The intertwined interests were manifested in the appointment of foreign advisers not only for their technical skills but also for their policy recommendations: British (financial, British companies having the largest economic interest in Siam); French, Belgian, and Japanese (legal codes); Danish (navy and the *gendarmerie*); and German (railways and the post office).

The monarchy consolidated its rule through the reforms, in particular those of the Ministry of Interior, which enforced edicts from Bangkok in remote and autonomous regions such as forest resource-rich Chiangmai (Chiang Mai). The extension of a uniform taxation system to the subsistence economy of the northeast erupted in millenarian uprisings in 1902 that were put down by the modernized army dispatched on newly built railways.

Chulalongkorn tightly controlled the scope and pace of the modernization program, rejecting a petition in 1885 from a group of princes and officials for a constitutional monarchy and a parliamentary system. The king deemed that the small number of educated Siamese and the urgency of the colonial threats meant that political and legislative reforms were premature. Similar calls for reforms made by commoners through the press up to the 1932 overthrow of the absolute monarchy also went unheeded.

The Dutch East Indies

Since the seventeenth century, Dutch interests in the Malay Archipelago were represented by the United Dutch East India Company (VOC), a joint stock company that established a lucrative commercial network in the region but little territorial control. After the VOC went bankrupt in 1796, its charter was allowed to lapse in 1800 and the Dutch government assumed its responsibilities and rights in the region. Between 1808 and 1811, the territories were administered by Willem Daendels, who was appointed by Napoleon after the French emperor created the Kingdom of Holland and placed his brother Louis on the throne. In 1811, the British conquered Java and appointed Thomas Stamford Raffles to serve as governor. He remained in office until 1816, at which time the newly created Kingdom of the Netherlands was awarded control of the VOC's former territories in Indonesia in return for relinquishing to Britain Dutch claims to territory in India and the Malay Peninsula. These arrangements were affirmed by Anglo-Dutch treaties in 1814 and 1824.

Besides tiny possessions on the Moluccas and Sulawesi, the VOC had successfully established direct rule only on Java, the future center of the new colony. There the Dutch continued developing the infrastructure, especially in road building and harbor development, but also strengthened its rule by military action. During the Java War (1825–1830), one of the bloodiest of all colonial wars, the Dutch defeated the opponents from the Javanese nobility and succeeded in placing the whole island under their control. On the so-called Outer Islands, colonization took much longer. On Sumatra the Dutch gained control in the 1860s except for Aceh, the Batak lands in the interior, and some small independent enclaves. Ultimately in Aceh colonial power was seized only in the early twentieth century

after the protracted Aceh War (1873–1904). In the eastern archipelago events were similar; starting from coastal possessions, colonial control gradually spread to the interior. But only systematic efforts during the first years of the twentieth century consolidated Dutch authority. The Toraja people on Sulawesi were brought under Dutch control in 1905–1906, Bali was conquered in several campaigns by 1908, and on Borneo western regions remained independent until 1916. Dutch expansion was slowed by ongoing resistance such as in the region of the Aceh War. Furthermore, the colonial administration had little interest in economically marginal regions such as Bali or outlying islands such as Irian Jaya.

The key difference between Dutch government rule and rule by the VOC was the official attempt to establish direct administrative control over the region. But Dutch colonial rule showed a dual structure since, to a certain extent, it continued the system of contracts between Dutch and indigenous authorities established by the VOC. As a result, the Dutch East Indies appeared as a composition of three types of colonial arrangements: territories directly administered by Dutch officials; regions administered by indigenous local committees, consisting of members of the regional nobility, under direct Dutch control (*inlandsche gemeentebestuur*); and states ruled by indigenous sovereigns with indirect “counselling” by Dutch residents (*zelfbestuurde landschappen*).

Dutch economic policy focused on growing cash crops for the world market. Coffee plantations on Java had existed since the early eighteenth century and on Sumatra since the late nineteenth century. Other colonial cash crops were sugar (since the seventeenth century on Java), tea (since 1825 on Java, expanding in western Java and northern Sumatra since 1870), rubber (since the 1880s on Sumatra), and palm oil (since the 1850s on Java and the 1910s on Sumatra). The plantation economy was dominated by Dutch and Chinese entrepreneurs, partly via joint stock companies. The indigenous private economy—mainly agriculture and small-scale handicraft—centered around the traditional village, which the colonial administration chose as the second main pillar of its economic policy

➤ SUICIDE ON BALI

The incorporation of Bali into the Dutch East Indies is one of the best examples of the difficulties of colonial consolidation and the cultural misunderstandings that accompanied it. For the United Dutch East India Company (VOC) and initially for the Dutch colonial administration, Bali was of minor interest. Since the 1830s the Dutch signed contracts with the traditional elites to establish indirect rule over Bali. But the Balinese did not regard these contracts as a transfer of sovereignty. Thus, permanent resistance against Dutch colonial and economic claims flared up and led to Dutch military expeditions. Their final campaign started in the early 1900s after Balinese raja had rejected compensation payments for the plundering of wrecked Chinese ships. In 1906 and 1908 two so-called *puputans* (basic meaning: “finishing”) occurred in the kingdoms of Badung and Klungkung; in a ritual procession the whole royal house-

hold and administration met soldiers and committed ritual suicide in which the majority were killed by Dutch bullets and others, being wounded, were killed by the Balinese themselves. From the Dutch perspective a *puputan* was an irrational rampage; from the Hinduistic view of the Balinese it was the honorable way to end a royal dynasty. The *puputan* enabled the royal family to preserve its spiritual integrity. The events caused a worldwide uproar. In Western understanding only explainable as a massacre, these incidents threw a disadvantageous light on colonial policies in Indonesia. Thus, the *ethiek politie*, or welfare interventionism, which was strengthened by the central Dutch government but in the beginning was avoided by several colonial officials in Asia, was fostered by new ethical arguments in the public debate on the Bali suicides.

—Jürgen Nagel

next to the plantations. Between 1830 and 1870 the cultivation system (*kultuur stelsel*) on Java forced rural villages to produce cash crops (mainly coffee, sugarcane, and tea) through a system of land taxes, regulations, and monopolization. In the Netherlands, perceived abuses of the culture system led to increased economic and humanitarian criticism of the monopoly of the Dutch Trading Company (Nederlandse Handel-Maatschappij, NHM), of the company's hindrance to free entrepreneurship, and of its use of force and coercion.

In 1870 the Dutch government abolished the cultivation system. Nevertheless, in some regions forced cultivation remained until 1890, and the state monopoly in coffee survived until 1915. After 1915 the Dutch administration followed a policy of *laissez-faire* that set the stage for the beginnings of the epoch of plantation agriculture. Increasing public debates on colonial politics and exploitation led to the implementation of the new “ethical policy,” a policy of so-called welfare interventionism (*ethiek politie*) in 1901. This Dutch version of a civilizing mission relocated the focus of colonial policy to a more morally legitimized treatment of indigenous societies and led to significant improvements in

infrastructure, transportation, and communication facilities accompanied by some efforts in education.

Ironically, such welfare interventionism engendered new forms of resistance and the beginnings of Indonesian nationalism. Traditional indigenous antagonists of colonialism had been defeated in the nineteenth century during the colonial wars. Now nationalist, socialist, and Islamic groups benefited from growing tolerance, political participation, and education. Dutch efforts to suppress the varying anticolonial parties finally strengthened the radical nationalists led by Sukarno and Mohammad Hatta. In 1942 the Japanese invasion factually terminated Dutch colonialism. Japan's capitulation enabled Sukarno in 1945 to declare the independent Republic of Indonesia. The Dutch attempted but failed to reestablish colonial rule during the Indonesian War of Independence (1946–1949).

The End of Spanish Rule in the Philippines

Filipino opposition to Spain's control of the Philippines grew steadily from the eighteenth century onward. Following the loss of its Latin American territories in the early 1800s, Spain's administrative presence became increasingly intrusive and onerous for Filipinos. Forms of opposition varied, however, and even as emerging groups of middle-class Filipinos demanded legal and economic reforms, sporadic peasant protests occurred. Initially, leading opponents of Spanish rule rarely supported independence, but by the late nineteenth century it had become clear that Spain was no longer able to contain the recurrent violence and demands for change.

The vulnerability of Spanish control had been demonstrated in September 1762 when a hostile British naval squadron appeared in Manila Bay with over 1,000 troops onboard. The unprepared defending troops from Spain (and the viceroyalty of New Spain) surrendered, having been unaware of Spain's involvement in the Seven Years' War. The British withdrew in 1764, but sporadic Filipino resistance to Spanish rule continued in the Ilocos, Pangasinan, and Bohol regions. Filipino grievances in these areas ranged from the imposition of tribute payments to activities of Roman Catholic religious orders and the Church's attempts at religious control.

The British occupation had revealed the need for increased revenues to pay for the defense of the Philippines. Spain's economic interests had been largely focused on Manila, which served as an entrepôt for luxury Asian goods and Mexican silver. In accordance with Spain's mercantilist policies, the goods were sent annually

by galleon from Manila to Acapulco in New Spain. In return, the Viceroyalty of New Spain sent galleons laden with silver to Manila each year to sustain the Philippine treasury. Following the occupation, however, local exports were steadily increased to improve the isolated colony's capacity for defense. Tobacco was exported successfully along with sugar, indigo, and hemp. Accompanied by increasing numbers of Chinese merchants, this fueled an expanding cash economy and an emergent Filipino middle class.

Mexican independence in 1821 signaled a new period of economic and administrative change in the Philippines, as administrators sought to compensate for the loss of New Spain's support. From the 1840s, policies encouraged the construction of new roads, canals, and harbors to improve the islands' commercial potential and economic viability. Concerned by the Mexican precedent, Spanish administrators attempted to exclude criollos from positions of authority. New regulations excluded them from military office, prompting the mutiny led in 1823 by the army officer Andres Novales. The same year, Luis Rodríguez Varela and José Ortega were among a number of intellectuals exiled to Spain for having written pamphlets and novels that protested increased discrimination. Varela's pamphlets urged loyalty to the king but demanded that criollos be given the same rights as Iberian Spaniards.

Demands for reforms to education and the law became increasingly widespread among both criollos and Filipinos. From 1863, a series of liberal reforms sought to emulate the wave of liberalism then current in Spain. The rise of Spanish liberalism encouraged a belief that similar changes were possible in the Philippines. New policies sought to improve standards in education and to correct the Church's progressive encroachment of state prerogatives. Despite rising expectations, it became clear that conservative administrators and clergymen would frustrate any sustained effort at liberal reform.

The privileged and influential position of Spanish friars had become increasingly contentious during the nineteenth century. Indigenous hostility to Spanish clergy was long-standing, as religious orders had appropriated indigenous peoples' lands. Filipinos increasingly lived in

municipalities, however, where friars' influence on daily life was wide ranging and extended from schools to public order. Moreover, friars vigorously defended their autonomy from local bishops' supervision. Middle-class Filipinos were particularly concerned by friars' reactionary sentiments and attempts to deny Filipinos the education necessary for empowerment and change. Apolinario de la Cruz (1815–1841), a Catholic priest who had founded a religious order for Filipinos called the Confraternity of St. Joseph after having been denied membership in the Dominican order by Spaniards, had inspired the Confradia Revolt in 1841 that protested the effects of the Spaniards' religious control. Yet colonial administrators generally supported the friars, fearful that an empowered indigenous priesthood might lead to further revolts. One attempt to allocate additional parishes to Spanish friars prompted Father Pedro Peláez, the Filipino archbishop of Manila, to galvanize local clergy's resistance in 1861. Despite his failure, Filipino clergy continued to play a central role in maintaining opposition to Spaniards and tempered the more anticlerical elements of growing dissent.

The period of liberal reforms and public debate ended in 1872 with the repression that followed the Cavite Mutiny. Initially led by criollo officers at the Cavite naval base in January 1872, a wage dispute escalated as Filipino workers and soldiers hoped that other garrisons would join their mutiny. Fearful of further rebellions, Spanish authorities instigated a widespread repression and a number of exemplary executions. Instead of pacification, the Spanish response unified Filipino and criollo anger at racial prejudice and social injustice. Public opinion expressed a sense of enagement at the decision to execute three prominent liberal Filipino priests: José Burgos, Mariano Gómez, and Jacinto Zamora. In an effort to avoid the repression and to access better education, increasing numbers of wealthy Filipinos sent their children to be educated in Europe. From Europe's major cities, men such as the novelist José Rizal (1861–1896) instigated the literary movement known as the Propaganda Movement and demanded further legal and administrative reform.

By the early 1890s it was becoming obvious that Spain would not instigate the reforms that

THE PROPAGANDA MOVEMENT

The Propaganda Movement (1880–1895) exercised a formative influence on the emerging expression of Filipino nationalism. The movement aimed to secure for Filipinos and criollos the same rights that Spaniards possessed in the peninsula, such as representation in parliament. Yet the Propagandists instead fueled the rise of a self-conscious Philippine identity. From cities throughout Europe, they circumvented censorship and engaged in literary publications that ranged from books to pamphlets and newspaper articles.

The most famous Propagandist, José Rizal, occupies a seminal position in Philippine nationalism. Rizal demanded administrative and religious reforms, which would strengthen the Philippines' relationship with Spain. His novels, *Noli Me Tangere* and *El Filibusterismo*, extolled the history and characteristics of the Philippine nation and carefully distanced it from the corrupt habits of Spanish friars. He also liaised with European intellectuals, such as his close friend Ferdinand Blumentritt, and wrote numerous articles for the Propagandists' newspaper *La Solidaridad*.

Spanish authorities within the Philippines considered Rizal's works highly seditious, and he was obliged to live in Europe and Hong Kong for much of his life. Although literacy rates among the Philippine population were generally low, Rizal rapidly acquired a heroic status that was used by others in the Katipunan to justify overt military resistance to Spanish rule. Aware of his vulnerability after his return to the Philippines in 1892, Rizal sought to serve in the Spanish army in Cuba. He was recalled, however, and executed for fomenting insurrection in December 1896.

—Robert Mason

many Filipinos demanded. In response, the Katipunan secret society was founded in 1892 in order to expel the Spanish. By 1895 the Katipunan was led by Andrés Bonifacio and was organized according to a network of secretive local chapters. As an organization it urged Filipinos to cooperate and support one another, emphasizing a single united nation. Alarmed at its growth, in 1896 the Spanish governor ordered troops to quash the Katipunan. In response and after extensive debate, Katipunan members resolved to begin

the long-planned armed revolution. The ensuing “Cry of Balintawak,” referring to the shouts that accompanied the tearing up of Spanish-required residency/tax certificates, has subsequently been taken to mark the beginning of the violent revolution to oust the Spanish from the Philippines.

Philippine Revolution, 1896–1898

The Philippine Revolution was a struggle for independence by a group of Filipino revolutionaries spearheaded by the Katipunan, which launched an uprising against the Spanish colonial government in 1896 that rapidly spread throughout the archipelago. The revolution was the culmination of Filipino nationalist aspirations during the last quarter of the nineteenth century originating from the Propaganda Movement to the founding of the revolutionary Katipunan. Despite failing to attain independence, the revolution heightened the nationalist consciousness that was witnessed during the Philippine War of Independence (1899–1902), when Filipinos fought the newly installed U.S. colonial regime.

Anti-Spanish revolts prior to the mid-nineteenth century were characterized by parochial dissatisfaction toward harsh or unjust treatment at the hands of local Spanish officials or friars. The Muslim Moros had long waged a protracted struggle of resisting Spanish control ever since the inception of Spanish rule over the rest of the archipelago from the late sixteenth century. During the nineteenth century two events had a deep impact on Filipino attitudes toward the Spanish colonial regime. The tragedy of Tayabas in 1840 reflected the oppressive attitude of the Spanish authorities, who were hand in

glove with the friars. Racial discrimination was the rule within the clergy: despite their education, Filipino priests were allocated only subordinate positions in the church hierarchy. When Father Apolinario de la Cruz (1814/1815–1841) sought permission to start the confraternity of San José in Tayabas, he was denied because the Dominicans felt threatened. Nonetheless, Cruz went ahead to found his order, with followers coming from Tayabas, Laguna, and Batangas. In 1841 during a meeting at Tayabas, Spanish troops killed many adherents, including Cruz. The following year, Filipino soldiers in Tayabas staged a mutiny; they were ruthlessly suppressed.

Then in 1872, Filipino troops in Cavite mutinied; the mutiny was swiftly suppressed. The Spanish friars, especially the Dominicans, feeling that Filipino intellectuals and clergy had criticized them, convinced the Spanish colonial government to take severe measures, including the arrest, imprisonment, or exile of those intellectuals. Still dissatisfied, the Dominicans demanded the execution of the Filipino priests Jose Burgos, Mariano Gomez, and Jacinto Zamora; the three were executed by garroting.

The Tayabas and Cavite episodes stirred the general population to indignation but also exhibited their impotence at taking further action, owing to the repressive Spanish regime. Meanwhile, a group of Filipino students—the *ilustrados*—from well-to-do families living and studying in Spain began what became known as the Propaganda Movement, which sought to convince the Spanish home government to institute reforms in the colonial administration of the Philippines. Through the columns of the newsletter *La Solidaridad*, these reformers proposed moderate demands such as freedom of speech, equality before the law, Filipino representation in the Spanish Cortes, Filipinization of the clergy, and assimilation. The influence of the Propaganda Movement was limited; some Spanish, especially fellow intellectuals, sympathized with the Propaganda Movement, but the Spanish government showed lack of interest. Not allowed to air their reformist views in the Spanish language, the reformers needed support from the majority of their untutored countrymen at home. However, it was not the intention of the

reformers to rouse the peasant masses to revolt; their objective was to move the Spanish government to take measures to improve the colonial system.

José Rizal (1861–1896), who came from a wealthy family, was an active advocate of reform. His novel *Noli Me Tangere* (1887) and its sequel *El Filibusterismo* (1891) sought to expose the evils of the colonial regime. Rizal was a reformer, not a revolutionary, despite the strong language and damaging criticism he leveled at the Spanish colonial government in his second novel. In *Noli*, his protagonist agitated for reforms utilizing peaceful means. But in *Fili*, the same protagonist was forced to abandon peaceful measures owing to their futility and turned to radical action, including violence, to achieve his ends. Rizal returned to the Philippines in 1892. He discussed his plans for reform with Eulogio Despujol, governor during 1891–1893, and Despujol showed interest. In July Rizal formed La Liga Filipina, an organization that strove for the betterment of the Filipinos. But on July 6 Rizal was arrested and banished to Dapitan, Mindanao.

Rizal's writings, including his two novels, were banned in the Philippines but enjoyed a wide readership among intellectuals. Andres Bonifacio (1863–1897), born of plebeian background, was greatly influenced by Rizal and his works, in particular *El Filibusterismo*, in which force and radical solutions are advocated. Bonifacio and others revived La Liga Filipina. Its objectives were to explore all peaceful ways and legal means to convince the Spanish colonial regime to introduce reforms. When the colonial government did not pay heed to their appeals, La Liga Filipina again disbanded. Two groups emerged: the *Compromisarios* continued to advocate reforms through the support of La Solidaridad, and those led by Bonifacio formed the Katipunan ng mga Anak ng Bayan (Society of the Sons of the People).

Witnessing the futility of peaceful means and the fruitless emphasis on reform, the Katipunan raised the standard of armed revolt. Through its underground newspaper *Kalayaan* (Freedom), edited by Emilio Jacinto (1857–1899), the Katipunan's cause was expressed: expulsion of all Spaniards from the Philippines and complete independence. An armed revolution was called for.

Only the peasants heeded Bonifacio's and the Katipunan's call for revolution. But support from the moneyed class was lacking; consequently funds were low, retarding efforts to procure arms. Therefore, an armed revolution in 1896 was premature. In July 1896 when told of the Katipunan's plans for a revolution, Rizal decried its limited resources and its timing and predicted its inevitable failure.

But when the Katipunan's revolutionary plans were betrayed to the Spanish authorities and thousands were arrested and executed, Bonifacio launched the Philippine Revolution on August 30, 1896, with the Battle of San Juan Del Monte as the first clash of arms between the Katipunan-led revolutionaries and the Spanish colonial army. A month later at Binakayan, Cavite, the revolutionaries tasted their first significant victory.

When the revolution broke out, Rizal was on his way via Spain to Cuba, where he intended to volunteer his medical services. The island colony was in the midst of the Cuban War of Independence (1895–1898), led by the writer and patriot José Martí (1853–1895).

Rizal was arrested upon his arrival in Spain and shipped back to Manila. Tried, convicted, and then executed on December 30, 1896, Rizal was transformed into a martyr for the nationalist struggle.

Meanwhile, for want of arms and strong leadership the revolutionaries faced repeated setbacks on the battlefield. What is more, within the Katipunan dissension came to the fore. Despite an agreement reached on March 12, 1897, members were split between followers of Bonifacio and those of Emilio Aguinaldo (1869–1964), a proven military strategist. In May, Aguinaldo had Bonifacio arrested and executed.

The Pact of Biaknabato (December 1897) witnessed a brief cease-fire. In return for Aguinaldo's exile, the Spanish side agreed to grant amnesty to all Filipinos who gave up their arms and indemnify them for war damages. The Filipinos, however, were dissatisfied, as fundamental demands were not addressed: equality, representation in the Spanish Cortes, secularization, and the granting of human rights and civil freedoms. Bad faith on both sides led to renewed

hostilities. Francisco Makabulos, a revolutionary leader, achieved some success in central Luzon.

The Spanish-American War broke out in 1898. At the Battle of Manila Bay (May 1898), the U.S. Asiatic Squadron under Commodore George Dewey (1837–1917) destroyed the Spanish fleet. A U.S.-Philippine alliance was formed to defeat the common foe, Spain. On June 12, 1898, Aguinaldo declared the independence of the Philippines. By the end of June, Aguinaldo and Makabulos had secured most parts of Luzon and had laid siege to Manila. Major General Wesley E. Merritt attacked and seized Manila on August 13, 1898. Fearing a massacre, Dewey persuaded Aguinaldo and the revolutionaries not to enter Manila when the Americans launched the assault. Diego de los Rios, Spanish governor in 1898, surrendered to Dewey. On December 10, 1898, the Spanish-American Treaty of Paris witnessed Spain's ceding the sovereignty of the Philippines to the United States in exchange for US\$20 million. Double-crossed and cheated, the Filipino revolutionaries turned on their former allies in February 1899, starting the Philippine War of Independence (1899–1902).

The Filipino revolutionary government did not recognize the U.S. acquisition of the Philippines. Instead, on January 20, 1899, Aguinaldo became the president (1899–1901) of the Philippine Republic. A Congress of Representatives was convened in Malolos (October–November 1899) whereby a constitution drafted by Apolinario Mabini (1864–1903) was adopted.

Reflecting on the revolution, including Aguinaldo's resistance to the U.S. takeover, Schumacher noted: "The Revolution of 1896–1902 was indeed a nationalist revolution in which all classes of society participated. But beneath that common surge of national feeling, a complexity of motives and forces were at work, which no monolithic framework can adequately explain."

Philippine War of Independence, 1899–1902

The Philippine War of Independence started on February 4, 1899, when U.S. soldiers in Manila fired at Filipino troops surrounding the city. When General Emilio Aguinaldo (1869–1964) noticed that the Americans intended to attack his troops, he declared war on the United States. The war that erupted was viewed differently by the two warring parties. The Philippine side considered the conflict a "war of independence" because they had proclaimed an independent republic and saw the Americans as imperialists, bent on occupying their country. The United States did not recognize the Philippine Republic and considered itself the legitimate sovereign of the islands, after Spain had transferred the colony to the United States. Consequently, the United States spoke of the war as the Philippine Insurrection and saw the Filipino freedom fighters as rebels.

The Spanish-American War (1898) concluded with the Treaty of Paris on December 10, 1898. Spain had agreed to cede Cuba, the Philippines, Guam, and Puerto Rico to the United States, and the United States had promised

to pay the sum of \$20 million to Spain for the transfer of the Philippines. By that time it had become clear that the U.S. government was bent on acquiring the Philippines as a colony. On December 21 U.S. president William McKinley delivered a proclamation claiming jurisdiction over the Philippines and announcing the intention to rule the islands in accordance with the principle of “benevolent assimilation.”

This went against the wishes of the Filipino revolutionaries, who had proclaimed an independent Philippine Republic, with the center of government at the town of Malolos, and had adopted a constitution for the new state. On January 21, 1899, Aguinaldo proclaimed the constitution as the supreme law of the republic, and the next day he was formally inaugurated as president of the new republic. What would later be called the First Republic or the Malolos Republic was now a fact.

When war broke out, the Americans had gathered a sizable army in the islands and were prepared to attack the Filipino troops and conquer the islands. General Aguinaldo had prepared his forces for conventional warfare and had put up lines of defense to block the advancing U.S. troops. However, time and again the Filipino troops were defeated; they had to abandon their positions and retreat. The Americans advanced to the north because they thought that if they could conquer the town of Malolos, the Filipino revolutionaries would give up their resistance. Malolos fell in May, and Aguinaldo's troops continued their retreat to the north. As a result of the retreat, the Filipino army disintegrated. In November, by which time little was left of the Filipino army, Aguinaldo and his generals decided to shift to guerrilla warfare. From then on, small Filipino units carried out attacks against U.S. troops.

The U.S. Army was at a level of 40,000 men in the first year and reached 70,000 in 1900. Initially the soldiers were equipped with outdated rifles, but later they acquired newer ones. The Filipino side probably counted between 80,000 and 100,000 men in regular units, armed with standard European rifles, but they were short of ammunition. The Americans were better trained than the Filipinos. As historian Glenn Anthony May wrote in 1987, difference in weapons,

however, was not the decisive reason why the United States had the upper hand. The main reasons why the Americans won the war were that they were better trained and that General Aguinaldo stuck to the principle of conventional warfare instead of using guerrilla tactics at an early stage of the war. Moreover, the Philippine population was lukewarm in its support for Aguinaldo and his army. In addition, ethnic conflicts and personal rivalry weakened the Philippine military effort. In June 1899 General Luna, a competent military leader, was assassinated, probably with the knowledge of General Aguinaldo, who feared him as a rival.

Fighting continued throughout 1900. In early 1901 many Filipino commanders had been killed or captured or had surrendered. South of Manila in the province of Batangas, U.S. forces conducted a harsh campaign against Aguinaldo's men, causing large numbers of civilian casualties.

General Aguinaldo had withdrawn to the northeast coast with a small group of Filipino soldiers. In a surprise attack by the Americans, assisted by Filipino auxiliary troops, General Aguinaldo was captured on March 23, 1901, in Palanan, Isabela Province. The Americans brought him to Manila. In April, Aguinaldo issued a statement acknowledging and accepting the sovereignty of the U.S. government over the Philippines and calling upon his fellow countrymen to lay down their weapons. After having taken the oath of allegiance to the U.S. government, Aguinaldo returned to private life. Three Filipino generals continued fighting in the provinces to the south of Manila, but they surrendered in the early part of 1902. On July 4, 1902, the U.S. government declared that the “Philippine Insurrection” was over and that a state of peace existed in the islands. The United States proclaimed a general amnesty for all those who had fought against the Americans. In 1901 the Americans had replaced the military government with a civilian administration. Many Filipinos from the educated stratum and the elite had offered their services to the U.S. administration in the Philippines.

However, the war was not yet over. A number of Filipino commanders along with their soldiers refused to take the oath of allegiance and continued fighting against the U.S. occupation.

The U.S. government now considered them criminals who could no longer count on amnesty but could receive the death sentence if captured. In several places cultist sects with politico-religious beliefs rebelled against the Americans. The U.S. government created the Constabulary, a military police force, to deal with these law-and-order problems. By 1906 the Philippines had been brought under U.S. control except for the Muslim provinces in the south, which took another decade to pacify.

European Imperialism in the Pacific

Although the Spanish, Portuguese, and Dutch had been exploring and conquering parts of the Pacific since the sixteenth century, it was only between 1760 and 1914 that the whole of the Pacific region, with the exception of Japan, came under the domination of foreign powers. By the outbreak of World War I, Great Britain, France, Germany, the Netherlands, and the United States controlled vast numbers of island territories and dramatically altered the demographic, political, and economic landscape of the indigenous inhabitants.

Nineteenth-century European expansion occurred in the Pacific for several reasons. Eighteenth-century scientific and cartographical missions gave way to the economic interests pursued by merchants and the inroads made by missionary societies that were very active in the

Pacific. Securing bases for whalers and sealers and rapidly expanding navies also gave impetus to expansion. Especially in the late nineteenth century, national power rivalries and social Darwinist thinking also played a major role in inspiring imperialism in this and other regions.

The British, who had achieved worldwide maritime dominance by the mid-eighteenth century, were nevertheless slow to expand into the Pacific compared to their Spanish and Dutch rivals. However, they eventually exerted imperial control from Tasmania and New Zealand in the south to the Gilbert Island chain in the east. Despite the knowledge of the area that Captain James Cook's voyages secured, British extension of imperial power did not begin in earnest until the latter decades of the eighteenth century. In 1788 a penal colony for British convicts, many of them Irish, was established in Australia in New South Wales. Another penal colony was established on the island of Tasmania in 1803. By 1829 the whole of the Australian continent had been claimed by Britain. Most British migration to the Pacific flowed throughout the nineteenth century to Australia and New Zealand.

While most British efforts were directed at trade and the subjugation and settlement of Australia and New Zealand, France was also acquiring colonial possessions in the mid-nineteenth century. In 1842, after decades of competing with English interests on Tahiti, the French admiral Abel Aubert Du Petit-Thouars (1793–1864) declared the island's annexation to France, a move formalized by the Anglo-French Treaty in 1847. Du Petit Thouars also established French control over the Marquesas and Society Islands, as well as the small islands of Wallis and Fortuna, where French missionaries had already been active for several years. In 1843 French missionaries, with Du Petit's aid, claimed the large island of New Caledonia, a move formalized in 1853 by Napoleon III. Following the British model, thousands of convicts were sent to penal colonies on the island. While some would eventually be granted small parcels of land, thousands would also die in the harsh environment of New Caledonia. Although subsequently the French did not substantially expand their Pacific island holdings except for the acquisition of New Hebrides, they did solidify their holdings, making formal annexations

➤ MUTINY ON THE *BOUNTY* AND PITCAIRN ISLAND

In 1789, Captain William Bligh, an officer in the British Royal Navy, suffered the famous mutiny at the hands of his crew after a difficult voyage to Tahiti. The mutineers left him and 18 loyal crew members adrift in a tiny launch in the open sea. Through amazing feats of navigation and endurance, Bligh and the surviving crew eventually arrived at the Dutch island of Timor after stopping at Tofua, an island in the Tongan grouping, where the islanders attacked and killed one crew member. The mutineers returned to Tahiti, but certain that they would be punished by death and that the British Royal Admiralty would hunt them down,

they settled with their Tahitian companions on remote Pitcairn Island in 1790. Internal strife, sickness, and murder took their toll on the inhabitants. By 1808, when the island was found by an American vessel, only one of the original male inhabitants remained, with dozens of women and children. The island became formally incorporated into the British Empire in 1838. The population grew so large that it had to be moved to the larger Norfolk Island closer to New Zealand in 1856, though a portion of the refugees returned to reestablish their lives on Pitcairn Island.

—Gerrit Dirkmaat

of islands that had previously been nominally governed as protectorates, a situation that implied at least some level of local autonomy.

The British, enabled by their naval superiority, continued to gain island possessions throughout the nineteenth and early twentieth centuries. Although trading contacts with various islands were maintained, full British domination over many of them did not occur until the last quarter of the nineteenth century, with the British dominating Fiji (1874), northwestern Borneo (1888), the Phoenix Islands (1889), the Gilbert Islands (1892), the Ellice Islands (1892), and the Solomon Islands (1893). Although Britain had long dominated aspects of Tongan society, a treaty guaranteeing that island's local autonomy and the suzerainty of the British over foreign affairs was reached in 1900. New Hebrides, or Vanuatu, came under joint British and French control in 1887, which was formalized by treaty in 1906. In addition to formal British imperialism in Oceania, British colonies in the region themselves exercised imperial authority, with Australia dominating the southeastern portion of New Guinea (1883) and New Zealand exercising control over Rarotonga and the Cook Islands.

Germany was the last of the European powers to colonize the Pacific. German merchants and missionaries pressed the German government to annex northeastern New Guinea, or Kaiser-Wilhelmsland, in 1884. Germany also

announced protectorates over New Britain (New Pomerania), New Ireland (New Mecklenburg), Bougainville, several islands in the Northern Solomons and the Marshall Islands, and Nauru. Otto Von Bismarck orchestrated the purchase of the Caroline Islands and the Marinas Islands from Spain in 1899 after the latter sought to divest itself of the scattered islands following its losses in the Spanish-American War of the Philippines and Guam. German, American, and British interests in Samoa nearly led to conflict, but Germany was granted the western portion of the island group by treaty in 1899.

While the “white” colonies of Australia and New Zealand would be granted self-government within the British Commonwealth shortly after the turn of the century, most of the smaller Pacific island possessions remained under European control until well into the twentieth century. Following the German defeat in World War I, its Pacific holdings were divided among the victors, with Japan, Britain, and New Zealand all making substantial gains.

While initial economic interests centered mainly on establishing trading contacts with the various islands and with sealing and whaling stations and obtaining the aromatic and highly prized sandalwood, greater levels of exploitation soon followed. Fiji was converted into a plantation society with massive sugar, coconut, and even short-lived cotton plantations. Some islands were valued for their mineral wealth, such as

the phosphate deposits on Nauru. Copra production gained prominence in many European colonies in the Pacific, as the highly prized coconut oil gained markets as a substitute for whale oil.

European contact had devastating effects on the native inhabitants of the Pacific through the introduction of European diseases and confiscation of native lands and resources. For example, the British supplied arms to natives, such as the Maoris in New Zealand, who then conducted more brutal internal wars fought between various tribal factions. To facilitate plantation labor, the British, French, and German colonizers imported thousands of contract laborers to various islands. In other island groupings, such as New Hebrides, the indigenous workers were often compelled to become contract workers themselves, with thousands going to Australia. Both of these practices deeply disturbed the populations and cultures of the Pacific islands, with lasting impacts. Some island groups, like the

Marquesas, were almost completely depopulated by disease and forced deportations, while others such as Fiji found that imported contract laborers from India soon made up more than 30 percent of the island's population. Few efforts were made by the European powers to raise the standard of living of their colonial subjects in any of the Pacific colonies.

Economics and Trade

In 1750 the world economy was dominated by three large regions, Europe, India and China, which were more or less equal in terms of economic development, level of technology, and the standard of living and life expectancy of their populations. Each of these regions produced approximately 23 percent of the world's gross domestic product, and together the three regions produced just short of eighty percent of the world's manufactured goods, with China leading the way with 33 percent and India and Europe each producing 23 percent. These percentages had not appreciably changed by 1800, but by 1900, a spectacular transformation had occurred, resulting in an unprecedented situation in which one region, Europe, along with its offshoot the United States, had achieved dominance of the world's economy. In 1900 Europe produced 60 percent of the world's manufactured goods, and the United States, 20 percent, with China's share dropping to 7 percent and India's to just under 2 percent. An immense economic gap between the West and the rest of the world had opened up, contributing to equally imposing gaps in many other areas. Around 1900 the people of Europe, the United States and colonies of European settlement such as Canada, Australia, and New Zealand were richer, better fed, better educated, lived longer, and received better medical care than Asians, Africans, and most people living in Latin America. The West's economic ascendancy was directly linked to its equally impressive political power: the Europeans' take-over of Africa, India, Southeast Asia, and the Pacific Islands was motivated by a perceived need to secure markets and access to raw materials for their manufactured goods, while the conquest and maintenance of overseas empires would have been impossible without the weapons and warships manufactured in Western factories and the financial resources generated by the expanding Western economies.

What explains the West's meteoric rise to world economic dominance between 1800 and 1900? The simple answer is that Europe and the United States experienced what has come to be known as an industrial revolution, or rather several industrial revolutions, and no other part of the world did. Although there is some debate about the origins of the term "industrial revolution," its first use is generally credited to the English economic historian and social reformer Arnold Toynbee, who lived from 1853 to 1883, and is not to be confused with the better known Arnold Toynbee (1889–1975) who wrote the popular twelve-volume history of civilization, *The Study of History*. In early 1882 the lesser-known Toynbee delivered a series of lectures titled "The Industrial Revolution in England," which were published posthumously in 1884. This revolution, he argued, was a unique English phenomenon,

occurring between 1760 and 1830; its “essence” was the “substitution of competition for the medieval regulations which had previously controlled the production and distribution of wealth.” Although few historians accept the details of his arguments (coming as they did before industrialization had fully taken hold in continental Europe, the United States, and Japan), few quibble with his basic point: industrialization was a profound turning point in human affairs, comparable in importance to the great political revolutions of the eighteenth and nineteenth centuries and perhaps as important as the discovery of agriculture thousands of years earlier.

First and foremost, industrialization is characterized by a momentous increase in human productivity, brought about by the use of machines, the introduction of new sources of energy, including coal, petroleum, and electricity, and the increased scale of enterprise in most industries, with factories employing hundreds or thousands of unskilled and semiskilled workers. Having begun in England in the 1760s, industrialization remained largely a British phenomenon until

the early 1800s, when it began to take root in the Austrian Netherlands (after 1830, Belgium) and later spread to France, Germany, and the United States. Japan and Russia launched successful industrialization campaigns in the 1880s and 1890s, but other government-sponsored programs of economic modernization such as those of the Egyptian ruler Muhammad Ali (r. 1805–1841) and the Chinese advocates of “self-strengthening” in the late 1800s were largely failures. In the first half of the twentieth century the spread of industrialized economies slowed in the

Japan and Russia launched successful industrialization campaigns in the 1880s and 1890s, but other government-sponsored programs of economic modernization such as those of the Egyptian ruler Muhammad Ali (r. 1805–1841) and the Chinese advocates of “self-strengthening” in the late 1800s were failures.

face of war and the Great Depression of the 1930s, but in the century’s closing decades, Taiwan, South Korea, Brazil, India, and China all emerged as important industrial powers.

Throughout its history, industrialization has been driven forward by continuous technological innovation. Britain’s industrialization was set in motion by technological developments in three areas: a series of devices and machines that transformed the age-old tasks of spinning and weaving; the development of the first commercially viable steam engines that supplemented and then largely replaced windmills and water mills as inanimate sources of power; and the discovery of a new method of smelting iron using coke (essentially baked coal), which freed iron makers from their dependence on charcoal. Beginning in the 1830s, advances in machine making and metallurgy, combined with refinements in the design and manufacture of steam engines, set off a boom in railroad construction that increased demand for iron and coal, created new industries and factories to produce locomotives and rolling stock, generated new jobs in carriage making, upholstery, and glass production, and spurred major construction projects involving the laying of rails and the building of tunnels, bridges, and stations.

From the 1860s to the onset of World War I, industry and many aspects of everyday life were transformed by a profusion of technological developments that make these five decades the most innovative and inventive in history to that point. Following the invention of the electric telegraph in the 1830s, the telephone was invented in the 1870s and the radio in 1899. New machines were developed for making paper, rope, guns, bicycles, leather goods, tin cans, farm equipment, sewing machines, tools, typewriters, and countless other machines and products. New methods of steel production reduced the price of steel by half and caused machine makers, railway men, shipbuilders, and builders of bridges and skyscrapers to switch from iron to steel. Whole new industries were developed as a result of discoveries in chemistry and the science of electricity. By the 1890s, houses were wired so homeowners could take advantage of Thomas Edison's incandescent light bulb, which began to be marketed in 1879. In factories, belts, pulleys, drive shafts, and gears needed to transfer energy from a waterwheel or steam engine were replaced by wires connected to electric motors that could drive machines wherever they were needed on the factory floor. New industrial processes such as the production of aluminum from bauxite depended on electrical power, as did the tramways and subway cars installed in many of the Western world's major cities.

The potential of petroleum as an energy source was hinted at by the invention of a four-stroke gasoline-fired internal combustion engine in the 1880s by two Germans, Gottfried Daimler and Karl Benz, and the development in 1897 of a compression-ignited engine that burned heavy liquid fuel by another German, Rudolf Diesel. The development of the first gas-powered automobiles in the late 1880s, the use of a gas-powered engine for the world's first heavier-than-air flight in 1903 at Kitty Hawk, North Carolina, the production of the first Model-T Ford in Dearborn, Michigan in 1908, and the decision of the British Royal Navy in 1912 to convert from coal to oil all were signs that the twentieth century would be an age of petroleum rather than steam and coal.

An endless stream of statistics could be cited to show how industrialization increased human productivity from the 1760s to the early twentieth century. To cite several examples: in Great Britain, between 1750 and 1900 cotton production increased more than 700 times, coal production by more than 50 times, and pig iron by more than 300 times. In that same period, steam engine usage in Great Britain increased by nearly 2,000-fold, producing 10 million horsepower in 1900 compared to 5,000 in 1750. In Germany, whose industrial take-off began in the 1870s, steel production increased from 240,000 tons in 1879 to 20.5 million tons in 1913. Growth in steel production was even more spectacular in the United States, which produced 40,000 tons in 1870 and 34.4 million tons in 1913, making it the world's leading steel producer.

Manufacturing was not the only aspect of the world economy that was transformed in the late eighteenth and nineteenth centuries. In the world's industrialized regions, the relative economic role of agriculture declined, as did the percentage of the population devoted to agricultural pursuits. In advanced industrial societies such as England and Belgium, by 1900 a majority of the population lived in cities. Nevertheless,

during this period there was an upsurge in agricultural productivity as a result of new methods of crop rotation, the introduction of farm machinery, increased use of fertilizer, changes in land tenure, increased irrigation, and above all, the opening of new lands to farming and stock-raising in the Americas, Australia, parts of Africa, and New Zealand. In the United States alone, wheat production increased from 175 million bushels in 1866 to 655 million bushels in 1900. Such gains in agricultural productivity were the main reason for the increase in the world's population from approximately 900 million in 1800 to 1.6 billion a century later.

World trade also expanded. For the world as a whole the volume of trade per capita increased twenty-five-fold between 1800 and 1913, with the most rapid growth occurring between the early 1840s and the early 1870s, when the total amount of trade increased on average by 6 percent a year, five times as fast as population growth and three times as fast as the increase of production. Many factors contributed to this impressive increase in world trade, including overall population growth, the demands of industrialized nations for food and raw materials, the worldwide demand for European manufactured goods, the general lowering of tariffs, the near universal adherence to the gold standard, and the decrease in the cost of land and water transportation as a result

of improvements in sailing ships, the development of the steamship, and above all the building of railroads.

For much of Latin America, the late nineteenth and early twentieth centuries brought little industrialization but nonetheless were a golden age of economic expansion based on the export of rubber, tobacco, sugar, guano, hides, beef, wheat and a host of other basic commodities.

The industrialized nations of the West were not the only beneficiaries from these economic changes. For much of Latin America, the late nineteenth and early twentieth centuries brought little industrialization but nonetheless were a golden age of economic expansion based on the export of rubber, tobacco, sugar, guano, hides, beef, wheat and a host of other basic commodities. West African farmers

profited from the sale of peanuts, coffee, and cacao on the global market, as did small numbers of Indian and Egyptian cotton growers and Indonesian plantation owners who specialized in sugar production.

On the whole, however, one is struck by the one-sidedness of global economic relationships in this new industrial age. In colonial Africa and Asia, European businessmen, with the backing of colonial administrators, took over diamond mines, gold fields, and vast tracts of prime agricultural land, and encouraged (or forced) farmers to shift from growing food crops to products such as sugar and cotton that could be sold in the world market. In China, the Middle East, and Latin America, Western businessmen monopolized railroad-building, major construction projects, the banking and insurance industries, and the manufacture and marketing of many popular consumer products. Great industrial powers such as India were “deindustrialized” after England flooded the Indian market with inexpensive cotton goods manufactured in the

industrial centers of northern England. In the new global economy, India, like so much of Africa, Latin America, and the rest of Asia was reduced to being a producer of raw materials and a market for Western manufactured goods.

What explains these stunning economic transformations? How did a world in which Europe was an important but not dominant player become a world in which Europe's economic ascendancy radiated to every corner of the globe? Why did industrialization take root in Europe but not in Asia? Why did an industrial revolution first occur in Great Britain, and why did it begin in the eighteenth century? Such questions have intrigued historians, economists, and social theorists for better than a century and continue to be the subject of ongoing and often heated debates in the early twenty-first century.

Until recently, almost all efforts to explain industrialization and the attendant rise of Europe to world dominance have focused on Europe itself. Scholars have focused on one or several key factors that contributed to Europe's distinctive economic development, and then have gone on to claim that these factors appeared in Europe first or were more prevalent there than anywhere else. Their basic premise is that by the eighteenth century European society already was distinct and "exceptional," fully primed to make the leap into a new age of industrialization. Europe's tradition of political pluralism, its openness to technological innovation, its broad acceptance of commercial values, the rise of modern science (which encouraged rationality and technological innovation), its commitment to "industriousness" and the ethic of hard work, its legal protections of property rights, and its entrepreneurial spirit all set Europe apart from the "oriental despotisms" and social rigidities of Asia. So too did Europe's pattern of delayed marriage and smaller families, which by slowing population growth encouraged capital formation and kept wages high in comparison with other parts of the world (thus promoting both consumption and also the adoption of labor-saving machinery). Recent examples of such an approach are Eric Jones's *The European Miracle, Environments, Economies and Geopolitics in the History of Europe and Asia* (1981, 1987, 2003) and David Landes's *The Wealth and Poverty of Nations: Why Some Are So Rich and Some So Poor* (1998).

Other scholars have a darker view of European exceptionalism. Immanuel Wallerstein (*The Modern World System*, 3 volumes, 1974, 1980, 1989) has argued that European economic hegemony can be traced back to the sixteenth century, when there emerged a "modern world system" based on the exploitation by the European "core" of an African, Latin American and Asian "periphery," which supplied agricultural products, cheap labor, and mineral resources in return for European manufactured goods. Others have focused more narrowly on Europe's involvement in the slave trade, the profits from which provided capital for England's early factories.

Such Eurocentric views have been vigorously challenged in the last twenty years. Andre Gunder Frank, although an early disciple of Wallerstein, rejected the idea that Europe dominated the world economy in

the early modern period in his *Reorient: Global Economy in the Asian Age* (1998). In his view, the world economy had not one “center,” but several, of which China was the most important. Europe’s role in the world economy was hampered by its inability to manufacture goods that the rest of the world wanted, and it retained a place in Asian markets only because of its access to American silver. R. Bin Wong’s *China Transformed: Historical Change and the Limits of European Experience* (1997), and Kenneth Pomeranz’s *The Great Divergence: China, Europe, and the Making of the Modern World Economy* (2000) down-

Both authors warn of the dangers of making broad comparisons between large entities such as “Europe” and “China,” since each of these areas had a great deal of regional variation.

play the differences between China and Europe as late as the eighteenth century. Both authors warn of the dangers of making broad comparisons between large entities such as “Europe” and “China,” since each of these areas had a great deal of regional variation. A more productive approach in their view is to make comparisons between northwestern Europe and

England, the heartland of Europe’s early industrial revolution, and a similar region in China, the lower Yangzi delta. Here they find more similarities than differences in terms of life expectancy, levels of commercialization, rates of fertility, real wages, attitudes toward work, the consumption of luxury goods, and the expansion of handicraft industries and agriculture. Both regions in the eighteenth century were experiencing increased pressures from expanding population, and faced shortages of prime agricultural land.

If China and Europe were more similar than different in the 1700s, what then explains the “great divergence” between the two societies after 1800? Wong believes politics played a key role. The relatively small competing states of Europe were better able to adapt to economic growth and development, while the leaders of China’s unified empire were more committed to preserving the status quo. Pomeranz emphasizes the importance of Europe’s American empire, which became a market for Europe’s manufactures, a safety valve for excess population, a source of precious metals, and producer of profit from plantation-grown crops such as sugar, cotton, and tobacco. Both authors agree that Europe’s industrialization depended on a fluke of nature, namely the rich coal deposits that stretch from northern England and Scotland to northern France, Belgium, and northwestern Germany, Europe’s industrial heartland. The availability of coal allowed Europeans to escape from the “biological old regime” and the age-old dependence on wood, wind, and water as sources of power. China, in contrast, had large coal deposits, but in concentrations that were difficult to mine and were far distant from China’s most economically advanced regions. Thus geological accident is a major part of these two historians’ story of how and why human societies and economic relations were so utterly changed in the modern industrial age.

—James H. Overfield

■ Introduction: Agriculture

Agriculture is yet another human activity that underwent revolutionary changes in the eighteenth and nineteenth centuries. Millions of acres of previously uncultivated land in every continent were opened to farming. In some parts of the world new farming methods, new machinery, and new fertilizers were introduced. Major irrigation projects were undertaken in the American West, India, Sudan, and Egypt. Agriculture became ever more commercialized as large and small farmers began growing crops that were carried by steamships and railroads to markets as many as thousands of miles away. As a result, although the world's population increased from approximately 700–750 million in 1750 to 1.2 billion in 1900, food production increased at an even faster rate, despite the fact that many millions of acres were turned over to the production of nonfood items such as cotton and “nonessential” consumer goods such as coffee, sugar and tea. As a result, by 1900, despite catastrophic famines in India, China, and Japan, most people were eating more and better food for less money than their forebears had a century and a half earlier. So great was the increase in agricultural productivity that beginning in the 1870s agricultural prices plummeted, and farmers, especially in Canada, the United States, and Europe, faced the unprecedented problem of overproduction of wheat, corn, and other basic farm products.

Although the broad picture of world agricultural production between 1750 and 1900 is clear enough, there was a great amount of regional variation. In Europe, for example, increased agricultural production partly resulted from the enclosure of common land and the introduction of new methods of crop rotation. Specifically this meant the abandonment of the fallow system, in which a half or one-third of a farmer's land was allowed to revert to pasture in any given year in favor of rotating grain crops with fodder crops such as turnips or soil-enriching legumes such as clover. Such innovations were uniquely suited to the climate, soils, and farming patterns of northwestern Europe but had little effect on

agricultural practices in the rest of Europe and other parts of the world.

Much the same thing can be said about the role of mechanization. During the nineteenth century inventors and tinkerers in Europe and the United States developed hundreds of labor-saving devices that affected every phase of the agricultural cycle, including soil preparation, seeding, hoeing, ridging, fertilizing, weeding, harvesting, and threshing. By midcentury, steam engines mounted on wheels were introduced to drive mechanical farm machinery by way of flexible belts and wire cables, and in 1892 John Froelich produced the first gasoline-powered tractor in Charles City, Iowa.

The mechanization of agriculture was a major contributor to increased agricultural productivity in parts of Europe, the Americas, and certain areas of European settlement such as Australia. The vast majority of world's farmers, however, continued to use traditional technologies. Even in Europe and North America, investment in major machinery made little economic sense unless a farm was larger than 40 or 50 acres (16–20 hectares). This meant that even in Europe, mechanization proceeded slowly in the nineteenth century. In France, for example, where small farms predominated, in 1900 out of more than 5 million farms, only 200,000 had introduced the newly developed reversible Brabant plow, and only 50,000 were using mechanized reapers.

Mechanical innovations in agriculture were almost totally lacking in most of Africa and Asia, except in those instances where Europeans had invested in large farms designed to produce goods for export. In Japan and China, where the average farmer's plot was between 2 and 3 acres (0.8 and 1.2 hectares), agricultural output increased in the 1800s, but this resulted mainly from more intensive farming through careful soil preparation, seed selection, irrigation, fertilization, weeding, insect control, and better methods of storage. Increases also were achieved through the farming of new lands, especially in Japan, where during the Meiji period

the large northern island of Hokkaido began to be farmed to produce wheat, potatoes, and beef.

Even if many of the specific features of the West's agricultural revolution (new methods of crop rotation, mechanization, selective breeding of livestock, and the use of new fertilizers) left most of the world untouched, Europe and the United States indirectly affected world agriculture because of their ever greater demands for food for their growing populations and their need for agricultural raw materials for their industries. The explosion of sheep raising in New Zealand and Australia was a direct response to the European demand for wool and meat. Similarly, in Latin America the opening up of new lands for agriculture mainly resulted from European demands for beef, mutton, sugar, coffee, tobacco, wheat, and bananas. Cotton became a major cash crop in India, Africa, and the American South to meet the demands of European textile mills.

Even more directly, Europe put its stamp on worldwide agriculture through imperialism. Colonial administrators were universally committed to encouraging agricultural development as a way of increasing tax revenues and simultaneously producing commodities for export or industrial use in the home country. Thus, they invested substantial sums (often from taxes on their colonial subjects) on irrigation projects in addition to road building and railroad construction to bring agricultural products from the interior to coastal ports. Where it was feasible, they were willing to rely on domestic farmers to produce the goods they needed. In Africa major success stories took place in Senegal, where peasant farmers shifted to peanut culture; in Uganda, where small-scale native cultivators dominated cotton production after the introduction of the railroad; and in the Gold Coast, where many thousands of small farmers turned to growing cocoa, making the colony the world's largest exporter of cocoa by 1914.

When local farmers were unwilling or unable to make the transition to growing cash crops, colonial regimes resorted to various forms of coercion. Beginning in 1830, for example, the Dutch government required each village in Java and other parts of the Dutch East Indies to set aside 20 percent of its land for the production of

indigo, sugar, coffee, tea, tobacco, or pepper. In German East Africa, beginning in 1902 colonial authorities required each village to meet quotas for cotton production, a policy that was bitterly resisted; in 1905 it led to the Maji-Maji Rebellion and the deaths of as many as 200,000 insurgents and innocent victims. In other parts of Asia and Africa, land was expropriated and either handed over to European corporations or purchased by European firms at favorable rates. Although such arrangements largely failed in Africa, they proved successful in India, where British-owned plantations made India the world's largest producer of tea by the early 1900s. In the British colonies of Kenya and Southern Rhodesia, regions with soil conditions and climate similar to those in Europe, the best land was handed over to white farmers from Europe or South Africa. Native cultivators were relegated to marginal native reserves, excluded from growing crops for export, and were expected to provide cheap labor for the white landowners. Agricultural productivity in these white settler colonies grew but at the cost of poisoning African-white relations throughout the colonial period and beyond.

—James H. Overfield

African Agriculture

In the short run, colonial rule in Africa opened new economic opportunities and offered a vast increase in trade for African peasant farmers. Although many prospered, their success had by 1914 sown seeds for the future ruin of African agriculture.

In the white settler colonies of Algeria, Kenya, Rhodesia, and South Africa colonial rule from the beginning was accompanied by seizure of fertile African land. Nevertheless, enough land was left for the expansion of African peasant farms, many of which were not far from the main European markets and railway lines. As a result, there were substantially more positive and successful responses by African agriculturists to market opportunities than has usually been indicated, and hundreds of thousands of African peasants successfully adapted their existing farming methods to the new conditions rather than becoming wage laborers for white colonists. In Rhodesia bags of maize fetched

30–40 shillings at the turn of the twentieth century. Many people in southern Africa found livestock trade an easy way of meeting their financial obligations. Thus in southern Africa in general and South Africa and Rhodesia in particular, major agricultural changes took place, with new crops such as market vegetables being grown as demand rose. Similarly, produce in Kenya accounted for more than half of Kenya's exports before 1914. Taking advantage of opportunities offered by colonial rule, the Luo were successful in growing groundnuts, sesame, and maize, all of which were carried by the railway from Kisumu to Mombasa and exported.

In West Africa peasant farmers introduced major innovations, such as the shift to new crops for export. Exports of palm products recovered from the 1880–1900 slump and expanded after 1900. Between 1892 and 1911 exports of cocoa from the Gold Coast grew from nothing to 40,000 tons. In Senegal the production and export of groundnuts (peanuts) rose between 1885 and 1914 at an annual average rate of growth of 8.8 percent. During 1884–1885 export of groundnuts reached 45,000 tons. Railway building in the 1880s boosted the production of groundnuts by causing producers to extend the areas under cultivation. By 1914 groundnuts had also become an important export from northern Nigeria. The successful production of export crops in the nineteenth century by African peasant producers kept white planters out of West Africa. Arguably, African enterprise made European enterprise unnecessary.

The growth in African agriculture by 1914 was beginning to decline. In settler colonies, white farmers slowly forced the African peasants off their fertile land, either by direct evictions or by imposing such a battery of financial and other burdens that the peasantry elected to go into reserves. The period from 1900 to 1914 saw the decline in cereal production in Algeria and Tunisia as a consequence of seizure of the natives' best land. Concentrating on the years 1870–1914, the historian Colin Bundy has argued that the initial rise of South African peasantry was followed by their well-documented fall as a consequence of living on eroded and overcrowded land. In Rhodesia, African agriculture was steadily undermined from roughly

DEVELOPMENT AND UNDERDEVELOPMENT OF AFRICAN AGRICULTURE TO 1914

Only recently have historians offered a complex description of the effects of colonialism on African agriculture and land use. One early interpretation, from historian Walter Rodney, stressed the destructive impact of colonial rule on traditional African agriculture, telling a story of continuous depression and disintegration. More recently, relying on data from Kenya, Rhodesia, and West Africa, two historians have challenged the underdevelopment thesis put forward by Rodney. Paul Mosley argues that there is little statistical support for the view that colonial policy crippled the growth of indigenous African agriculture, while A. G. Hopkins argues that colonialism brought impressive economic growth in West Africa, especially in colonies that developed export crops. Earlier historians had overlooked and underestimated a phenomenon to which more recent historians have drawn attention: an initial period of early prosperity in peasant production followed only later by the symptoms of agrarian decay and underdevelopment.

—Takafavira Zhou

1908 onward when settlers turned to agriculture and pushed Africans into reserves. Successful agriculture in precolonial Africa was based on land rotation cultivation, which became difficult once Africans were brought under rigid European control. Once settled in the increasingly overcrowded reserves, the Shona and Ndebele in Rhodesia could aspire to become little more than subsistence cultivators and migrant laborers. Similarly, by 1914 thousands of Kikuyu, Luo, and Luyia in Kenya had settled on the coast to work in coconut or sisal plantations.

In West Africa, cash crop production was promoted in ways detrimental to the long-term benefits of the African economy. The overemphasis on groundnuts in Senegal and Gambia led to a dangerous dependence on one crop and to a decline in the production of food crops. Between 1906 and 1914 Senegal and Gambia had to import rice from India and China. The Ivory Coast became heavily dependent on rubber and cocoa up to 1914. Dahomey's economic growth

declined under French colonialism. The Dahomeyan farmers were given detailed instructions on what crops to cultivate and where, when, and how to sow, harvest, and store them. Cotton production in Portuguese East Africa and Tanganyika in the period up to 1914 undermined African agriculture, as cotton was meant for export and disturbed local food production. Thus by 1914 the basis for the future ruin of African agriculture had been established, and its viability and sustainability had increasingly come under threat.

Indian Agriculture under British Rule

British rule led to significant changes in Indian agriculture. The colonial administration's main goal was to increase revenue from agriculture through increased production as well as the standardization and improved collection of taxes. The intended and unintended consequences of these efforts included the transformation of systems of landownership and the occurrence of several severe famines.

Beginning under the East India Company in Bengal and later extended to the rest of India, efforts were made to standardize landownership and tax rates on land so that tax revenue on land could be increased and collected more efficiently. In precolonial India, land had been subject to different systems of collective ownership and control, and the British sought to replace these with a new system that reflected British ideas of proper landownership. With the establishment of the Permanent Settlement, an agreement between the East India Company and the Bengali landlords, many peasants were left

landless after zamindars were established as the new landlord class. One effect of the replacement of collective ownership with individual ownership was that land became a commodity for sale, and the zamindars could be dispossessed of their land if they failed to produce sufficient revenue for the state.

In addition, Indian agricultural production was subject to the British imperial preference system in terms of what crops were grown. The government promoted the cultivation of cash crops such as opium, tea, indigo, and cotton for export, which reduced the amount of land available for food crops. Up to 1860, Bengal was a major supplier of rice to the British colony of Sri Lanka, but exports declined as the population in Bengal grew. The importance of revenue can be seen in the creation by the government of India of the Revenue and Agriculture Department in 1881. The department attempted to introduce improvements in agriculture, but the emphasis was on the collection of revenue. In the late nineteenth century the government invested in an expansion of irrigation and agricultural research. The government built large canals for irrigation, including the Ganges Canal and the Betwa Canal in the United Provinces in northern India and the Nira Canal in what is now the west Indian state of Maharashtra. The government also brought new land into cultivation by clearing land and providing irrigation facilities to settlers. The prime example of this was the Canal Colonies of Punjab, now part of Pakistan. With its numerous rivers, Punjab had numerous irrigation works built over several centuries, but the decision to build the Canal Colonies was partly political. The Canal Colonies were a reward to loyal Punjabi soldiers who had been instrumental in suppressing the Indian Mutiny (Sepoy Rebellion) of 1857 centered in the province of Oudh. As a result, the province became one of the most prosperous in the country.

The British government also invested in agricultural research with the creation of the Imperial Agricultural Research Institute at Pusa in 1905. The institute was relocated to Delhi after a major earthquake in 1934. The institute developed new varieties of wheat, rice, and other crops and conducted thousands of field experiments, but it is unclear to what extent

► FAMINE IN INDIA

During British rule, India faced numerous serious famines. Major famines occurred during 1769–1770, 1832–1833, 1837–1838, 1865, 1868–1869, 1876–1878, 1889, 1892, 1897, and 1899–1900. In some cases, government policies inadvertently or unthinkingly exacerbated food shortages or otherwise increased the misery of the population.

One notorious example is the famine of 1769–1770 that devastated Bengal. Approximately one-third of the population (or ten million people) died, but despite this the government, through the use of force, managed to collect more tax revenue in 1781 than it did in 1768.

The government attempted to prevent famines through improvements in agriculture by investing in irrigation, but these efforts were piecemeal, and the famines continued. In response to the famine of 1837–1838 in which some 800,000 people died, the government initiated construction of the Ganges Canal, but construction was delayed several times and plagued with construction flaws. Following the famine of 1876–1878 the government created the Famine Relief and Insurance Fund, which paid for several new canals in Punjab, the United Provinces, and Maharashtra.

—Eric Strahorn

this benefited Indian agriculture. The new seed varieties were sometimes more productive than older varieties, but there was no extension system through which they could be distributed to farmers. Moreover, this research did not address the basic problems of Indian agriculture, which included inadequate and antiquated irrigation facilities, inefficient small holdings, and a heavy tax burden.

The Cultivation System in the Dutch East Indies

The Cultivation System, or *Cultuurstelsel*, was a revenue system implemented by the Dutch colonial government, mainly in Java, in 1830. It forced farmers to use part of their existing

farmland or to bring land under cultivation for the production of cash crops, the sale of which would enable them to pay the land tax.

The system was introduced by Governor-General Johannes Van den Bosch to bolster the depleted economy of the Dutch East Indies after the Java War (1825–1830) and took over practices of indigenous rulers, who taxed their people in the form of forced deliveries of agricultural products. In areas of Java under direct colonial rule, rural villages were compelled to use a maximum of one-fifth of their land to produce cash crops that would be delivered to government officials; they also had to provide *corvée* labor for a maximum of one-fifth of the year. In return, until 1836 villages were exempted from the land tax and other taxes in kind if a sufficient amount of produce was delivered. After 1836 the land tax was levied in full, and farmers received full payment for their produce. Van den Bosch believed that the system would encourage Javanese farmers to produce export crops beyond what they needed to pay the land tax.

Junior officials of the colonial government (the *controleurs*) implemented the system through local rulers: the *bupati* (regents) and *camat* (district heads). They determined the crops to be grown and the amount of land to be set aside or newly cultivated. They also requisitioned the unpaid labor to maintain, harvest, and transport the crops. The orders were passed to village heads, who then secured the cooperation

of villagers. These officials arranged payment for the deliveries at predetermined prices and levied the land tax at the time of crop payments. Any surplus from the sale of produce above the land tax was credited to the farmer. Both colonial and Javanese officials had an interest in making the system work because they received a percentage of the revenues.

After establishing the Cultivation System, Van den Bosch became minister of colonial affairs during 1834–1839 and designed the positive net revenue (*batig slot*) policy. Under the policy, the government of the Dutch East Indies would be expected to generate budget surpluses for remittance to the treasury in the Netherlands. The Cultivation System achieved many of its goals. Indigo and sugarcane were the first crops to be produced; coffee, tea, tobacco, and pepper were later added. Government revenues increased, and by the 1870s the colonial government remitted approximately one-third of the Dutch government's budget.

Despite its financial benefits, in the Netherlands the Cultivation System had harsh critics. One group opposed it because of the burden it placed on Javanese farmers, who were forced to grow unfamiliar crops and neglect the production of food crops. This in turn caused food shortages. Some blamed the system for the famines in central Java in 1849 and 1850, and others cited instances of torture and other harsh punishments when villagers failed to meet their quotas.

The benefits that Dutch firms drew from the system also provoked controversy. Sugar contractors operated with guaranteed and generous margins set by the colonial government. The Nederlandsche Handel-Maatschappij (Netherlands Trading Society), which had received a monopoly on the transport and sale of agricultural exports in 1824, became the biggest private company in colonial Indonesia. Both the Netherlands Trading Society and the shipping companies it paid to transport Cultivation System products were tacitly allowed to charge above-market rates for their services.

Private entrepreneurs, excluded from most of rural Java as a result of the state monopoly, also objected to the Cultivation System. They mobilized public opinion and members of

Parliament to support opening up Java to private enterprise. Beginning with the passage of the Agrarian Law in 1870, the Dutch Parliament gradually phased out the Cultivation System. This law allowed foreign investors to negotiate short-term leases with indigenous landholders or purchase unoccupied land from the colonial government under long-term leases. The compulsory cultivation of sugarcane also was abolished in 1870. Forced cultivation of perennial crops continued, although tea and coffee estates were gradually handed over to villages. In 1915 the last government-owned coffee plantations were abandoned.

White Settler Farming in Africa

White settler farming changed the economic, social, and political history of both Kenya and Southern Rhodesia. In Kenya, settler agriculture emerged out of the bankruptcy of the Imperial East Africa Company following the construction of the Mombasa-Kisumu railway line between 1896 and 1901. The company decided to attract white settlers in order to develop export agriculture. Similarly, the British South Africa Company's failure to find a Second Rand (i.e., a valuable gold mine) in Rhodesia forced white settlers to turn to agriculture by 1908.

In both colonies the state took a proactive policy to promote the growth and expansion of white settler farming. The appropriation of fertile African land in the high veld (elevated open grasslands) and near transport networks from the inception of colonialism in 1890 for

Rhodesia and in the period 1901–1905 for Kenya was the basis for the successful white settler agriculture in both areas. The 1902 Crown Lands Ordinance made settlement in Kenya attractive, as it established the legality of selling, granting, and leasing unoccupied land and allowed land to be leased for 99 years at a nominal rent per acre. By 1914, 4.5 million acres (1.8 million hectares) had been leased to about 1,000 settlers.

Similarly in Rhodesia, the Estates Department was set up in 1908 specifically to promote European settlement. In the same year the Department of Agriculture was reorganized to enhance its ability to place a wide range of extension facilities at the disposal of the new white settler farmer, and in 1910 the department took over the grading of maize for export. The company itself developed an interest in tobacco, citrus, and ranching. A Land Bank was set up in 1912 with a share capital of £250,000 to make credit available for persons of European descent only. The bank was the driving force behind successful settler agriculture in Rhodesia and induced white farmers particularly in Kenya (where one was not established until 1930) to demand something comparable.

The agricultural achievements of the white settlers before 1914 were considerable in both Kenya and Rhodesia. In Kenya, settlers pioneered many new crops. Coffee of high quality was first planted in 1899 near Nairobi, became an important crop after 1910, and by 1920 was the most important crop in Kenya. Sisal and tea were first planted and grown at Thika and Limuru in 1904, respectively. The crops became important after 1914, with sisal becoming the country's second most important plantation crop. In the period up to 1914 rubber was tapped and was an important export. Lord Delamere (1870–1931), an English aristocrat who held a lease for a 100,000-acre (40,469-hectare) farm for which he paid £200 per year for rent, played a leading role in fostering the growth of white settler farming in Kenya. He succeeded in growing wheat in spite of rust disease, and in 1909 a flour mill was opened in Nairobi. Through his agricultural experimentation, cures to livestock illnesses were discovered, and the foundations of the dairy, beef, and sheep industries were laid down.

COMPETITION AND FRICTION BETWEEN WHITE SETTLERS AND AFRICAN FARMERS

Prior to the rapid expansion of European farming in Kenya and Rhodesia, white landowners had very little reason to turn Africans off their land since they could extract from them crops, rents, or labor as desired. African farmers also played a vital role in food production. The expansion of white settler farming in Kenya and Rhodesia in the early 1800s changed the situation. By 1914 competition and friction between white farmers and Africans forced many Shona and Ndebele into reserves in Rhodesia, as was the case with the Kikuyu, Luo, Luyia, and Maasai in Kenya. Thus by 1914 a strong foundation for successful white settler agriculture had been established in Kenya and Rhodesia, while indigenous groups were displaced.

—Takafavira Zhou

Africans work on a tobacco farm under the eye of a white owner or overseer in Rhodesia, between 1890 and 1925. (Library of Congress)

Similarly, settler agriculture in Rhodesia revolutionized the production of maize, tobacco, and cattle ranching during the period under review. Maize production rose dramatically from 45,815 bags in 1903–1904 to 634,133 bags in 1913–1914. Exports, mostly to Britain, rose from 11,442 bags in 1909 to 202,105 bags in 1914. Tobacco, which was to develop into the mainstay of European farming and a major support of the Rhodesian economy, also registered tremendous growth. European farmers began to grow the crop avidly, especially in Mashonaland, and production rose swiftly from 132,310 pounds (about 60,000 kilograms) in 1909–1910 to more than 3.1 million pounds (1.4 million kilograms) in 1913–1914. Cattle ranching expanded over much of the Matabeleland high veld. Cattle looted from the Shona and Ndebele were upgraded by crossbreeding with bulls imported from northern Rhodesia, Nyasaland, and South Africa, which helped to add weight and quality to the existing durability. Some 33,000 head of cattle were imported in the years 1909–1913, and the number of European-owned cattle rose sharply from 38,611 in 1907 to 341,878 in 1914.

White settler farming in Kenya and Rhodesia inevitably gave rise to conflict and competition between European farmers and Africans. Thus by 1914 the Shona and the Ndebele in Rhodesia, like the Kikuyu, Kamba, and Maasai in Kenya, were locked in conflict and competition with white settlers over markets, cattle, and land.

Farming in Meiji Japan

While there was some technological innovation in agriculture during the Meiji period, farming techniques remained quite unchanged. Predominantly a function of the family, farming involved the cooperation of the entire community to maintain the extensive irrigation systems that flooded and drained the rice paddies at the required times. Land plots, which had been partitioned among descendants, were generally too small to utilize the mechanized devices of the industrial revolution, and Japanese agriculture continued to be labor-intensive through the end of the Second World War.

Although there were few technological changes, there were many social changes that impacted Japanese farming. Industrialization led to increased urbanization and factory-produced textiles. In preindustrial Japan, farming families heavily supplemented their income by producing homespun textiles; however, the factories of cities such as Osaka could produce a better product more inexpensively. To compensate for this loss of income, many daughters from farming families were sent to work in the textile mills or brothels of the cities. While these factory girls experienced low wages and many hardships, the journals of many of them compared conditions in the cities favorably to their existence in the countryside. The attraction of urban life and the poverty of rural Japan left a lasting impact on Japanese society that can still be seen in the early twenty-first century.

Japan's farmers experienced many economic changes in the Meiji period as well. With administrative centralization, local control of taxes, based on traditionally established levels of agricultural productivity, was replaced by a national land tax. Initially, this provided individual ownership for lands previously controlled by military aristocrats, but when farmers were unable to pay the assessed taxes, they lost their land, and the rate of tenant farming increased dramatically. A growing disparity between absentee landowners and tenant farmers emerged. The government in turn used tax revenue to promote urban industrialization and Japan's growing military. It was not until the development of party politics toward the end of the period that rural interests were

► FARMING IN HOKKAIDO

One area of Japan that stands as an anomaly with regard to agriculture is the northernmost island of Hokkaido. Largely unpopulated until colonization efforts of the Meiji government, the vast areas were divided utilizing a basic grid pattern of approximately 12-acre (5-hectare) rectangular lots. Undoubtedly the influence of U.S. advisers to the Meiji government had much to do with the devel-

opment of Hokkaido's agricultural base. Not only are farms bigger, but they are not centered on an agricultural village. Rather, they are dispersed similarly to the midwestern United States. The climate and seasons stipulate very different crops as well, and wheat, barley, rye, and potatoes are common crops.

—David Rands

able to exert influence over some measure of the national budget. Through most of the Meiji period, farmers suffered extreme poverty. The necessity of selling all the rice produced meant that the rural population rarely ate the white rice so commonly associated with agrarian Japan.

Thus, while the techniques of farming in Japan changed little over the centuries, the Meiji period and industrialization brought dramatic social and economic changes. Migration to urban centers increased, and rice, which had been the economic foundation of the archipelago, was replaced by a land tax that was not nearly as accommodating for the agrarian population. Farmers who were peasants under the Tokugawa system became petty landowners under the new Meiji system and then tenant farmers as their land was transferred to the more wealthy absentee landlords. Unlike many industrializing countries, however, the collectivization of land into large farms never occurred, and families farming their individual plots of land are a continuity that makes the agriculture in the Meiji period so similar to everything that came before it.

The Opening of the American Great Plains

During the nineteenth century immigrants streamed across the breadth of America's vast hinterland, where a new life awaited them in the Great Plains. Although they were preceded by Native Americans, who had lived in the region for centuries, and more recently arrived cattlemen, it was the farmer/settler who truly transformed this land.

Climate and vegetation, rather than any specific boundary, separates the prairies and the Great Plains. In particular, the Great Plains is drier, with only meager rainfall of between 15 and 20 inches (38 and 51 centimeters) per year. In terms of vegetation, bunch grasses predominate in the Great Plains region.

Much of the region became U.S. territory as a result of the Louisiana Purchase under President Thomas Jefferson, who looked to the day when it would be populated by hearty American farmers. To achieve such a goal, Congress passed legislation to place much of the land of the West in hands of settlers of modest means. The Preemption Act of 1841 (and subsequent amendments) allowed settlers to file a claim for up to 160 acres (65 hectares) at a purchase price per acre established by the federal government. This act's purpose was in part to prevent speculators from purchasing western lands and pushing up prices. Another step that encouraged the settlement of the American West, and by extension the Great Plains, was the Homestead Act of 1862. This act enabled settlers to gain ownership of 160 acres if they resided on the property for five successive years and became a U.S. citizen

► BLACK KANSAS

The end of Reconstruction led to increased oppression for African Americans throughout the South. Many came to see Kansas, where John Brown had begun his campaign in the cause of abolition, as a place of refuge from oppression. Henry Adams, a former slave from Georgia, became an advocate of the exodus of blacks from the South in 1877. Along with perhaps 500 others, he formed a committee that subsequently sent out a group of approximately 100 investigators to Kansas and other parts of the Great Plains to determine if conditions might be suitable for African Americans to relocate. The result was the Great Exodus (1879–1881), the westward migration of perhaps 15,000 to 20,000 African Americans from throughout the South to the Great Plains. Soon black communities sprang up in Kansas towns such as Dunlap (1878), Morton City (1877), and Nicodemus (1879). The migration was motivated by dreams of freedom from oppression. In reality, those who migrated experienced varying degrees of integration, segregation, and exclusion depending upon the location where they finally resided and the time period involved. However, their greatest challenge was making a livelihood. Many encountered crop failures and financial ruin much like their white counterparts. A large number of the Exodusters, as they came to be called, remained in Kansas, while many others went farther west, and still others returned to the South.

—*John Leiby*

if foreign-born. While settlement of Kansas and Nebraska began in earnest in the 1840s and the 1850s, the region saw its largest influx of population in the 1870s and beyond.

The Great Plains was a region of demographic contrasts. The Native Americans were eventually subdued and marginalized to reservations. The railroads, which crisscrossed the Great Plains by the 1880s, provided incentives for settlement by selling land adjacent to their tracks and encouraging the slaughter of buffalo, the Plains Indians' chief food source. Throughout the region most immigrants were German speakers, not only from Germany itself but also from Alsace, Switzerland, Austria, and German-speaking Russia. English, Scots, Welsh, Irish, and

Canadians constituted the next largest contingent of immigrants. Most of the people who settled the region were not immigrants at all, but were U.S. citizens who had moved west.

The Great Plains' farming economy after 1870 is a story of boom and bust. This region's climate is characterized by harsh winters and hot summers. An example of these extremes is the experience of Glendive, Montana, in 1893, when there was a 164-degree differential between its winter low of 47 degrees below zero and a summer high of 117 degrees. In addition to dealing with these temperature extremes, settlers also had to endure blizzards and droughts. Because the region lacks major rivers, irrigation was not an option. Consequently, most Great Plains farmers took up dry-farming techniques, which involved plowing deeply in the fall and packing down the subsoil, then during the summer plowing repeatedly to produce a dust mulch. Moreover, many left parts of their lands fallow to retain moisture, while others planted drought-resistant varieties.

Any success for a Plains farmer in the late nineteenth century came from mechanization. All sorts of machines appeared, especially during the 1880s and 1890s, to make farming more productive and potentially profitable. To afford these machines, however, most farmers had to mortgage their land. Periods of drought or the appearance of grasshoppers could bankrupt a Plains farmer, forcing him to abandon farming and leave the region. On the other hand, periods of bounty such as occurred during most of the 1880s allowed farmers to pay off their debts and even set aside some savings. The 1880s was a banner decade for Plains farmers, as there was a large demand worldwide for corn and wheat. Problems began in 1889 as a result of drought and increased world competition and continued during much of the 1890s. By the turn of the century the standard 160-acre homestead was proving to be too small to be profitable. To address this problem Congress passed the Kincaid Act, which enabled settlers to obtain homesteads of up to 640 acres, except on lands deemed suitable for irrigation. However, many farmers had failed, and many towns had been depopulated before the Kincaid Act could bear fruit. Only after 1900, when rainfall was ample and the size

of farms increased, did Plains farmers return to prosperity.

Changes in Agricultural Technology

Following centuries in which the tools and methods of agriculture underwent few appreciable changes, after 1750 farmers, especially in Europe and the United States, adopted new technology to increase production. As Europeans colonized Australia and parts of Asia and Africa, they introduced new technology in these continents, changing the way some people farmed. In some instances indigenous people resisted European innovations, preferring to improve agriculture by more intensive farming and opening up new lands to cultivation. Thus the pace of technological change varied across continents and across countries.

Farmers used technology to ease or quicken tasks such as breaking ground, planting seeds, cultivating the soil to remove weeds, harvesting crops, and processing crops for consumption or sale. Since antiquity farmers had used the plow to break ground. After 1770 the wooden plow with iron shares gave way to an all-iron plow, first in England and then on the continent. In 1797 New Jersey inventor Charles Newbold patented an iron plow, which spread throughout the northern United States and less rapidly in the South. In 1833 Illinois blacksmith John Lane attached steel strips to the moldboard, and in 1837 Illinois inventor John Deere patented a plow with steel shares for cutting the sod of

the Midwest and West. Eager to modernize, Japanese officials coaxed peasants in the 1870s to replace their traditional scratch plow with a deep-tillage plow. Such a plow was difficult to use, however, and after 1900 Japanese peasants adopted a plow intermediate between the scratch and deep-tillage plows, one that worked well on wet soils.

Methods of planting also experienced rapid changes. Originating in England, the seed drill replaced broadcasting by hand throughout the country and in parts of the United States by 1850. The seed drill made it easier to plant crops in straight rows, allowing farmers to cultivate between rows. After 1830 farmers in the United States adopted a single-row cultivator and after 1840 a two-row cultivator.

New irrigation projects were undertaken to feed crops where rainfall was scant. In Europe and the United States, steam engines were used to pump water from streams and lakes into fields. Embarking on a plan of rapid modernization during the Meiji era, Japan adopted Western technology, irrigating its fields with water pumped from canals by steam engines in the 1890s. In contrast, to boost cotton production in Egypt the modernizing Egyptian ruler Muhammad Ali (1769–1849) spurred farmers to adopt the *saqqaya*, a wheel that carried water from canal to field and had been used in the Middle East for centuries. By the mid-nineteenth century, Egypt had exported the *saqqaya* to Sudan for irrigating fruits and vegetables.

Once ripe, a crop was ready to harvest. Short of labor, Europeans replaced the sickle (a curved steel blade fitted into a handle) with the scythe (a long, curving blade with a sharp edge, made fast to a long handle, called a snath, that is bent into a form convenient for use) for cutting grain after the Napoleonic wars. In 1833 Ohio inventor Obed Hussey (1792–1860) patented a mechanical reaper, and the next year Virginia inventor Cyrus McCormick (1809–1884) patented his own reaper, although McCormick always claimed priority. McCormick toured Europe to demonstrate his reaper and in the 1860s began to increase sales, particularly in England. In 1900 the reaper cut 80 percent of grain in England, a percentage the United States had reached 30 years earlier. By contrast, French farmers cut

➤ CYRUS MCCORMICK INVENTS THE REAPER

Cyrus McCormick described his invention as follows:

“Very soon after my father abandoned his machine, I first conceived the idea of cutting upon the principle of mine, viz., with a vibrating blade operated by a crank and the grain supported at the edge, while cutting, by means of fixed pieces of wood or iron projecting before it. . . . A temporary experimental machine was immediately constructed and the cutting partially tried with success in cutting, without a reel, a little wheat left standing for the trial; whereupon the machine was improved and the reel, which I had in the meantime discovered, attached; and soon afterwards (the same harvest) a very successful experiment was made with it in cutting oats in a field of Mr. John Steele, neighbor of my father.

The machine at the time of this experiment contains all the essential parts that were embraced in the patent of June 21, 1834. It had a platform; the straight sickle with a vibrating action by a crank; the fingers or stationary supports to the cutting, at the edge of the blade and projecting forward into the grain (the double and counter action from the crank, as patented, was abandoned on being further tested); the reel; and the

Cyrus McCormick invented the first practical grain reaper, and went into large-scale production of the farm machines in the 1840s. (Jupiterimages)

general arrangement by which the machine was (about) balanced upon two wheels.”

—Christopher Cumo

Source

Cyrus McCormick, quoted in Norbert Lyons, *The McCormick Reaper Legend: The True Story of a Great Invention* (New York: Exposition Press, 1955), 77–78.

only 11.5 percent of grain by reaper in 1892, and Germany tallied only 6 percent by reaper in 1895. Perhaps the quickest adoption of the reaper was in South Australia, where as early as 1867 it cut 89 percent of wheat. McCormick’s company, International Harvester, sold the first reapers to farmers in Manchuria in 1909, and by 1912 the company was selling in Manchuria several hundred reapers a year along with mowers, seed drills, harrows, and rakers.

Once harvested, a crop was ready to process. Before 1750, grain farmers used the flail, a manual threshing device consisting of a long wooden handle or staff and a shorter free-swinging stick attached to its end, to separate the grain from the chaff. After 1750 farmers in Europe adopted the winnowing machine for this process. Originating in Scotland in 1786, the threshing machine spread to England, where farmers threshed half

their wheat by machine by 1850. By 1880 the thresher had supplanted the flail everywhere in England, although progress on the continent was slow. By 1900 farmers threshed only one-third of grain in Poland and flailed the rest. By 1907 the thresher had at last replaced the flail in Germany, although steam powered only one-third of these machines and horses the rest. In the United States inventors Hiram and John Pitt in 1836 patented a steam thresher, which in the 1840s spread throughout the East and Midwest. In the 1840s American farmers began to adopt combines, which both harvested and threshed grain. Combines were large, required enormous teams of horses to pull them, and were suited only to the vast tracts of the prairie.

Grain was not the only crop to process. In 1793 inventor Eli Whitney (1765–1825) patented the cotton gin for removing seeds from lint,

easing and quickening a job that had been monotonous and slow by hand. In the nineteenth century the cotton gin spread with cotton culture from Georgia to Texas, and in 1893 the Chinese civil servant Zhang Zhidong imported the cotton gin to China's Hubei and Hunan provinces. More than China, India was a case of technological imperialism. The British imported into India the two-roller mill for extracting juice by crushing sugarcane between rollers. Between 1874 and 1891 India built 250,000 mills. The jewel of British efforts was the sugar factory in Kanpur, India. Built in 1884, the factory had mills to extract juice from cane, evaporators and boiling pans to drive off water from the uncrystallized syrup, and centrifuges to separate sugar from syrup. By 1914 Kanpur had 7 such factories. The Sanuki-Shido Factory in Japan was in 1878 the first to use steam to power the mills and centrifuges. By 1895 Taiwan had roughly 1,000 sugar factories, and in 1900 the Philippines had 1,075.

A constant in agriculture for centuries, the horse gave way in the twentieth century to the tractor. In the 1890s the first tractors were steam-driven. The heavy tractors bogged down in mud, although under ideal conditions the steam tractor could harvest 100 acres (40 hectares) a day. By 1900, U.S. companies were manufacturing some 5,000 steam tractors a year. In 1901 Iowa inventors Charles Hart and Charles Parr attached a gasoline engine to the frame of a tractor and in the first decade of the twentieth century halved the weight of their tractor from 10 to 5 tons while increasing horsepower to 30. By 1909 American firms were manufacturing 2,000 tractors a year.

In raising the productivity of agriculture, technology coaxed a surplus of food from the land. This surplus fed more mouths, spurring an increase in population. At the same time technology decreased the demand for labor. The farm became unable to absorb the increase in population. People streamed into the cities, creating a reservoir of labor for industry.

Agriculture and Science

The application of science to agriculture grew out of the Enlightenment conviction that science could improve the lives of ordinary people. Because most people farmed, it was natural for scientists, many of them inspired by humanitarian ideals, to use their knowledge to help farmers grow more food. Into the nineteenth century, however, many farmers resisted efforts by scientists to undertake ambitious programs of experiments related to agriculture. Such skeptics believed that farmers themselves could increase production by comparing the yield of different crop varieties or trying out different rotations of crops. Such critics felt that scientists should limit their activities to policing the notoriously unscrupulous fertilizer industry by analyzing fertilizers for truth in labeling. Scientists countered, however, that only they were trained to do the systematic and controlled experiments necessary to achieve reliable results.

Governments responded by creating agricultural experiment stations to satisfy both farmers by analyzing fertilizers and scientists by giving them money and facilities for experiments. Wealthy entrepreneur John B. Lawes (1814–1900) created the first experiment station in Rothamstead, England, in 1837, and the German principality of Saxony, using Rothamstead as its model, funded the first government-sponsored experiment station in German-speaking lands in 1851. From England and the German principalities, experiment stations spread throughout Europe and the United States.

➤ JUSTUS VON LIEBIG ON SCIENCE AND AGRICULTURE

The German chemist Justus von Liebig (1803–1873) helped pioneer the field of organic chemistry, founded a company that produced the “Oxo” beef bouillon cube, and was an early proponent of the scientific study of agriculture. He analyzed the effects of various chemical nutrients on crops, with a particular interest in nitrogen, and helped devise early commercial fertilizers.

“Perfect Agriculture is the true foundation of all trade and industry—it is the foundation of the riches of states. But a rational system of Agriculture cannot be formed without the application of scientific principles; for such a system must be based on an exact acquaintance with the means of nutrition of vegetables, and with the influence of soils and action of manure upon them. This knowledge we must seek from chemistry, which teaches the mode of investigating the composition and of studying the characters of the different substances from which plants derive their nourishment.”

Justus von Liebig, *Chemistry and Its Application to Agriculture and Physiology* (Philadelphia: T. B. Peterson and Brothers, 1840), 3–4.

From the outset, scientists, sure that they could do more than police the fertilizer industry, chafed at their regulatory duties. Yet such duties increased in the 1870s when governments in Europe and the United States required scientists at the experiment stations and other public agencies to analyze the contents of insecticides for truth in labeling. Some scientists, eager to retain the goodwill of farmers and government, complied, but others put their energies into the emerging sciences of agricultural chemistry, plant pathology, and entomology. German chemist Justus von Liebig (1803–1873) in his *Chemistry and Its Application to Agriculture and Physiology* (1840) inspired scientists to search for the laws of soil fertility, much as the great English scientist Isaac Newton (1642–1727) had

discovered the laws of gravity. No less important in spurring ties between agriculture and science was the Irish Potato Famine of the 1840s. The catastrophe spurred scientists to seek its cause, and in 1861 German botanist Anton de Bary (1831–1888) identified the culprit, the fungus *Phytophthora infestans*. De Bary's insight that fungi can cause disease preceded the work of the French chemist Louis Pasteur and the German bacteriologist Robert Koch. In 1874 a farmer in Japan proposed that a species of leafhopper transmits a pathogen to rice, causing Rice Stunt Disease. The insight that insects can harbor pathogens preceded the discoveries that malaria and yellow fever are mosquito-borne diseases.

In California, a world away from the potato fields of Ireland and the rice paddies of Japan, farmers battled a different problem. The cottony cushion scale is an insect that damaged citrus so that fruit was unsuitable for sale. Rather than spray groves with insecticides, entomologists at the U.S. Department of Agriculture searched the world for an insect that would prey on the scale, finding the Vandalia Beetle in New Zealand. Its release in 1888 in California's citrus groves diminished the population of the scale and the losses it caused.

To spread scientific knowledge to farmers, Denmark in the 1880s began dispatching scientists to the countryside. England created the Advisory Service in 1912, and the United States founded the Cooperative Extension Service in 1913. In the short term the application of science to agriculture restored fertility to soils and kept insects and pathogens in check. Over the long term agricultural science spread hybrid corn around the globe and fueled the Green Revolution. The application of science to agriculture has averted a Malthusian crisis by expanding the food supply apace of population increase.

■ Introduction: The Energy Revolution

The first and second Industrial Revolutions of the period 1750–1914 depended upon an accompanying Energy Revolution. The world was gradually transformed from animal and wind power to a new age of hydropower, steam, coal, electricity, and petroleum. In terms of hydropower, the early nineteenth century witnessed the construction of a vast network of canals. Further, water-powered mills of all types, particularly for the manufacture of textiles, flourished during the First Industrial Revolution. Likewise, water-powered gas compressors (trompes) produced compressed air for a variety of needs, including blast iron furnaces. In France and Switzerland, where water was abundant, hydropower was a major source of energy. The Frenchmen Jean-Victor Poncelet (1788–1867) and Benoît Fourneyron (1802–1867) were important contributors to the science of hydraulics. Poncelet's undershot waterwheel of the 1820s, with curved blades and an angled sluice gate, was the most efficient of his day, and Fourneyron's invention of a water turbine was the first of its kind. By 1837 an improved Fourneyron turbine, a mere 1 foot (30.5 centimeters) in diameter, spun 2,300 times per minute and produced 60 horsepower.

The nineteenth century became the age of steam. Steam engines revolutionized manufacturing, steam-operated printing presses led to greater literacy, and railroads, steamships, and steamboats altered transportation and communication in profound ways. Steam engines designed by Thomas Savery (ca. 1650–1715), Thomas Newcomen (1663–1729), James Watt (1736–1819), Matthew Boulton (1728–1809), and others ushered in the new era. To fuel the engines, coal became the preferred energy source. By the early twentieth century the United States, Britain, and Germany led the world in coal production. Coal-fired factories and mills meant that manufacturing could locate in areas far removed from sources of water power. Coal gas illuminated cities, and coal began to be used to power steam turbines to produce electricity.

Innovations in electromagnetism by Christian Oersted (1777–1851) and Michael Faraday

(1791–1857) led to developments in electricity by Thomas Edison (1847–1931), Nikola Tesla (1856–1934), Joseph Swan (1828–1914), and Werner von Siemens (1816–1892). Individuals such as Samuel Insull (1869–1938) and companies such as General Electric and Westinghouse democratized electricity by making it available to a wide range of consumers. The marvels of electricity were celebrated at world's fairs everywhere. Steam turbines powered by coal, petroleum, and natural gas produced electricity worldwide. Water power, through a series of innovations in turbines such as by the Holyoke Water-Power Company in Massachusetts, was harnessed for hydroelectricity.

The use of petroleum as an energy source burgeoned in the twentieth century. The late nineteenth century had witnessed the introduction of kerosene lamps as well as the world's first oil well. The Nobel and Rothschild families, along with companies such as Standard Oil, the Royal Dutch Company, Shell Transport and Trading Company, and the Anglo-Persian Oil Company, developed multinational corporations for the drilling and refining of petroleum. The invention of internal combustion and diesel engines enabled oil to fuel ships, locomotives, trucks, automobiles, motorcycles, and airplanes. The twentieth century's mobility was clearly tied to petroleum, an observation underscored by Henry Ford's introduction of a moving assembly line in 1914 to manufacture his Model T automobiles.

—Paul Tenkotte

Advances in Waterpower

Waterpower is significant for its versatility in initially providing mechanical advantage and then for generating electricity. Waterwheels have been used to grind corn and grind grain into flour since antiquity. Watermills were built alongside rivers with a large wheel comprised of blades sitting partly submerged. This design was called the undershot waterwheel. As the wheel turned from the flow of the water, mechanical advantage obtained from spinning gears moved stones that did the grinding.

Early waterwheel designs. (By Jeff Dixon after an illustration by Robert Karl Koslowsky)

The first undershot wheel was described by the great Roman engineer Vitruvius 2,000 years ago after people observed that a river current would turn a partially submerged wheel when paddles were affixed to its perimeter. From here, introduction of the more efficient overshot wheel dominated waterpower installations in England and France up until the nineteenth century. In this configuration, water is directed over a flume, falling into buckets mounted on the circumference of the wheel's rim. The water's weight and its small drop from the flume provided the force to rotate the wheel. Typically these wheels rotated a few revolutions per minute. The greater efficiency (65 percent vs. 25 percent) of the overshot wheel gives it the ability to produce more

power. It too gained widespread acceptance in Europe and America, where sites were plentiful for capturing elevated flows of channeled water in millraces.

As trade increased and businesses expanded during the Middle Ages, industry gravitated around factories built near sources of flowing water. The Industrial Revolution, which began with water-powered textile mills, owes much of its success to John Smeaton (1724–1792), Britain's "father of civil engineering," who built massive waterwheels constructed of cast-iron. Besides grinding grains, waterwheels found a number of uses in crop irrigation, supplying drinking water to communities, and driving the sawmills, forge bellows, pumps, looms, and trip and tilt hammers of industry.

Waterpower played an important role in America's early development. Although the steam engine was fully developed in the 1800s, coal was scarce and wood unsatisfactory as a fuel in the expanding United States. Rotating waterwheels powered the nation's first industrial cities—the textile mills operating in Pennsylvania, New York, and New England—until the opening of canals brought cheap coal to the steam-powered mills of the Midwest in the mid-nineteenth century. In contrast, during this period waterpower prevailed at the Mississippi River fall line at Saint Anthony Falls, enabling Minneapolis to emerge as a grain-milling center. This set the stage for Minneapolis to later adopt hydroelectric power and become the leading U.S. producer of flour up until 1930. In other cases, waterpower took priority over transportation, and dams superseded canals. The Embrey Dam built in 1855 near Fredericksburg, Virginia, was constructed to turn waterwheels and produce mechanical power to drive machinery. The Fredericksburg Water Power Company sold lots along the canal system and rented waterpower privileges calculated by horsepower. The wooden crib dam was eventually replaced by a concrete one in August 1909 and produced about 8,000 horsepower of hydroelectric power for the community. The dam remained in operation until the early 1960s, when the last electric generating plant on the canal system was closed. Both the Minneapolis and Fredericksburg examples reflect the advance of

THE PELTON WATER WHEEL

During the California gold rush, Lester Pelton, a young mining engineer, invented a waterwheel that took on his name and can be considered an early form of turbine. Up until this point, waterwheels had been used on larger rivers to power mills of various types. They did not perform as well in the faster-moving mountain streams and waterfalls where mining operations took place. Pelton's newer water turbine worked better. It was an impulse turbine featuring high-speed jets of water striking cups mounted along the wheel's perimeter. These water jets forced the turbine to spin rapidly and operate at high efficiency.

The ensuing practice of hydraulic mining became dominant as a result of technological advances such as Pelton's wheel. However, mining operations caused rivers in California's Central Valley to become clogged with sediment. This was the state's first major environmental catastrophe and led in 1884 to the Sawyer Decision that effectively ended hydraulic mining. The ruling stopped the destructive practice of dumping mining wastes, including poisons such as mercury, into California rivers.

Pelton's device, which generated twice the power as other waterwheels, won a competition in 1883 for the most efficient water wheel turbine. Pelton established the Pelton Water Wheel Company, which sold the product the world over. Ultimately, large power utilities using abun-

Patent for Lester Pelton's water wheel, 1880. (U.S. Patent Office)

dant fossil fuels to generate electricity displaced the waterwheel, and Pelton went out of business in 1954.

—Robert Koslowsky

waterpower, from mechanical waterwheels to electrical generation, as technological innovation raised the amount of power that could be generated through gains in efficiency.

Waterwheels had limitations. Many applications used elaborate systems of ropes or belts to transfer the mechanical power of the spinning wheels to numerous machines and tasks. Generally, these large wheels were most inefficient compared to water turbines. Furthermore, low water flows during the summer and fall months, coupled with water freezing during the winter months, made the availability of steady power output unreliable. As coal became the fuel of choice, steam-produced power took hold, even surpassing hydroelectric power generation in

many countries, including the United States. Consequently, waterwheels were abandoned as sources of both mechanical energy and alternating current, which demanded at least 1,800 rotations per minute, and water turbines became the hydropower source of choice in the early twentieth century.

James Watt and the Steam Engine

James Watt was born on January 19, 1736, in Greenock, Scotland, the fourth of five children. His father, James Watt Sr., was a carpenter, instrument maker, and merchant. The younger Watt spent most of his teenage years studying mathematics and working in his father's shop, learning metalworking, woodworking, and instrument making. Although he never completed a brief apprenticeship he began with an instrument maker in London, when Watt moved to Glasgow, Scotland, where friends found him a position as an instrument maker for

the University of Glasgow, which was exempt from guild restrictions. While at the university, he made friends with faculty members John Robison, a mathematician and physicist, and Joseph Black, a chemist, who introduced him to the technology of steam engines and helped him with scientific issues through much of his career.

In order to understand Watt's contributions, it is necessary to know what a steam engine is. A steam engine boils water to make steam, injects the steam into a cylinder to move a piston back and forth, and connects the piston to another machine that needs power, such as a pump, a textile machine, a mill, or a conveyor belt. The components of the engine are a boiler, a cylinder containing the piston, a condenser to turn the steam back into water, and levers, wheels, and beams to connect the piston to the machinery. In early steam engines, the piston was moved by condensing the steam directly in the cylinder to create a vacuum that pulled the piston down. In modern steam engines, high-pressure steam is alternately injected into each side of the piston in the cylinder, which produces more power without having to create a vacuum in the cylinder or provide a condenser. Watt was the link between the early and the modern engines.

The first steam engines were designed by Thomas Savery (c. 1650–1715) late in the seventeenth century, and were improved by Thomas Newcomen (1664–1729) early in the eighteenth century. Used for pumping water out of coal mines, they proved to be awkward and unreliable machines. They did, however, demonstrate the potential of steam as a source of power.

Watt made his first improvement to the steam engine in 1765 while working at the University of Glasgow. Using the Newcomen engine as a model, he removed the condensing step from the cylinder with the piston and put the condenser in a separate chamber, which made the steam engine much more powerful and reliable. Another of his inventions alternately injected steam into each side of the piston so that it was powered in both directions. This almost doubled the power produced. Those two developments revolutionized the steam engine.

Illustration of James Watt's condensing steam engine. Watt was not the first to develop the steam engine, but his innovations almost doubled the steam engine's power and improved its reliability. (Library of Congress)

In 1766 Watt resigned from the university and started an engineering company to concentrate on research for the steam engine. In 1769 he filed a patent on the separate condenser and brought in a partner, John Roebuck (1718–1794), to manufacture the condensers and other products he invented. During that period Watt invented other ways to improve the steam engine's efficiency, including a governor to control the engine's speed, an indicator to show the steam pressure, and novel ways to convert the motion of the piston to drive different types of machines.

After Roebuck withdrew his backing, another investor, Matthew Boulton (1728–1809), bought out Roebuck's share of the partnership. Watt moved to Birmingham, England, where Boulton was located, in 1775. They built a new factory in the Soho district to build steam engines. The resulting company, called the Boulton & Watt Company, became an immensely successful business that manufactured steam engines to provide power for many industries. During the next 25 years, the partners sold more than 500 engines.

Watt and Boulton's partnership lasted until 1800, when they transferred their shares of the business to their sons, James and Matthew, respectively, and both of the older men retired. Although Watt did not invent or manufacture steam engines for such movable uses as locomotives, the technology he developed for his stationary engines was crucial to the nineteenth-century development of steam engines for tractors, trains, and ships.

In 1785 Watt was elected to Britain's prestigious Royal Society of London, an organization dedicated to scientific inquiry. In 1806 he was awarded an honorary doctorate from the University of Glasgow. The British government also offered him the title of baronet, but he graciously declined. Watt died on August 25, 1819, in Heathfield, England. In later years, a unit of electrical power was named the watt in his honor.

Coal Production and Its Uses

Although coal has been mined for millennia, extraction was traditionally carried out on or near the surface of the earth on a small scale, using relatively primitive techniques. This changed during the late eighteenth and nineteenth centuries as a result of the Industrial Revolution, which began in Great Britain and later spread to continental Europe, the United States, Japan, and other parts of the world. Coal was the fuel of industrialization, and it was this increase in demand that spurred innovation. Yet the history of coal mining during this period was also marked by the physical dangers and exploitation of labor characteristic of industrialization.

By the 1700s, overharvesting had made wood—the traditional fuel source for both household and commercial use—a scarce commodity in Britain. Imported wood from New England, Sweden, and Russia was prohibitively expensive, but coal was cheap, plentiful, and close at hand. Coal also proved to be a much more efficient fuel; wood is only about 53 percent combustible carbon, while bituminous (soft) coal is 88 percent carbon, and anthracite (hard) coal is 94 percent carbon. The process of coking, in which coal is heated in airless ovens at high temperatures to drive out water, coal tar, and coal gas, increased its energy output even more.

In Britain, rich coal deposits were located in Scotland, northern England, the Midlands, and South Wales. Before the development of an effective canal system, however, it was difficult and expensive to transport the coal to other regions. As a result, industry and mining communities grew up around the coal beds, dramatically shifting the nation's demographics. This trend would be repeated around the world as new coal deposits were discovered and tapped. In 1700 Britain mined approximately 2.6 million short tons (that is, the U.S. ton of 2,000 pounds) of coal annually. By 1800 production

had quadrupled to 10 million short tons, and by the turn of the twentieth century that number had skyrocketed to 236 million short tons.

As with other aspects of the Industrial Revolution, the coal industry developed somewhat later in other parts of the world. But by 1850, anthracite coal had replaced wood as the fuel of choice for heating in cities in the United States. Lucrative coal industries developed in a number of states, particularly Pennsylvania, West Virginia, Illinois, and Ohio. In Germany large-scale commercial mining began earlier, in the mid-eighteenth century, spreading to the Ruhr region by 1815. The first permanent mine in Poland was established at Szczakowa in 1767. In the early 1800s, large coal deposits were discovered in New South Wales, in Australia, and near the Meuse River in Belgium. Countries like France that could not mine enough coal domestically to meet their needs imported it from other coal-rich nations. By the early 1900s, the world's top three coal producers, as shown in annual figures, were the United States (350.8 million short tons annually), Britain (236.1 million short tons), and Germany (121.3 million short tons). The largest non-Western coal producers included Japan (10.1 million short tons) and the Transvaal (2.4 million short tons).

Coal had a number of uses in rapidly industrializing societies. Commercially, dirty but cheap bituminous coal could be used to power formerly water-dependent mills and factories, meaning that these no longer had to be located near rivers or other bodies of water. Coal-fired steam engines on steamships and locomotives increased and cheapened transportation options for both individuals and businesses. Coal also provided the high heat necessary to separate metals from their ores, allowing for large-scale production of iron and steel. In the household, clean-burning anthracite coal could be used for lighting, heating, and cooking. In 1792 Scottish engineer and inventor William Murdoch (1754–1839; his name also appears as Murdock) developed a method for purifying and storing the gaseous mixture of hydrogen and methane given off during the coking process. Known as coal gas or town gas, this by-product was soon the ubiquitous fuel source in urban households, piped in by utility companies. Beginning in the

late 1800s, coal was also used to generate electricity for residences and businesses.

As the demand for coal increased, easily accessible deposits were soon exhausted, forcing miners to dig deeper into the earth. Adit mines, horizontal shafts dug into hillsides, soon gave way to bell pits, which consisted of a vertical shaft that was enlarged into a bell-shaped chamber at the coal seam. These in turn gave way to deep-shaft mines by the end of the eighteenth century. These mines utilized a long vertical shaft that extended for hundreds or even thousands of feet into the earth before branching off into horizontal tunnels along the coal seam.

The deeper miners dug, the more problems they encountered. Bell pits, for instance, were known as “suicide pits” because the unsupported rock overhanging the bell chamber was prone to collapse. Flooding during heavy rains could also lead to collapses. As workers moved farther and farther from the surface, ventilation became an issue. Dust explosions, however, were the most pressing concern. Deep mines often contained pockets of firedamp—flammable gasses such as methane and carbon monoxide—that could easily ignite the highly combustible coal dust suspended in the air. Stray sparks or even friction were enough to trigger a massive explosion. Europe's deadliest coal mine disaster took place at the Courrières Mine in northern France on March 10, 1906, when a coal dust explosion killed 1,099 workers. The October 14, 1913, Senghenydd Colliery Disaster—Britain's worst coal mine disaster—resulted in 439 deaths. On October 22 of that same year, the United States experienced its most serious explosion when 263 miners were killed at Stag Canon No. 2 in Dawson, New Mexico. Around the world, thousands of miners died each year from explosions, cave-ins, asphyxiation, and mining-related injuries and illnesses.

Primitive early solutions for combating these problems often created new problems. To meet the need for fresh air deep in the mines, for example, miners would set fires at the base of the vertical shaft. While the heat from the fire would suck fresh air into the mine, it was also apt to ignite pockets of firedamp. Series of trapdoors that could be opened and closed to circulate air were also utilized, but their

➤ CANARY IN A COAL MINE

As methods for extracting coal became more advanced and mine shafts grew deeper, workers were increasingly at risk of coming into contact with pockets of methane, carbon monoxide, and other toxic gasses. These could cause asphyxiation or could ignite coal dust suspended in the air, triggering a massive explosion. Because these gasses are colorless and odorless, it was difficult to detect their presence until it was too late.

To solve this problem, miners began bringing caged male canaries with them into the mines. Canaries are particularly sensitive to gas levels, and even a small amount of methane or carbon monoxide is fatal. The birds thus acted as an early-warning system for the miners. If the canary stopped singing (male canaries are renowned for singing almost constantly), was seen swaying unsteadily on its perch, or was found dead on the bottom of its cage, it was a clear indication that the levels of toxic gasses were rising. Miners

would then evacuate and wait for the gasses to dissipate.

Canaries were not the only animals used in this manner; workers also brought caged mice into the mines. Mice, however, were not as useful. They were less susceptible to the effects of methane and carbon monoxide and did not display as many symptoms of gas poisoning as did canaries. Without the benefit of a canary's bright yellow color and easily audible singing, mice had to be more closely observed to notice their reactions to changes in air quality.

Although this low-tech solution was eventually replaced by more sophisticated methods of gas detection, the use of canaries in coal mines persisted well into the twentieth century. In fact, canaries were not phased out of British coal mines until 1987. Today, the expression "canary in a coal mine" is used to describe something that acts as an advance warning of impending crisis or catastrophe.

—Maxine Taylor

effectiveness was limited. Later innovations, however, proved more beneficial. Wooden pit props, used to support mine ceilings and shore up shaft walls, were introduced in 1800. In 1807 John Buddle (1773–1843) developed an air pump that achieved better air circulation, and British chemist Sir Humphrey Davy (1778–1829) introduced a safety lamp in 1815 that provided light but, thanks to a mesh of metal gauze, would not trigger an explosion.

In addition to being hazardous, mining during this period was also profoundly exploitative. As with factory work, the demand for labor was high, wages were low, hours were long, and working conditions were poor. Children as young as five years old were employed as trap-door operators in 12-hour shifts, while slightly older girls and boys and even pregnant women were used to transport heavy loads of coal out of the mine. In Britain, Scottish coal miners were enslaved to their employers until the passage of the 1775 *Colliers and Salters Act*.

The first major piece of mining reform legislation, the *Mines Act of 1842*, was passed by Parliament after a Royal Commission created by

Lord Shafesbury (1801–1885) brought to light many of the industry's abuses. It forbade women of all ages and boys under age 10 from working underground. A law passed in 1860 raised the minimum age to 12, and another in 1872 required mine managers to be properly trained and certified. In 1908 the workday in British mines was shortened to eight hours.

In the United States, coal miners' strikes, led by labor unions such as the National Federation of Miners and Mine Laborers (NFMML), the Industrial Workers of the World (IWW), and the United Mine Workers (UMW), were the main vehicle for labor reform during the late nineteenth and early twentieth centuries. The UMW, founded in January 1890 and led by John L. Lewis, orchestrated the failed Bituminous Coal Miners' Strike of 1894 and the more successful Coal Strike of 1902. Although unions were eventually able to win concessions for better pay, shorter hours, and safer working conditions from industry management, strikes sometimes ended in violence. In the September 10, 1897, Lattimer Massacre, for instance, 19 immigrant mine workers were killed by local authorities during a strike

in Hazleton, Pennsylvania. Similarly, during the Ludlow Massacre of April 20, 1914, Colorado National Guardsmen shot 19 striking miners.

Physically dangerous and socially fraught though it was, coal mining has remained an economic mainstay of industrial, and even postindustrial, nations.

Harnessing Electricity in the United States

After the development of the battery in 1800, a reliable source of direct current electricity was available. Hans Christian Oersted (1777–1851) demonstrated in 1819 that a magnetic field operates around the flow of current, while Michael Faraday (1791–1867) showed in 1831 how current flowing in one wire electromagnetically induces current in another wire. These discoveries allowed scientists in England and Germany to prove in the 1840s that electric circuits adhere to the law of conservation of energy. Fifty years later, current flowing through wires was put to commercial use to illuminate residences and businesses.

Experimenters first used battery-produced direct current to develop communication systems such as the telegraph and telephone based on its steady low-current output. Inventors such as Thomas Edison (1847–1931) developed higher direct current systems for commercial lighting.

Dynamos, or electric generators, were concurrently developed to produce electric energy, and methods of transmission were established to deliver this energy to the point of consumption.

In 1879 Edison introduced direct current electric light by improving generators, establishing wiring for power distribution, and developing the first electric meter for recording customer consumption. With this comprehensive approach he determined how much to charge customers for electric service. Electrical distribution was becoming big business. Nikola Tesla (1856–1943), Edison's employee, understood the pitfalls of direct current transmission and fought to introduce an alternating current approach in which electrical power could be transmitted over hundreds of miles. In addition to lighting, alternating current could also be used for powering residential appliances and industrial machinery.

Tesla ultimately defected from Edison's employ to pursue his vision that commercial electrical systems should be based on alternating current, which has the advantage of being easily stepped up to a higher voltage or stepped down to a lower voltage with coils of wire or transformers. This enabled networks of electrical systems to be established across many states, provinces, and countries during the early twentieth century. Tesla believed that his cost-effective alternating current motor would liberate many laborers from the toil of thousands and thousands of hours of manual labor. In some ways Tesla was the forerunner of the democratization of energy, just as Henry Ford was for transportation.

The Tesla phase of electrical innovation gave rise to alternating current, which changes its direction of flow for a defined number of times per second. Electric power found in American homes today experiences 60 reversal cycles every second. Electrical applications proliferate not only in residences but also in the industrial, transportation, and lighting sectors. In fact, alternating current can produce direct current for those devices that operate better without voltage variations. Furthermore, to overcome the mass of electric batteries needed for power, the electric motor and generator were perfected for

their continuous operation. Since direct current motors are easier to run at a variety of speeds, they are commonly found on subway and light-rail systems.

Electric power can be sent more economically and efficiently over long distances in the form of higher-voltage alternating current. Consequently, power companies use alternating current motors. The ability to transmit electricity over great distances ended the need to locate power plants close to where products were produced. Industries were liberated from the proximity of their prime movers—wood, coal, petroleum, and flowing water—and could therefore attract a better workforce. This aspect of power generation spelled the end of the era of the waterwheels used to generate power locally.

Samuel Insull (1859–1938) made the widespread integration of America’s electrical infrastructure possible. Originally one of Edison’s managers, Insull became an advocate for Tesla’s method of alternating current production and distribution after Insull moved to Chicago and established his own electric utility company, Commonwealth Edison, in 1907. Insull leveraged economies of scale to overcome market barriers by cheaply producing electricity with large steam turbines. This technology, coupled with an innovative two-tier billing scheme, made it easier to put electricity into American homes. Insull drove demand for electricity by charging for the user’s share of peak demand at one rate and for kilowatts used during off-peak hours at another rate. Incentives were employed to encourage and promote load management to ensure a high level of continuous consumption to match the turbines’ steady generating power. His legacy was the democratization of electricity in America during the early twentieth century.

Harnessing electricity requires a prime mover, such as water or steam turbines, that in turn drives an electric generator. Water turbines are used in hydroelectric plants or tidal generating stations. Steam turbines are utilized when a heat source can effectively boil water to produce steam. Up until the start of World War I, wood, coal, petroleum, and natural gas all were used to create steam for the turbines.

THE AMERICAN THIRST FOR ENERGY

America thrives on energy, a need that was satisfied by the abundance of wood from colonial times through the latter half of the nineteenth century. Wood’s primary uses were for cooking and heating, with the day being governed by the rising and setting of the sun. Coal then emerged as the dominant source of energy until the start of the First World War. The concurrent widespread use of shipping and railway networks allowed coal from Virginia and Ohio to be delivered to most of the American population. Coal was the only prime mover that could be produced in quantity to satisfy demand for energy.

Coal accounted for more than 70 percent of energy production by 1899 and was used to propel locomotives and drive steam turbines for electricity. One billion metric tons of coal were produced at the start of the twentieth century, while only 100 million barrels of petroleum were consumed. Coal became synonymous with electric power production for the next three decades until a diversity of prime movers moderated coal’s influence.

Hydroelectric, petroleum, and natural gas were also employed to produce electricity for America’s burgeoning energy demand. Electricity became the currency of energy exchange and was the solution to the relative immobility of large generating plants needed to deliver energy. People demanded more material goods, better communication, more public transportation, and even more light. Electricity proved to be the answer. The physical energy derived from heat and water when converted into electricity to do work freed humanity and beasts of burden from using their muscle power. This availability of electricity, coupled with electric light, extended the length of a day for work and social activities alike. Life had finally become independent of the rising and setting of the sun.

—Robert Koslowsky

Cost-effective generation of Tesla’s alternating current electricity and Edison’s electric light bulb changed the quality of life for millions of Americans. Inexpensive and safe light, brought to the home as alternating current, replaced unsafe flame from candles and noxious fumes from gas. Home construction costs plummeted with

lower ceilings, since no extra vertical headroom was needed to collect and vent gas. Corporations formed to both drive and serve the demand for increasing consumption of electricity. Westinghouse, founded in 1886, and General Electric, founded in 1892, focused primarily on the kitchen. Both promoted convenience through ceiling fans (1882), desk fans (1886), coffee-pots (1891), electric stoves (1893), and toasters (1909), to name a few. Convenience bolstered consumption, and these corporations thrived by serving the customer. Today, electric energy is found almost everywhere. Its ease of production, distribution, and consumption led to the rise of the twentieth-century electronics industry and the proliferation of electrical devices taken for granted in the twenty-first century.

Petroleum and the Petroleum Industry

Petroleum is a complex hydrocarbon, which when distilled (boiling and condensation) and refined (treatment to remove impurities and odors) yields a variety of products. At the light end are gases such as butane, in the middle are fuels such as gasoline and diesel, and at the bottom are heavier products such as lubricating oils and asphalt.

Uses of petroleum products as a source of illumination, medicines, wall coating, pitch, and fire weapons can be traced back to antiquity, but only in the nineteenth century did they begin to play a major economic role. By 1850 a small industry had developed in eastern Europe based on the mining of oil (through a

process similar to coal mining) and distilling it into kerosene. Burned in the newly developed Vienna lamp, kerosene gave off a bright flame, produced little smoke or odor, and was fairly stable. In comparison to the most prized illuminant of the day, whale oil, kerosene was considerably less expensive. At about the same time, Abraham Genser, a Canadian, and Samuel Downer, an American, developed the technology to distill kerosene from coal or bitumen. Both organized American firms to begin large-scale kerosene production in the mid-1850s. Also in the mid-1850s, a group of Connecticut promoters led by George H. Bissell and James M. Townsend hit upon the idea of drilling for oil using a process similar to that used in drilling for salt and then refining the crude oil into kerosene. They dispatched “Colonel” Edwin L. Drake to drill for crude oil in Titusville, Pennsylvania, where he and his crew struck oil in 1859, pioneering the world’s first oil well.

Drake’s well set off an oil boom. Petroleum-based kerosene was quickly embraced as an illuminant across the United States and Europe. Existing alcohol-distilling and coal-oil refining technologies were easily transferable to oil refining, making it easy to increase production. Oil refiners were also able to sell through existing marketing networks for coal and other oils. Furthermore, kerosene’s usefulness in lights and lanterns, its price, and the public’s familiarity with the basic technology of coal oil and whale oil lamps contributed to the quick shift to petroleum-based kerosene. Despite these advantages, petroleum had drawbacks. Crude oil is a fairly volatile liquid, with light elements such as butane vaporizing and producing explosive gases. Many refined products such as gasoline are highly flammable. Explosions and fires plagued the industry at every stage, from drilling to end use.

Nonetheless, the price and performance of American petroleum created demand far beyond the United States, and American refiners began exporting their products in 1861. By 1865 exports outpaced domestic consumption, and refined oil, mostly kerosene, outpaced crude exports. By 1866 refined oil made up 84 percent of the nearly 1.7 million barrels of petroleum products sold abroad. It was the country’s leading

manufactured export. Although most of the oil exports went to Europe, Asia and South America also were important markets.

Several individuals played key roles in petroleum's development as an energy source. One of the most important was a Cleveland merchant, John D. Rockefeller (1839–1937), who transformed a \$4,000 investment in an oil refinery in 1863 into the world's first great oil company, Standard Oil (founded in 1870). Central to this success was Rockefeller's understanding of cost control and of economies of scale: as the volume of the crude oil refined increased, the cost per refined oil barrel fell. This combined with Rockefeller's ruthless competitiveness made Standard the dominant force in the industry's first decades. His early success also was based on continual reinvestment to expand refinery capacity and reduce refining costs. Rockefeller also integrated vertically (outside of oil refining) into transportation, packaging, and marketing to reduce those costs. In addition, Standard was quick to adopt innovations such as the newly developed tank rail car to haul oil from fields to refineries. Through horizontal integration, Rockefeller joined Standard with oil refiners. By 1873 Standard Oil was the world's largest oil refiner, controlling 40 percent of the industry's capacity. By the time the Standard Oil Trust was formed in 1882 the company was a virtual monopoly, with control of 90 percent of the U.S. refining capacity and major oil pipeline and rail freight firms.

The petroleum industry quickly expanded from its U.S. roots. The introduction of modern oil drilling, refining, and marketing techniques to Russia by the Swedish Nobel and French Rothschild families in the 1870s broke Standard's and Pennsylvania's monopoly on the world's supply of crude and refined oil. The Nobels and Rothschilds followed the Rockefeller model, but they tended to be more innovative than Standard, developing new refining and shipping technologies. By 1890 these American and European firms had become true multinational companies that explored, drilled, refined, and sold crude and refined products around the world.

In the 1890s these firms were joined by new competitors. The Royal Dutch Company of the

THE PROFESSOR'S PROPHECY

In 1855, rock oil promoters George H. Bissell and James Townshend asked noted Yale University chemist and mineralogist Benjamin Silliman Jr. to analyze a petroleum sample from northwestern Pennsylvania. Silliman concluded his analysis with the observation that “it appears to me that there is much ground for encouragement in the belief that your Company have [*sic*] in their possession a raw material from which, by simple and not expensive process, they may manufacture very valuable products. . . . [N]early the *whole* of the product may be manufactured without waste, and this by . . . one of the most simple of all chemical processes.” Bissell, Townshend, and Silliman had discovered the value of petroleum. John D. Rockefeller doubtless would have agreed. In 1913 his petroleum-based fortune peaked at \$900 million, making him one of the world's richest men.

Benjamin Silliman Jr. to George H. Bissell and others, New Haven, April 16, 1855, in *The Early and Later History of Petroleum* . . . , ed. J. T. Henry (Philadelphia: J. B. Rodgers, 1873), 53–54.

Netherlands (founded in 1890) exploited new oil finds in the Dutch East Indies, while the Shell Transport and Trading Company of Britain began producing oil in the Dutch Borneo in 1895. They were followed by oil discoveries in Persia (today Iran) by the Anglo-Persian Oil Company (British) in 1908. These and other firms continued to expand the petroleum industry through the discovery and development of new fields. The British London and Pacific Company, organized in 1889, tapped oil fields in Peru. A major American development was the discovery of oil in Texas, starting with the Spindletop field in 1901. Production in Mexico followed when U.S. oil interests under Edward L. Doheny drilled successful wells there in 1906.

Petroleum's dominance in lighting declined at the end of the nineteenth century with the

invention of the electric lightbulb by Thomas Edison. With improvements in engine design and the development of internal combustion engines, however, petroleum found new uses as a fuel.

Since heavier grades of refined oils were cheaper, cleaner, and easier to handle than coal, they were used as fuel for railroad locomotives and ship engines at the end of the nineteenth century. These trends were accelerated by the development of an efficient diesel engine in 1897. More important was the adoption of gasoline as the fuel for automobiles and airplanes. American Henry Ford's development of mass production with the Model T in 1908 created widespread demand for gasoline and lubricating oils.

■ Introduction: The Industrial Revolution in the West

The era of the Industrial Revolution in the West, conventionally dated from 1750 to 1914, can be divided into three stages: protoindustrialization, the Early Industrial Revolution (sometimes called the First Industrial Revolution), and the Second Industrial Revolution. These stages occurred at varying times in nations and regions, depending on a host of social, cultural, political, and economic factors. In some places the process of change was more gradual, while in others it was more rapid. Generally, the three stages are differentiated by specific indicators. Protoindustrialization is marked by what is variously termed cottage industry, the domestic system, or the putting-out system (in which raw materials are “put out” to “cottagers” in private homes for completion as semifinished or finished goods). An example was the woolen textile industry, in which merchants contracted with cottagers to spin wool into yarn and weave yarn into cloth. In contrast, the First Industrial Revolution was characterized by the first factories powered by water and, increasingly, steam. Other key developments were more efficient steam engines, the increased use of coal as an energy source, and new methods for producing iron, which along with textiles was the most im-

portant product of the First Industrial Revolution. The Second Industrial Revolution, usually associated with the mid to late nineteenth century, was distinguished from the two earlier stages by further technological innovation: new methods for the production of steel, developments in the field of industrial chemistry, the full development of the railroad industry, the use of electric power, and new communication technologies such as the telegraph and radio. While the First Industrial Revolution was centered on iron and textile production using steam power, the Second Industrial Revolution revolved around steel, railroads, electricity, and chemicals. Another characteristic of the Second Industrial Revolution involved changes in the nature of production, with the large conglomerates replacing the small family-owned firms of earlier decades.

The roots of the Industrial Revolution in the West are generally associated with Great Britain in the mid to late eighteenth century. There, supplies of coal, iron, and labor, coupled with a stable government, a vast colonial empire, and solid transportation network of roads and canals, set the stage for industrial growth. The First Industrial Revolution was also closely

tied to other related movements, including enclosure (the privatization of common land), the agricultural revolution of the early to late eighteenth century, and the commercial revolution. The commercial revolution made London, Liverpool, and other port cities centers of foreign trade and helped make London a powerhouse in investment banking. Contemporaneous to the First Industrial Revolution, Britain increasingly adopted the policy of free trade as spelled out in Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* (1776) and as represented by the repeal of the Corn Laws in 1846. The First Industrial Revolution is also remembered for its inventions, many of which were important to the cotton industry, including the flying shuttle of John Kay, the spinning-jenny of James Hargreaves, the water frame of Richard Arkwright, and the power loom of Edmund Cartwright. The vastly improved steam engines of Matthew Boulton and James Watt, the first iron-hulled ship of John Wilkinson, the first working locomotive of Richard Trevithick, the first public steam railroad (the Stockton and Darlington), and the puddling and rolling process of Henry Cort advanced the transportation and iron industries. The First Industrial Revolution arrived later in continental Europe and in the United States. Nevertheless, by 1860 the United States already ranked second to Great Britain in industrial production.

Henry Bessemer's 1855 British patent of a process to decarbonize liquid steel with blasts of air is perhaps the most famous example of an invention that helped usher in the Second Industrial Revolution of the mid to late nineteenth century and the early twentieth century. Other innovations came from many quarters of the world: the open-hearth furnace of the Siemens and Martin families of Germany and France, respectively; the "basic process" to neutralize phosphorous in iron for steel production of Sidney Thomas and Percy Gilchrist (Britain); the steam turbine of Charles A. Parsons (Britain) and Gustav de Laval (Sweden); the incandescent electric lamp of Joseph Swan (Britain) and Thomas Edison (United States); and the electric streetcar of Werner von Siemens (Germany). Further advances in electricity and chemistry and inventions like the telegraph, the telephone,

the phonograph, the motion picture camera, the internal combustion engine, the all-electric starting motor, and the first manned heavier-than-air flight all stimulated industrial production. The Second Industrial Revolution was also marked by new business and marketing techniques such as vertical integration, horizontal integration, and scientific management.

By the 1880s the United States surpassed Great Britain in industrial production, and in the first decade of the twentieth century Germany, in turn, displaced Britain for second place. By 1914 when Henry Ford of the United States introduced a moving assembly line to manufacture his Model T automobiles, the groundwork had been laid for a profound transformation of industry to be marked thereafter by a steadily increasing division of labor and mass-production techniques.

—Paul Tenkotte

Industrial Organization before the Industrial Revolution

"Protoindustrialization" is the term commonly used to describe industrial organization before the Industrial Revolution. Traditionally marked by "cottage industry" and nonmechanized production, protoindustrialization is generally distinguished from the First or Early Industrial Revolution, which was characterized by mechanization of production within factories powered by waterpower or steam engines. There are several cautionary notes to make, however. In many places, protoindustrialization and industrialization existed side by side. Furthermore, in some areas a de-industrialization stage intervened between protoindustrialization and industrialization. In other areas, a gradual integration of domestic industries into factories occurred. Studies of specific geographic regions have also discovered that the relationship of protoindustrialization to demographic factors such as marriage rates, birthrates, caloric intake, and life expectancy is inconclusive. The variant strands of protoindustrialization have also cast doubt on whether it was a consequence of the decline of manorialism/serfdom or a precipitant to the commercialization of agriculture. Clearly, no single model applies across the board worldwide.

Scholars have long debated the relationship of protoindustrialization to later industrialization, especially whether surplus capital and/or surplus labor of the earlier period fed later development. This viewpoint has led to a parallel search for how protoindustrialization in Europe metamorphosed into rapid industrialization in the nineteenth century, while the same did not occur in China and other places worldwide. More recent historians, in particular Kenneth Pomeranz in *The Great Divergence*, has stood this investigation on its head by shifting the debate from that of a rising Europe and a declining Asia to claiming that both continents were experiencing “ecological bottlenecks” to their growth in terms of “land and energy” in the eighteenth century. Europe’s pursuit of certain solutions (e.g., fossil fuels, intercontinental trade, and an increasing dependence upon colonialism and imperialism) produced a so-called Great Divergence that expressed itself in rapid industrialization in the West during the nineteenth century but not in China.

Skilled artisans in European cities and towns had long produced textiles and other finished goods in their shops. Regulated by guilds, which exercised great political and economic influence, these artisans controlled prices as well as access to their trades. Eventually they met with competition. For example, in medieval Flanders, merchant guild members called drapers began to buy wool that they then sent to rural cottagers to perform specialized tasks, such as spinning the wool into yarn, weaving the yarn into cloth, and cleaning and softening the cloth by fulling. These cottagers were peasant farmers who supplemented their incomes by working in their own homes, principally during the off-seasons that did not require laborious planting and harvesting. They were generally paid by piecework, that is, by a set price per piece. This early phase of industrialization, known variously as a cottage industry, the domestic system, or the putting-out system (because the raw materials were “put out” to the cottagers), became increasingly prevalent in textile and other industries during the eighteenth century as Europe emerged from the crisis of the seventeenth century. In addition, water-powered mills, often

in rural locations, were used for fulling textiles from medieval times throughout the period of protoindustrialization.

As in Europe, Chinese farm families also relied on cottage industries, such as spinning and weaving, to supplement their livelihoods. These subsidiary enterprises, however, differed from the European putting-out system in one substantial way. In Europe, merchants provided the raw material to cottagers to spin and weave, whereas in China, merchants advanced money to farmers, who then purchased their raw materials at nearby markets.

Protoindustrialization lasted longer in central and eastern Europe than in England and northwestern Europe. Disrupted by nearly three centuries of warfare (1618–1914), the German states were politically and economically fragmented up until the late nineteenth century. Industrialization remained subordinate to agriculture, which still employed more than 80 percent of the German population by 1800. Regional agricultural differences likewise complicated matters. West of the Elbe, there were many free farmers; however, east of the Elbe, in Silesia and Saxony, “second serfdom” held sway from the sixteenth century forward. Large landowners controlled the timber forests and, as late as the nineteenth century, the Silesian textile industry.

Industrial organization during protoindustrialization was characterized at first by animate labor in craft industries and the cottage system and by water-powered mills. It gradually evolved into concentrated production in larger factories. Although historians debate the very definition of the term “factory,” with some arguing that it must entail mechanized production, it is clear that by the late eighteenth century in Europe textile and other forms of production were being concentrated under one roof, where laborers could be supervised by an employer. The reasons for this change in organizational structure were many. Some scholars posit that it was more efficient, less susceptible to embezzlement of materials, more flexible to the changing patterns of supply and demand, more profitable for merchants, and more likely to produce better-quality goods. The evolution from craft and cottage production to larger-scale enterprises—whether

you prefer to call them factories or not—was also related to the growing networks of trade worldwide and to the competition that such trade engendered. Regardless, industrial organization was clearly changing in size and scope before the First Industrial Revolution powered its factories by steam machinery.

Great Britain and Its Continental Competitors in the Early Industrial Revolution

The beginnings of the Industrial Revolution in Great Britain can be dated from the 1750s, when the first factories appeared, or from the 1770s, when the rate of technological innovation began to increase. Why these developments occurred first in Great Britain has likely attracted more attention than any other question in the field of economic history. This question is important in its own right but also informs more general discussions of the causes of industrialization or modern economic growth. Yet economic historians are still far from consensus.

Perhaps Britain was just lucky. The prominent British economic historian Nicholas Crafts famously argued that the experience of the British Industrial Revolution hinged on a few key innovations in textile manufacture, and these might have happened anywhere. Most historians

would agree that technological innovation as well as the establishment of factories were key factors in Britain's early industrialization but reject the argument that such changes could just as easily have happened elsewhere. Britain, so it is argued, was unique in one of several respects, and this uniqueness explains Britain's primacy in industrialization. Several key arguments, each open to question, are surveyed here.

Did Britain have an advantage over other European countries in the area of science? British science was not obviously superior to French or German science during this period, but possibly British science was more practically oriented than was continental science. To be sure, there were several British learned societies, especially the Royal Society of London (usually referred to as the Royal Society), in which scientists and practical men interacted. Yet the French Royal Academy of Sciences also evinced an interest in both science and technology. The academy sponsored the publication between 1761 and 1788 of the multivolume *Descriptions des Arts et Métiers* (Descriptions of the Arts and Crafts), which described with written text and illustrations numerous handicraft and manufacturing processes. Moreover, it is unclear that the link between scientific progress and technological innovation was important. The new spinning and weaving machines in textile manufacture required no scientific knowledge, and there is no strong evidence to suggest that James Watt benefited from his knowledge of physics in developing a better steam engine. Even the advances in iron-making largely preceded any comprehension of the scientific principles involved. Still, the very idea of careful experimentation and recording of results may have usefully been transferred from scientists to practical tinkerers.

Separated from the continent by the English Channel and the North Sea, Britain had not faced a military invasion since 1066. This security may have encouraged a slightly greater willingness to make investments in factories or machinery. England also was reasonably flat and well watered, which facilitated the movement of both goods and people, but these natural advantages meant little before the transport improvements of the early eighteenth century. Britain

INDUSTRIAL REVOLUTION IN ENGLAND, CA. 1850

had some advantageous raw materials: coal, iron ore, other metals, and clay for pottery, among others. Yet many areas of the continent had similar resources, and Britain imported all of its cotton and much of its iron ore.

It has been argued that Britain benefited from moving to coal more quickly than other countries. Such a transition, it has been argued, mainly resulted from dwindling wood supplies rather than the falling cost of coal due to technological and transport improvements. Coal could produce higher heat than charcoal, and thus advances in iron-making and steam engines (but not most innovations in textiles) were more likely in a coal-based economy. France, Germany, Belgium, and other European countries also possessed large coalfields and dwindling forests, so the difference between countries is one of degree.

The British system of parliamentary government, dominated by wealthy men of property, may have contributed to industrialization because it resulted in greater confidence in the inviolability of private property and thus greater willingness to invest in factories or technology. Yet as the novels of Charles Dickens and others attest, the ability of the British courts to enforce contracts was limited. The British system of patent protection was likely better than the French custom of royal rewards for innovation but, again, was far from perfect: John Kay, who invented the flying shuttle, and Edmund Cartwright, who developed the mechanized loom, were both ruined by litigation. Britain differed less from the continental countries than is often imagined in terms of regulations prohibiting changes in technology or organization of production but appears to have been far less diligent in enforcing these regulations; this, however, might have been a reaction to rapid change rather than a cause. In terms of taxes, tax rates in Britain were on average double those in France, and this should have discouraged investment.

The British government was more decentralized and less bureaucratic than most European governments. This may have worked against the enforcement of regulations, as localities sought to attract industrial employment. Special

➤ THE FACTORY AND TECHNOLOGICAL INNOVATION

Which came first, the modern factory or modern rates of technological innovation? Surprisingly, the factory came first. In the 1750s British entrepreneurs began to draw workers together under one roof and supervise them in textiles, nail making, and a range of other industries in which workers had previously worked in their homes. The upswing in the rate of technological innovation is generally dated only to the 1770s.

While the first factories used the same technologies employed in cottages, innovators later developed large powered machines suited only to the factory setting. Thereafter, the factory and technological innovation were mutually supportive. The factory allowed entrepreneurs to watch the production process for the first time and thus encouraged innovation. The factory also facilitated the division of labor and thus mechanization. The development of machines suited to the factory environment further enhanced the advantage of the factory.

—Rick Szostak

interests hoping to deter innovation could lobby central governments on the continent but would find such a strategy less helpful in Britain. Decentralization also had an impact on transportation infrastructure: continental countries lavished funds on a few routes from the capital, while locally based turnpike trusts and river improvement and canal corporations created a national network of roads and waterways in Britain.

Britain in the late 1700s possessed the largest overseas empire in the world, especially after Britain's victory over France in the Seven Years' War (1756–1763). Some scholars have argued that profits earned in the empire were invested in industry. Others have countered that profits have been exaggerated and, furthermore, that there was no strong link between merchants and industrialists in terms of finance. Another hypothesis is that Britain benefited from privileged access to raw materials, but it seems that the continental countries could obtain many imported goods at comparable prices. With respect to markets, most industrial goods were consumed

within Britain, though there are exceptions: half of cotton goods were exported, though only a fraction of exports went to the empire.

British society was more meritocratic than continental societies in which titled nobles enjoyed many real and honorific privileges. Still, most successful British business families dissipated some of their wealth in purchasing landed estates and titles. There may nevertheless have been a greater social incentive in Britain to earn money in industry and even to reinvest much of it in industry. With respect to workers, some scholars have suggested that the English system of Poor Laws discouraged not only work effort but also geographical mobility, for the unemployed could be sent back to their home parish. Others have argued conversely that a social safety net may have actually encouraged workers to take a chance on leaving the countryside for jobs in urban industry, especially since industrial parishes rarely expelled poor migrants.

British industries became regionally concentrated during the eighteenth century. The cotton industry was concentrated in Lancashire, wool was concentrated in Yorkshire, various metal trades existed around Birmingham, steel was concentrated in Sheffield, and pottery was concentrated in Staffordshire. Innovators and entrepreneurs could thus learn from each other and could also more readily appreciate the potential advantages of any innovation.

Regional specialization in turn encouraged division of labor. If one worker performed several tasks, any specialized machine would lie idle while other tasks were performed. The possibilities and advantages of mechanization were much clearer if each worker performed one task. As industries became regionally concentrated, specialized machine-making firms emerged to serve these. While specialized machine makers are most often discussed with respect to textiles, it is worth noting that steam engine manufacture after Watt was also a task for such firms. These firms competed on the basis of the quality and effectiveness of their machines and thus had a powerful incentive to innovate.

In the mid-eighteenth century, turnpikes, river improvements, and canals gave Britain by far the best transport system in Europe. As noted

above, this encouraged regional specialization and division of labor. As well, entrepreneurs in many industries moved from personally selling goods at fairs to selling by sample or catalogue and shipping goods by road carrier. This not only freed up entrepreneurial time to devote to production but also created a strong incentive for mechanized factory production of standardized goods. Individual workers in their own homes using general-purpose tools could not produce the sort of standardization that a consumer ordering from a catalogue demanded. Some industries also pursued mechanization in order to respond quickly to changes in fashion. Others were encouraged to innovate in order to incorporate a wider range of raw materials into their product.

The fact that economic historians have not yet agreed on the factor or factors that caused Britain to have the first Industrial Revolution has encouraged some scholars to downplay the uniqueness and significance of the Industrial Revolution. Yet the widespread adoption of the factory and the occurrence of important technological innovations across several industries suggest otherwise. Moreover, from at least 1820 onward, Britain experienced sustained levels of economic growth never previously seen in the world. The search for consensus will thus likely continue, and the factors above will likely remain the focus of debate.

Technology and the Early Industrial Revolution

How widespread was technological innovation in the last half of the eighteenth century, and what were its effects on England's early industrialization? A handful of innovations in textiles, iron manufacture, and steam engines are the best known. James Watt (1736–1819) dramatically increased the efficiency of steam engines in the 1770s and 1780s. John Kay's flying shuttle (1733), James Hargreaves's spinning jenny (1764), Richard Arkwright's water frame (1769), and Samuel Compton's spinning mule (1779) all contributed to increased production of cotton textiles. Henry Cort's puddling and rolling process (1784) used coal rather than charcoal as a fuel in both the furnace and forge and produced cheaper, better, and much more standardized iron sheets than was previously possible. It was no accident that these inventions occurred in England. Watt, Cort, and Arkwright were not isolated geniuses but instead built upon decades of experimentation undertaken by many other British inventors.

Moreover, this handful of major innovations was far from the whole story of innovation in the late eighteenth century. In textiles manufacturing, every stage of production—carding, spinning, weaving, bleaching, dyeing, and printing—witnessed important innovations during the latter half of the eighteenth century. Improved bellows in the iron industry were encouraged by Cort's innovation but also reflected decades of experimentation. The various trades that fashioned iron and other metals into finished goods also were innovative: machines for stamping and pressing metal sheets were invented in the 1760s, and slitting mills and wire works were developed to produce rods of the appropriate size for nail makers and needle

makers, respectively. The development by Benjamin Huntsman (1704–1776) of a technique for producing higher-quality steel in 1751 set the stage for the dramatic growth of the Sheffield steel industry. Methods of digging and draining coal mines were improved, and underground transport of coal advanced dramatically (with technology later adapted for the first railroads). Josiah Wedgwood (1730–1795) and others revolutionized the quality and price of Staffordshire pottery in the second half of the eighteenth century with developments in mixing clay, forming it, and painting it.

Each of these innovations required the effort and energy of many individuals. Watt's steam engine would have been impossible to build before about 1770, when techniques for planing valves to withstand the pressure of steam were developed. Moreover, Watt needed a very tight fit between piston and cylinder. He was ecstatic when John Wilkinson (1728–1808) developed a boring device capable of accuracy to within the width of a penny.

The British Industrial Revolution is celebrated because it led to an increase in the rate of economic growth. From at least 1820 onward, British per capita incomes began to rise by 2 or 3 percent per year. This was fast enough to be noticeable. Moreover, this growth in incomes occurred despite rapid population growth, thus overturning the famous prediction of Thomas Malthus (1766–1834) that poverty could never be erased because population would inevitably grow faster than output.

While economic historians have tended to celebrate the eventual impact of technology on economic growth, they have also recognized that not all workers benefited at the time. Social historians have shown greater concern for the plight of workers replaced by machines and the more general de-skilling of labor that followed from division of labor and mechanization. Workers could no longer take artisanal pride in the finished product. Workers in the early stages of industrialization occasionally protested violently against the introduction of machines. But the children of such workers saw little alternative to factory work.

Textile Manufacturing in Eighteenth-Century England

Textiles—materials made by weaving threads of animal or plant fibers together—are one of the oldest manufactured products, easily predating the rise of civilization. For centuries, both spinning and weaving were tedious and time-consuming, making fabric a relatively expensive commodity. In the late eighteenth and early nineteenth centuries a series of inventions mechanized both trades, profoundly changing the nature of clothing and in the process touching off the Industrial Revolution.

At the dawn of the industrial era, textiles were manufactured using a decentralized method called the putting out system. This involved entrepreneurs who contracted the labor

of spinning and weaving to individuals working at home, periodically picking up the finished product, dropping off more raw materials, and paying for the labor. As such, it was a staple income for many farm families. Early machines were intended to improve production in this traditional cottage industrial system.

Such was the spinning jenny, developed by James Hargreaves in the 1760s and patented in 1770. It mechanized the process of thread (yarn) spinning, which had been the bottleneck in cloth production. The initial model was hand-cranked and allowed the operator to make eight threads where one had been made before. The yarn was of poor quality, though, and there was room for improvement. The next innovation came close on its heels, with the development of the waterframe in 1771 by Richard Arkwright, which produced a stronger and more uniform thread. Thread manufacture was further enhanced with the creation of the spinning mule, a hybrid that in 1775 combined the better features of the waterframe and the jenny. It also proved capable of expansion; by 1790 some mules boasted 400 spindles. Yarn production for the moment vastly outstripped weaving capacity.

Weaving also underwent drastic changes during the eighteenth century. The first step toward mechanization came with the invention of the flying shuttle by John Kay in 1733. Although it sped the weaver and allowed the production of a wider bolt of cloth, true innovation did not come until after thread production outstripped the capacity of existing looms after midcentury. In 1787 Edmund Cartwright introduced the power loom, fully mechanizing the weaving process. It had some initial flaws that were not fully worked out until the 1820s.

During this interim of roughly a generation when spinning had been mechanized and weaving was still working out the bugs of the power loom, the numbers of hand weavers increased drastically. They commanded good wages and bitterly resented the loss of jobs due to the gradual mechanization of their trade as the problems of the power loom were solved. Calling themselves Luddites (after their fictional commander, General Ned Ludd) some of these displaced workers engaged in machine breaking

The spinning jenny was an important invention in the textile industry in that it was the first machine to use multiple spindles simultaneously. It was invented by James Hargreaves in 1764. (Library of Congress)

➤ COTTON VERSUS WOOL

Textile manufacture is generally one of the first sectors to experience factory organization and mechanization as countries develop. Textile technology is relatively simple, and a mass market in textiles exists even in poor countries. During the British Industrial Revolution, it was not the large woolen industry that first innovated but rather the much smaller and newer cotton industry. Cotton fibers appear to have been better suited to mecha-

nization. Cotton textiles were originally more expensive, as raw cotton had to be imported from warmer climes (particularly the U.S. South), but the price of cotton goods fell dramatically due to mechanization and factory production. Cotton textiles were generally easier to clean and more comfortable than woolen textiles and were quickly adopted by farmers and workers.

—Rick Szostak

and terroristic attacks on mill owners and managers. Their efforts did not stem the tide of industrialization.

The industrialization of textile manufacturing saw the birth of the modern factory system. The early hand-operated machines were superseded by larger models that required more than muscle power and were more expensive than a small weaver could afford. Entrepreneurs set a new pattern in which they centralized the means of production under one roof; instead of bringing the work to the laborer, they forced the laborer to come to the work. Water power replaced muscle power, dictating that the facilities be located on rivers at the fall line. These new factories offered the owners and managers a greater degree of control over the workforce and a consequent increase in productivity. The adoption of steam power further increased productivity and was not affected by drought or cold.

Working conditions in these new factories were brutal, and living conditions in the new towns that grew up around them were squalid. There was a surplus of labor at the turn of the nineteenth century as agriculture became less labor-intensive. Employers thus could and did offer low wages and demand long hours from the workforce, forcing them into a subsistence economy. The housing provided for them was crowded and unsanitary. These conditions prompted attempts to organize labor and government efforts to regulate industry, both with varying degrees of success but with the cumulative effect of gradually bettering the lot of the working classes.

Early Industrial Revolution in Continental Europe

The early Industrial Revolution (sometimes called the first Industrial Revolution) occurred slightly after and somewhat contemporary to the agricultural revolution of the early-to-late eighteenth century. By the late eighteenth century, the early Industrial Revolution was well under way in England and in parts of continental Europe; however, it should be noted that it was not a unipolar event experienced simultaneously by multiple regions. Rather, the transition from an agriculturally based economy to a more mechanized industrial and urban one was gradual, uneven, and multifaceted. Furthermore, the early Industrial Revolution was dependent upon a whole range of political, cultural, and social conditions that differed from place to place, further affecting its appearance, relative strength, and growth.

Skilled artisans in European cities and towns had long produced textiles and other finished goods in their shops. Regulated by guilds, which exercised great political and economic influence,

these artisans controlled prices as well as access to their trades. Eventually they met with competition. For example, in medieval Flanders, merchant guild members called drapers began to buy wool that they then sent to rural cottagers to perform specialized tasks, such as spinning the wool into yarn, weaving the yarn into cloth, and cleaning and softening the cloth by fulling. These cottagers were peasant farmers who supplemented their incomes by working in their own homes, principally during the off-seasons that did not require planting and harvesting. They were generally paid by piecework, that is, by a set price per piece. This early phase of industrialization, known variously as protoindustrialization, cottage industry, the domestic system, or the putting-out system (because the raw materials were “put out” to the cottagers), became increasingly prevalent in textile and other industries during the eighteenth century as Europe emerged from the “crisis of the seventeenth century.”

Protoindustrialization, marked by cottage industry, is distinguished from the first or early Industrial Revolution, which was characterized by mechanization of production within factories powered by water and steam. By the late eighteenth century, England was the leader of the early Industrial Revolution, based on its deposits of raw materials such as coal and iron ore and its colonial empire, stable government, and network of canals and roads. Nevertheless, France was close behind, as were pockets of the German states, Switzerland, northern Italy, Flanders, Spain, and Austria.

The early Industrial Revolution was based on the steam engine and the production of coal and iron. The steam engine gradually made water-powered mills outdated, as steam-operated machinery powered factories where groups of employees worked on specialized tasks. Likewise, the steam engine changed the course of transportation in its application to steamboats, steamships, and steam railroads. Steam-operated pumps drained coal mines. Reciprocally, coal typically powered steam engines. Indeed, European coal reserves were essential to this early period of industrialization, as Europe’s forests were being depleted for fuel and building materials. Even iron smelting (removing iron from its ore

through intense heating) had long relied upon charcoal, a by-product of charred wood. In the early Industrial Revolution coke, a waste product of coal, was instead used to fire iron furnaces. Iron, of course, was utilized in the manufacture of machinery, tools, locomotives, and ships. Improved transportation featuring railroads and steamships, in turn, enabled the transfer of coal and finished products, spurring international trade as well as emigration from Europe.

Each of the nations of continental Europe had political, cultural, and social conditions that either impaired or propelled the early Industrial Revolution. France remained largely agricultural, a consequence of the strengthening of the rural peasant class during the French Revolution and thereafter. France benefited, however, from a core of highly trained artisans who concentrated on the manufacture of luxury goods that became known worldwide for their quality. Napoleon’s Continental System attempted to close continental Europe to British imports, contributing to a temporary acceleration in continental industrialization. His defeat, however, removed this blockade and flooded the continent with inexpensive British goods. Further, Britain clearly ruled the seas as well as overseas trade after the wars. Indeed, France had already suffered great colonial losses at the end of the earlier Seven Years’ War (1763). Finally, France had less developed transportation links than industrializing Britain. In the mid-nineteenth century, the French government sought to reverse this condition as it undertook state-sponsored railroad construction that, in turn, began to foster a national market and industrialization.

The German states were politically and economically fragmented until the late nineteenth century. The resultant proliferation of customs duties hampered trade. Prussia, in alliance with other states, reformed the system somewhat in 1834 when it created a unified customs trading zone called the Zollverein. Nevertheless, industrialization remained subordinate to agriculture, which still employed more than 80 percent of the German population in 1800. Regional agricultural differences likewise complicated matters. West of the Elbe, there were many free farmers; however, east of the Elbe, in Silesia

and Saxony, “second serfdom” held sway from the sixteenth century on. Large landowners controlled the timber forests and, as late as the nineteenth century, the Silesian textile industry. Nonetheless, pockets of industrial centers existed throughout the German states, including the coal-and-iron-rich Ruhr and Rhine valleys. Arriving late to industrialization did prove beneficial in some ways, however, as Germany relied upon Britain for imports of machinery, including railroad equipment. Like France, Germany undertook a massive and largely government-financed railroad-building era in the mid-nineteenth century.

Other European regions experienced the Early Industrial Revolution. Switzerland’s industrial capacities concentrated on clock making as well as cotton and silk textiles. Northern Italy was known for its silk mills, Lombardy for its cotton industry, Biella for its woolens, and Tuscany for its straw hats. Flanders gained an early advantage in the production of textiles, exporting some 195,000 pieces annually by 1780–1785 to the New World via Spain. The nineteenth century, however, witnessed increasing competition for Flanders and smaller profit margins. In Spain, the region of Catalonia became noted for its textile manufacturing. By the 1780s in fact, Barcelona had the largest European concentration of cotton operations, totaling more than 100. In Austria, Empress Maria Theresa (r. 1740–1780) initiated the Haugwitz Reforms, freeing export industries from the intervention of local officials. The Habsburg lands of the Stryian countryside engaged in iron production, Lower Austria engaged in cotton textiles, the Alpine areas engaged in iron production, and Bohemia engaged in cotton and wool textiles and glass-making. In addition, Bohemia had rich coal deposits. Suffering an economic depression after the Napoleonic Wars, the Habsburg realms gradually revived, and in 1851 the empire established a customs union over all its territory.

The Early Industrial Revolution eventually evolved into a Second Industrial Revolution of the mid-to-late nineteenth century, of which steel, electricity, oil, chemicals, and an increasing division of labor became the hallmarks.

The Second Industrial Revolution in Europe and the United States, 1850–1914

The term “second Industrial Revolution” is often used to refer to a series of technological and organizational changes that transformed industrial activity in Europe and the United States from approximately 1850 to 1914. These innovations changed the scope and nature of manufacturing and also produced significant changes in Western societies and in the relationship between the West and other parts of the world. Among these changes were the rise of new industries, often based on the use of scientific principles and methods to discover or develop new products; the growth of enormous industrial concerns organized as joint-stock companies; the development of associations such as cartels and trusts

to control prices or output; the emergence of modern forms of advertising and marketing that, along with other developments, promoted the growth of new white-collar occupations; and increased economic interdependence between Europe and other parts of the world, with the latter increasingly subordinated both economically and politically to the former.

As in the first Industrial Revolution, a significant change associated with the second industrial revolution was the development of new technologies. Steel, for example, had been too expensive for mass use before the 1850s. However, the invention of the Bessemer converter in the 1850s and the Siemens-Martin open hearth furnace in the 1870s made the production of high-quality steel much cheaper and led to an enormous growth in steel output. As cheap, abundant steel became available it was used to make stronger, lighter, and more efficient machinery and larger and stronger buildings, ships, bridges, and other structures. The Eiffel Tower, erected in Paris in 1889, was a symbol of the widespread adoption of steel for new uses. Steel also facilitated the expansion of railroads throughout the world. Steel was used not only for rails but also for locomotives, rolling stock, bridges, repair yards, and auxiliary facilities. In turn, railroads helped create larger and more unified markets and lower costs for raw materials and finished goods.

The second Industrial Revolution also saw the creation of a number of new industries. The potential economic importance of electricity had been suspected since the start of the nineteenth century, following Michael Faraday's invention of a rudimentary electric motor and dynamo in the 1820s and 1830s. However, it was not until the 1860s and 1870s that the means for transmitting and converting electricity into light, heat, and power at the receiving end were developed through the inventions of Nikola Tesla (1856–1943) and Thomas Edison (1847–1931). Moreover, Edison and his counterpart in Germany, Werner von Siemens (1816–1892), combined inventiveness with entrepreneurial spirit and organizational talents to create large firms that propelled the growth of electrical networks. By the early 1900s electricity was being used to light businesses and homes, power machines in factories, and run streetcars.

Another new industry was the chemical industry, which expanded dramatically after 1850. German chemists and engineers were responsible for breakthroughs in areas such as dyestuffs, pharmaceuticals, photochemicals, fertilizers, and synthetics. By 1914 Germans dominated world chemical markets, thanks to a combination of systematic research and development, efficient productive organization, and aggressive marketing.

Germans also laid the foundation of the automobile industry. In the 1880s and 1890s Gottfried Daimler (1834–1900) and Carl Benz (1844–1929), working independently of each other, built practical internal combustion engines using a gasoline and air mixture. Although subsequently many individuals made technical improvements and additions, including pneumatic tires, the radiator, the steering wheel, and so forth, Henry Ford (1862–1947) made the automobile widely available through mass production. Ford combined interchangeable parts and continuous flow production, both of which had evolved previously in the production of firearms, harvesters, typewriters, sewing machines, and bicycles, to create that prototypical symbol of modern industry, the assembly line.

Mass production made an increasing stream of affordable goods available to consumers. Thus, while the first industrial revolution had done little to raise per capita living standards, the second industrial revolution spread the benefits of industrialization to broad segments of the European and North American populations and raised the overall standard of living. Indeed, more and more firms established specialized sales and marketing departments with networks of agents, dealers, franchisees, and retailers to promote their products. These salesmen and accountants swelled the ranks of the white-collar workforce that grew alongside the industrial working class.

Another feature of the second Industrial Revolution was the growth of new forms of business organization. Because many of the new industries required enormous amounts of capital, most of them became limited liability joint-stock companies from which stock was bought not only by individual investors but also by banks and other companies. To protect these huge

investments and ensure profitability, owners and managers bought up subsidiary suppliers, which created large vertically integrated firms that controlled everything from raw materials to finished products. In addition, they also frequently entered into formal and informal agreements with similar companies, creating gigantic horizontally integrated enterprises that sought to limit competition or divide up markets.

The era from the 1880s to World War I was the golden age of trusts and cartels such as Krupp, U.S. Steel, General Electric, Siemens, Bayer, Ford Motors, and Standard Oil. Scholars sometimes describe this as an era of organized capitalism to distinguish it from the more competitive laissez-faire capitalism of the early 1800s. As the names listed above indicate, this trend was particularly pronounced in the United States and Germany, whose industries challenged and often surpassed those of England. For example, while England's share of global industrial output fell from 32 percent to 14 percent between 1870 and 1913, Germany's output rose from 13 percent to 16 percent, and that of the United States jumped from 23 percent to 36 percent.

The second Industrial Revolution reinforced the dominance of the West in the global economy. Not only did the new military, transportation, communication, and medical technologies make it easier and cheaper for European states and, to a lesser degree, the United States to colonize other parts of the world, but the very nature of industrial development made colonization seem more necessary to many Western leaders. While Europe and America had been largely self-sufficient in raw materials during the first industrial revolution, many of the new industries relied heavily on raw materials from other parts of the world, especially tropical and subtropical regions. This perceived need to ensure access to imported goods led Europeans, especially the British, to invest huge amounts of capital overseas from 1870 to 1914. It also frequently contributed to a heightened desire among Europeans to physically occupy and colonize overseas territories.

Industrialization in Russia

The industrialization of Russia between 1750 and 1914 took place in two phases. In the first, from 1750 to 1860, industrial growth was slow but relatively steady, while in the second, from 1860 to World War I, industrialization accelerated and showed significant innovation.

The beginnings of Russian industrialization can be traced back to the reign of the Westernizing tsar Peter the Great (r. 1682–1725), who had made economic development a key part of his plan to modernize Russia and elevate it to the status of a great power. Peter promoted the development of mining, metallurgy, and textiles primarily to meet the needs of his revamped army and the new Russian navy. Although most of his successors through Catherine the Great were more interested in Western fashions and culture than in technology or business organization, the need to maintain Russian military power led them to continue government support for heavy industry, especially mining and metallurgy. Much of the increased production was located in the Urals and western Siberia, whose mineral wealth was becoming increasingly evident as Russian migration to the region continued. By 1800, Russia was the leading producer of finished iron in the world, just ahead of Great Britain. However, Russia's primacy was short-lived. By 1820, the British, using new technologies and methods of production, surpassed the Russians, and by 1860 as the Industrial Revolution spread, a half dozen other states had done the same.

While mining and metallurgy stagnated in the early 1800s, the number, size, and output of textile factories increased steadily, and by 1860

cotton textiles were the most dynamic sector of the Russian economy. A considerable part of this increase was due to the gradual mechanization of production in the 1830s and 1840s, including the use of steam power in some of the larger enterprises. Sugar refining, especially in Ukraine, was another industry where production rose significantly as a result of technological and organizational innovation.

Under Peter, most industrial enterprises had been owned and operated by the state. Over the course of the eighteenth century, many of these operations were sold or given over to private industrialists, most of whom were nobles, since only they (as owners of serfs) had a ready supply of labor. However, in the late 1700s and early 1800s nonnobles were able to acquire or establish factories as well, using privately owned serfs or state peasants who had received permission from their landlords to hire themselves out for wages. The reliance of all industrial employers on serf labor in one form or another was a distinctive feature of early Russian industrialization and contributed, at least in part, to its unevenness.

Industrialization was also handicapped by the relative scarcity of capital and Russia's inadequate transportation system. Prior to the late 1800s, most capital came from domestic sources. Direct government investment was extremely important in the early 1700s, but after 1750 industrial enterprises were increasingly financed by private capital, especially with the growth of privately owned banks during the reign of Catherine the Great. Although the government under Catherine and Alexander I made some effort to improve both road and canal networks, these were not enough to overcome the huge distances separating the country's major economic regions. Likewise, before 1850 railroads were too few to have a significant economic impact. While a short line was built between St. Petersburg and the imperial residence at Tsarskoe Selo in 1836, a commercial rail link between St. Petersburg and Moscow was not constructed until 1851.

Russia's defeat in the Crimean War (1854–1856) led both the government and also much of the educated public to recognize the importance of industrialization. Alexander II (1855–1881)

was instrumental in laying the groundwork for industrialization by emancipating the serfs to create a somewhat freer labor force and by creating a more rational legal and administrative system conducive to commercial and manufacturing activity. However, the greatest industrial progress occurred during the reigns of Alexander III and Nicholas II between 1881 and 1914. The Ministry of Finance played a crucial role in this process. Under the leadership of men such as Nikolai Bunge and Sergei Witte, who served as finance ministers during 1881–1886 and 1892–1903, respectively, the Finance Ministry adopted a coordinated approach to industrial growth that centered on railroad construction that was financed through extensive foreign investment, large-scale grain exports, and protective tariffs. While the government invested directly in railroads, it also granted generous subsidies to private entrepreneurs in industries such as metalworking and machine building, which provided goods to the railroads. The results were dramatic. Over 45,000 miles (72,420 kilometers) of track were constructed between 1859 and 1914, with the Trans-Siberian railroad alone covering nearly 4,000 miles (6,500 kilometers). Unfortunately, there were few improvements in other means of transport. The country's canal and road networks were largely neglected during the railroad boom.

Among other industries, the cotton industry continued to perform the best, helping make Russia the world's fourth-largest producer of cotton goods in 1910. While some industries flourished and others lagged, overall annual industrial growth averaged about 6 percent a year, with major new centers of production arising in the Ukraine and the Transcaucasia region (although Moscow and St. Petersburg remained the most important industrial regions). For the expanding industrial workforce, which numbered almost 4 million by 1914, working and living conditions were extremely harsh, and all forms of labor organization were forbidden. Moreover, the policy of financing industry through massive grain exports and high taxes aggravated the economic hardships of the peasantry, contributing to the revolutionary crises of 1905 and 1917.

Industrialization in the United States

From the eighteenth century through the early 1900s, the United States passed through several stages of industrialization. As part of Britain's colonial empire, the 13 colonies were subject to Britain's policy of mercantilism. The colonies did, however, embark upon a period of proto-industrialization in colonial times during which merchants utilized the labor of farmers in their "cottages" to manufacture textiles and other goods. Called a cottage industry or the putting-out system (because the raw materials were "put out" to cottagers), this economy evolved into the early (or first) Industrial Revolution in the early to mid-nineteenth century and into the second Industrial Revolution in the late nineteenth and early twentieth centuries. By 1860 the United States ranked second to Britain in industrial production in the world, and by the early 1880s the United States surpassed Great Britain.

During the colonial period, the 13 colonies were expected to fulfill two important economic roles: (1) as a supplier of raw materials to Britain, especially timber, cotton, grain, tobacco, rice, and indigo; and (2) as a market for finished British goods. In mercantilist fashion, Parliament passed a number of navigation acts that regulated international trade. For example, all export and import goods had to be carried in English or colonial ships, manned by crews composed of three-quarters Englishmen (including

colonial Americans). Furthermore, nearly all imports from continental Europe to the colonies had to pass through England first, where they were taxed. Some colonial exports from America had to be shipped to Britain before being sent elsewhere, including tobacco. Finally, Parliament forbade the colonists from building certain industrial enterprises, especially those related to iron production, as this would compete directly with England. For a time, the British government did not rigorously enforce many of these regulations but left the colonies to what has been termed "salutary neglect." Following Britain's victory in the French and Indian War (the Seven Years' War) in 1763, however, the situation changed. Facing the need to finance a large standing army to protect their vast territorial gains in North America, the British passed legislation to raise colonial taxes. These taxes and stricter enforcement of the Navigation Acts increasingly fettered the colonies economically and helped to lead to revolution.

During the American Revolution, infant American industry experienced growth. The revolutionary army depended on these industries and protected them, as in the case of General George Washington wintering at Valley Forge, the location of important iron-making facilities. After the Revolution, American industry failed to grow at the pace of its British counterpart. Unlike Britain, which had a plentiful labor supply and a compact nation with well-developed transportation links, the United States had plenty of land available for agriculture and hence few laborers for industrial purposes. Furthermore, transportation was difficult. Alexander Hamilton, secretary of the treasury under President Washington, encouraged manufacturing, but the results were limited. American industry benefited again during the Napoleonic Wars, especially following President Thomas Jefferson's Embargo Act of 1807. Francis Cabot Lowell, for example, opened a large cotton factory in Massachusetts in 1813. Employing farm girls, he built dormitories to house them and provided them with good wages. Following the cessation of the wars in 1815, however, international trade resumed, and the British dumped finished goods onto the American market, often below prices charged

in Britain itself. Foreign competition and the disagreement between northern merchants and southern planters on the issue of tariffs created an economic climate not conducive to industrial growth. By 1820, for instance, the city of New York counted only 35 companies employing ten or more workers.

Gradually the construction of important transportation links transformed the United States into a fertile field for the growth of manufactures. These included the National Road from Cumberland, Maryland, to Wheeling, Virginia (now West Virginia; 1818), and the 363-mile (584-kilometer) Erie Canal (1825) between Albany and Buffalo, New York. By 1840 the nation had 3,326 miles (5,353 kilometers) of canals. The first steamboat (*New Orleans*) appeared on the Ohio and Mississippi rivers in 1811, and the first railroad (the Baltimore and Ohio) opened in 1828. By 1860 there were 30,626 miles (49,288 kilometers) of railroads in the United States, increasing to 93,262 miles (150,091 kilometers) by 1880. In 1861 the first transcontinental telegraph began operation, followed by the first transatlantic telegraph in 1866 and the first transcontinental railroad in 1869. Immigrants to the United States, largely drawn by the promise of economic opportunity, flooded into the nation from the 1840s onward, especially Irish and Germans. By 1855 more than 60 percent of the employees of the Lowell cotton mills were Irish.

With plentiful supplies of coal, copper, cotton, grain, iron, livestock, and oil, industry in the United States grew rapidly during the second half of the nineteenth century. Cities like Birmingham, Cleveland, Buffalo, and Pittsburgh became centers of steel production; Cincinnati and Chicago became centers of meatpacking; and Milwaukee became a center of brewing. Buffalo, Chicago, Cleveland, Erie, Milwaukee, and Toledo benefited as ports along the Great Lakes. Detroit became home to the nascent automotive industry.

American technology also contributed to industrialization. The U.S. Patent Office granted 31,000 patents in the period 1790–1860 and 1.5 million from 1860 to 1930. Eli Whitney's cotton gin (1793), although important, paled in comparison to his perfection of the use of interchangeable parts for manufacturing. Called the "American system," the use of interchangeable

parts was applied to clock making by Eli and Seth Thomas, to gun making by Samuel Colt, and in nearly every other conceivable industry. American inventiveness expressed itself in the steel plow, the safety pin, the air brake, the telephone, the incandescent electric lightbulb, the sewing machine with a lockstitch design, the cash register, the phonograph, the film camera, the motion picture camera, the all-electric starting motor, and the first manned heavier-than-air flight.

The United States also proved innovative in new business and marketing techniques, especially during the Gilded Age of the late nineteenth century. Andrew Carnegie pioneered in vertical integration of business from raw materials to manufacturing to transportation. John D. Rockefeller perfected horizontal integration, forming trusts and holding companies. Bankers like J. P. Morgan financed railroads and corporations like General Electric and U.S. Steel. Frederick Winslow Taylor's scientific management theories led to greater efficiencies in factories, and Henry Ford introduced a moving assembly line in 1914 for the manufacture of his Model T automobile.

While industrialization in the United States produced a number of negative effects, which populists, progressives, and labor unions opposed, it nevertheless transformed the nation from an agricultural base to an urban industrial one. By 1914 the U.S. economy had grown to twice the size of Great Britain's.

The Organization of Industry— Division of Labor, the Factory, and Interchangeable Parts

Three transformations—the division of labor, factories, and interchangeable parts—were closely related and together transformed the nature of industrial production. In 1750, most industrial work was still performed in the home or in workshops, where artisans produced finished goods in their entirety. Each item crafted was necessarily unique in some respects, for the worker never quite wielded hammer or chisel in precisely the same way. By 1900 industrial production in Britain, the United States, and other industrialized or industrializing nations was concentrated in factories. Workers tended to perform only a single task in the production process. Output was highly standardized, so that a part from one product could generally replace the same part from an identical product with little difficulty.

The division of labor came first. Indeed, a degree of division of labor occurred even among hunters and gatherers. The maker of the spear was not necessarily the thrower of the spear, and the hunter was usually not the cook. Yet through most of human history men and women had to learn to perform a variety of tasks in order to obtain their subsistence. As the industrial sector grew, it became possible for artisans to specialize in particular stages in production.

In 1776 Adam Smith, often hailed as the founder of modern economics, already appreciated that the degree of division of labor was limited by the size of the market. As he noted in *The Wealth of Nations*, if one pin maker fulfilled the entire local market for pins, there was little scope for division of labor. If the market grew, then it became possible for different pin makers to specialize in different tasks. One worker could stretch the wire, and another could cut it the desired length; still others could fashion the head. Smith rejoiced in the cost savings: workers needed only to master one task, could perform a task for which they were particularly well suited, and need not move from one workstation to another or set down one tool to pick up another. In addition, the flow of materials from one worker to another encouraged a steady work effort. Smith mentioned but likely underestimated a further advantage of division of

labor: it both encouraged and allowed the mechanization of individual tasks.

While the increasing division of labor encouraged the move to factories, it did not require this. For centuries, yarn had moved from cottage-based spinner to weaver. In at least one English village, workers built two-way cupboards between their row houses to facilitate the movement of unfinished goods from one workstation to the next. Indeed, the development of complex linkages between cottage workers, often organized by a “putting-out” entrepreneur, is often termed “proto-industrialization.”

Still, the division of labor presented challenges. There was, most obviously, the physical cost of moving goods from cottage to cottage. There was also a monitoring problem: if an entrepreneur delivered raw materials to one worker and picked up finished goods from another several steps down a chain of production, it was difficult to attach any defects in quality to a particular worker. In a long chain of production, there was also the risk that one worker through sickness or malfeasance would fail to do his or her work, and others would be forced into idleness. In a factory setting where workers were gathered under one roof and supervised, such a worker could more easily be disciplined or replaced.

By gathering workers together and supervising them, as occurred in many British industries from the 1750s onward, factory masters encouraged further division of labor. It might not have made sense to carry an intermediate good to a different cottage for the performance of one hammer blow, but it might make sense to have a factory worker hit thousands of pieces in the same way each day. Moreover, the entrepreneur watching such a worker might wonder if he or she could be replaced with a machine.

With the division of labor, different (sets of) workers often produced different parts. Whereas a skilled artisan might build different parts of a gun so that they fit well together, parts emanating from different workers tended to need a great deal of filing in order to fit. Careful supervision within the factory could achieve a better fit. Still, the same parts produced by different workers tended to be far from identical.

The ideal of interchangeable parts, where one gun barrel would fit as well as the next,

would only be achieved with mechanization. As noted above, both the division of labor and the factory encouraged mechanization. Lathes, stamping machines, and milling machines were developed in the early nineteenth century, often in American armories, and this allowed the manufacture of fairly standard parts. As a result, the process of fitting different parts together became much easier. These machines thus provided one of the preconditions necessary for the development of the assembly line.

These specialized machines naturally provided a further reinforcement of factories and division of labor. They were generally only feasible in a factory setting. And a different worker tended each machine. Notably, these workers usually needed few skills. Machines and unskilled laborers thus replaced the skilled artisan, though skilled labor was still necessary for the design and construction of these machines.

Scientific Management

The goal of scientific management was to arrange factory layouts and simplify each worker's task to promote increased industrial productivity. Popularized by Frederick W. Taylor, scientific management was also known as Taylorism, and it stimulated considerable change in both manufacturing techniques and labor utilization in the early twentieth century.

As the nineteenth century drew to a close, many American industrial enterprises were consolidating into larger and larger units. Plant managers and foremen operating in behemoth

factories faced unprecedented problems in organizing production flow and motivating workers. While many changes developed through natural evolution, a few visionaries believed that the same sort of scientific and technical thinking that helped foster these industrial giants could be applied to the task of making them more efficient.

The leading exponent of this scientific management approach was Frederick W. Taylor. As a teenager, he had worked as an apprentice pattern maker at the Enterprise Hydraulic Works in Philadelphia. Pattern making required very precise drafting and modeling skills, both of which matched Taylor's talents. When he moved on to the Midvale Tool Co. he became intrigued with improving the performance of tool steel implements.

In the early 1880s he began using a stopwatch to evaluate workers' behaviors. Much of his subsequent work was in line with that of a developing group of professionals who used time and motion studies to increase worker productivity. Indeed, Taylor collaborated closely with two of the most well-known time-and-motion experts of the time, Frank B. Gilbreth Sr. and Lillian Moller Gilbreth. This couple put their professional skills into practice in raising a family of 12 children. Two of their children, Ernestine Gilbreth Carey and Frank B. Gilbreth Jr., co-wrote the book *Cheaper by the Dozen* which became a best-seller and was made into a popular film.

Taylor was an outspoken advocate of a piecework wage system to encourage individual workers. His goal was to break each job into small steps, simplifying the task and eliminating wasted motions. This process also encouraged hiring unskilled workers as opposed to skilled craftsmen. He conducted "scientific" studies to determine an optimum output for each job and then proposed higher pay scales for those workers who exceeded these quotas on a daily basis. Not surprisingly, many workers found these quotas difficult to maintain and resented being reduced to "cogs in the machinery."

Managing the activities of individual workers required new supervisory skills as well. Taylor pioneered the concept of functional foremen whose duties, like those of the workers they managed, were also simplified and focused. Specialists like speed bosses, quality inspectors, and other narrowly focused functionaries replaced

the highly skilled generalists who had previously overseen factory operations.

On a broader level, reorganizing the flow of work on a factory floor was also seen as an essential factor in increasing productivity. To meet Taylor's quotas, workers had to have ready and continuing access to the tools, parts, and supplies needed for each task. While Taylor had no direct role in the factory-wide moving assembly line that Henry Ford and his colleagues established in 1913, the new system exploited many principles of Taylorism.

Scientific management became very popular with industrialists and plant managers. It even won some support among the Progressives, a political movement that lauded the participation of experts in government. At the same time, Taylorism roused strenuous opposition from labor organizers who ran the gamut from the highly skilled craft-union spokesmen of the American Federation of Labor to the committed socialists of the International Workers of the World.

Although Taylor died in 1915, the concepts and techniques he advocated continued to win converts. The remarkable increase in workers' productivity that helped fuel the bull market of the 1920s stemmed in large measure from the application of scientific management principles. Industrialists around the world adopted Taylorism to increase their factory efficiency as well. All modern manufacturing enterprises contain some elements of the scientific management doctrine.

Fordism

Named after Henry Ford (1863–1947), Fordism refers to the method of industrial management characterized by the mass production of inexpensive,

uniform products, the use of interchangeable parts and the assembly-line in production, the gaining of employee loyalty through wages, and management hostility to unionism and employee participation in the decision-making process. Fordism, which revolutionized the production and purchase of automobiles, led the way to mass production of more goods, and, as a consequence, helped usher in the modern age.

The first automakers had envisioned the car as a luxury item for the wealthy few, but Henry Ford priced automobiles within the means of large numbers of Americans in order to profit from a higher volume of sales despite a narrower margin. To meet demand, Ford automated and accelerated production, reducing the control that workers had over the pace of work. In 1908 Ford introduced the Model T at \$850; by 1914 it sold for only \$490. Ford achieved this savings by making every phase of production efficient. Somewhat apocryphally, to indicate this focus on thrift, Ford is quoted as saying that consumers could choose a Model T in any color as long as they wanted black. (The original Model T was actually available in several colors, and the "black only" policy was not introduced until 1914.)

Ford's obsession with efficiency and cost transformed working conditions throughout industry. In 1910 Ford began manufacturing the Model T in a single factory in Highland Park, Michigan, and in 1913 he began building cars on the assembly line. Rather than move workers from place to place, as had been the usual case in manufacturing, Ford moved partially built automobiles to the workers—this was a process first pioneered in the meatpacking industry's "disassembly lines." Workers performed a small number of tasks that they endlessly repeated during the course of their working lives. Efficiency increased: whereas a single worker needed twenty minutes to build a magneto (electric generator), a group of workers, each doing one task, could produce a magneto every five minutes. Wherever possible, Ford mechanized production, and in doing so transformed workers from craftsmen into machine operators. As a result, the assembly line set the pace of work.

The assembly line never slowed down, and it offered workers only fifteen minutes for lunch and use of the bathroom. The assembly line's demands wore workers down. Labor turnover was

➤ FORD AS PHILOSOPHER

Ford's great success in revolutionizing daily life and production made him a hero to many and the subject of many interviews in which he was treated as an authority on all things. The following excerpt shows the somewhat tortured way in which he defends the impact of mass production on workers:

"It has been asserted that machine production kills the creative ability of the craftsman. This is not true. The machine demands that man be its master; it compels mastery more than the old methods did. The number of skilled craftsmen in proportion to the working population has greatly increased under the conditions brought about by the machine. They get better wages and more leisure in which to exercise their creative faculties."

so high that in 1913 Ford hired 52,000 workers just to staff his factory with 13,600 workers. Automakers and other businesses that employed factory workers favored workers in their twenties and early thirties. Employers were less eager to hire assembly line workers in their forties. As their productive abilities decreased they became less valuable to an employer and once laid off they had trouble finding new jobs. In contrast, skilled workers, automobile painters for example, had greater job security and longevity.

To create a stable labor force amid turnover, Ford hired Americans that other employers shunned: blacks, Latinos, ex-convicts, and the moderately disabled. In contrast to other manufacturers, who paid a subsistence wage, Ford raised wages to \$5 a day, double the prevailing rate; he also reduced the workday from nine to eight hours in 1914. Workers still had to toil six months before being eligible for \$5 a day, and even then this pay was not guaranteed. Ford established a "sociology department" in his plant to monitor worker behavior and to enforce his ideal of clean living at home as well as at work. Only workers who lived up to the values of hard work, self-reliance, and thriftiness that Henry Ford had prized since childhood earned \$5 a day.

By increasing production and raising wages, Fordism made America prosperous during the 1920s. Over the long term mass production techniques spread from the making of cars to other industries, while the mass-produced automobile became a transformative technology.

■ Introduction: Industrialization in Africa, Asia, and Latin America

Industrialization in Africa, Asia, and Latin America during the nineteenth and early twentieth centuries lagged behind that of Britain, continental Europe, and the United States. Nevertheless, at least before the Napoleonic Wars these continents retained, more or less, a level of

competitiveness in what still remained a largely preindustrial economic order. Cottage industries such as spinning and weaving flourished worldwide. The American historian Kenneth Pomeranz has demonstrated, for example, in his book *The Great Divergence* that both Europe and China

were experiencing ecological bottlenecks to their growth, in terms of “land and energy,” in the eighteenth century. Europe’s pursuit of certain solutions (e.g., fossil fuels, intercontinental trade, and an increasing dependence upon colonialism and imperialism) produced a so-called Great Divergence that expressed itself in rapid industrialization in the West during the nineteenth century but not in China.

Great Britain, home of the First Industrial Revolution, developed textile machinery that reduced the price of cotton yarn from 38 shillings per pound in 1792 to 5.5 shillings in 1812. After the Napoleonic Wars, Britain marketed its inexpensive manufactured goods, especially textiles, globally. Facing competition from abroad, the handicraft industries of many regions suffered a decline. Latin American nations experienced independence following the Napoleonic Wars, offering a hope that they might escape the mercantilistic shackles of Spain. To the contrary, however, the young Latin American republics found it difficult to compete with inexpensive British goods, lacked financial capital of their own to develop industries, and, suffering from political instability, failed to attract sufficient foreign capital. As a result, Latin America entered an era of neocolonialism in which it became an exporter of food and industrial raw materials and an importer of European manufactured goods and capital. Likewise, neocolonialism thrust much of Africa and Asia in 1914 into roles deeply dependent upon foreign investment and global trade, furnishing raw materials for factories in more developed nations. One of the great exceptions to this pattern, of course, was the rapid industrialization of Japan during the Meiji period.

General patterns of textile production, closely tied to international competition, can be traced in India, the Ottoman empire, and Persia. For centuries, family laborers and artisans had produced textiles in these areas. After the Napoleonic Wars, British machine-manufactured textiles provided a lower-cost alternative. The results were twofold. First, the rest of the world began buying British textiles, contributing to a decrease in the export (and hence production) of textiles from India, the Ottoman empire, and Persia. Second, British textiles began to compete with domestic markets in those empires,

albeit more gradually, as the infiltration of interior markets required the construction of better transportation routes. At the same time, political developments in these regions compounded economic pressures. Regional warfare accompanied the spread of British authority in India, the Ottoman empire was losing territory, and Persia was recovering from a series of unsuccessful wars with Russia. Despite such challenges, all three areas were able to at least somewhat reverse their downward trend by the late nineteenth century. Indian and Ottoman textile manufacturers began buying inexpensive British yarn to weave in their own factories into finished textiles. In addition, some foreign investors began to establish textile mills in these countries, employing native workers. Finally, native manufacturers began to focus on special niche markets. These included labor-intensive industries such as carpet making in the Ottoman empire and Persia. Some native businessmen, such as the Tata family from western India, used textile manufacturing to generate other more diversified industries.

Industrialization in Africa, Asia, and Latin America often depended upon foreign investment. In particular, European merchants gained concessions to build and operate railroads, factories, and mines in all of these regions. In China, the race among European powers for concessions led to extraterritoriality and to other limitations of Chinese sovereignty. Persia benefited little from concessions; in fact, China witnessed no major railroad construction whatsoever during the nineteenth century. In the Ottoman empire the opposite was true. British, French, and German companies capitalized on concessions to build railways and to open mines, and by 1914 Germany had overtaken Britain in foreign direct investment there. In Latin America, investors from Europe and the United States built railroads, opened mines, drilled for petroleum, and harvested cash crops. Latin America, especially Argentina, also attracted a substantial number of European immigrants in the late nineteenth and early twentieth centuries, drawn to opportunities in agriculture, business, and nascent industries. In Africa, meanwhile, British, French, Portuguese, Dutch, Belgian, Italian, German, and other powers exploited the mineral resources of the continent, built railroads, settled

immigrants on confiscated land, forced the cultivation of cash crops, and divided the continent among themselves. Economic imperialism, by the time of the Great War, had fashioned a world economy consisting of nations and colonies providing raw materials and those using them to produce manufactured goods.

—*Paul Tenkotte*

Cotton Textile Production in Colonial India

In 1750, India produced one-quarter of the world's industrial output and exported cotton and silk textiles to a number of countries, including Britain. By 1830, however, India mainly sold agricultural goods in international markets and imported British yarn and cloth. This shift in India's industrial profile has prompted a vigorous debate about the reasons for the decline of Indian handicraft production, one that is closely tied to disagreements about the consequences of British colonialism in India.

In the seventeenth and early eighteenth centuries, India had a well-developed tradition of household and artisanal textile production, particularly in Punjab, Gujarat, Bengal, and the Coromandel Coast. Rural households mostly produced simple articles for domestic or village use, while artisans wove complicated designs and fine cloth. Indian merchants engaged in long-distance trade within Asia and with Africa, while Dutch and English trading companies carried on the bulk of trade with Europe. European companies advanced money to Indian merchants, who contracted with weavers over which goods to supply, price, and the time of delivery. The system provided weavers with bargaining power, as they could seek out the best price and secure what was essentially interest-free credit to produce goods.

By the middle of the eighteenth century, India's position as a principal textile exporter began to weaken. The dissolution of the Mughal empire into smaller states increased political insecurity and disrupted trade. Political instability reduced agricultural productivity, which raised the cost of grain and therefore labor costs. This in turn made Indian exports less competitive in the decades between 1760 and 1810.

Furthermore, European traders gained greater control over weavers in the second half of the eighteenth century as their agents displaced Indian merchants, whose financial position weakened as Mughal state officials withdrew from inter-Asian trade. As the British East India Company assumed increasing political authority, it introduced new legal sanctions, such as fines for incomplete orders; imposed increasingly rigorous quality standards for Indian products; and used threats of taxes and military service to compel weavers to supply textiles at below-market prices. Domestic demand for luxury goods, including textiles, declined as local rulers' influence waned in the wake of Britain's rising political power. In the early 1800s, European imports of Indian textiles fell, as industrialization, British tariffs, and trade disruptions caused by the Napoleonic Wars undermined India's position in international markets. Although the volume of Indian exports declined only slightly between 1790 and 1830, their value fell by about two-thirds, from £2,430,000 to £902,000.

Competition intensified in the nineteenth century as Indian producers battled with British products not just in export markets but in the domestic market as well. After the East India Company lost its monopoly on trade with India in 1813, Lancashire-based firms exported machine-made yarn and cloth, and India became a net importer of cloth by 1830. The expansion of railway networks cut the cost of transportation, permitting British goods to compete with local products. As a result, British imports took their greatest toll, at least in central and southern India, after 1865–1870. The value of Indian yarn imports rose from £300,000 in 1820 to £4 million in 1920; imports of cloth climbed from £1.1 million to £29.1 million over the same period. Under colonial rule, British textile mills had privileged access to the Indian market, as Indian tariffs were kept deliberately low until the 1920s, when rising Indian nationalism, competition from Japanese textiles, and the contribution of Indian industry to the First World War effort caused Britain to re-evaluate its policies toward Indian industry.

By the late 1800s, Indian artisans faced more competition from the Indian textile mills in Bombay and Ahmedabad. India's mill sector expanded after the 1870s and emerged as a

► COTTON TEXTILES IN THE INDIAN NATIONALIST MOVEMENT

From handspun cloth to the spinning wheel, textiles provided powerful images and symbols for India's nationalist movement. Many middle-class intellectuals and nationalist leaders, such as the Bengali economic historian Romesh Chunder Dutt (1848–1909) and the political leader Jawaharlal Nehru (1889–1964), used the narrative of impoverished Indian weavers to criticize Britain's deindustrialization of India and therefore British rule. The destruction of Indian handicrafts was a popular nationalist theme, with the result that a number of leaders saw Indian industrial development as a path to self-sufficiency and independence. By the late nineteenth century, nationalist thinkers advanced the idea of *swadeshi* ("one's own land"), calling for industrialization and the promotion of Indian rather than foreign products. In 1905, the

social base of *swadeshi* politics broadened as nationalists campaigned for the widespread boycott of British goods, particularly textiles, to protest the partition of the province of Bengal. In the 1920s, Mohandas K. Gandhi helped to turn *khadi* (homespun cotton cloth) and the spinning wheel into symbols of Indian nationalism. The coarse, white, handspun cloth effectively became a uniform for members of India's Congress Party, as *khadi* was identified with a universal Indian identity that could obliterate differences of class, caste, and religion. At the same time, Gandhi's emphasis on *khadi* reflected his desire to promote village and cottage industries rather than the large-scale industrialization model envisioned by leaders such as Jawaharlal Nehru.

—Caroline Arnold

significant provider of yarn and cloth for the domestic market and as a major exporter of yarn. The cotton textile mills were mostly founded by Indians and were increasingly managed and staffed by them as well, although the industry imported British machinery. This permitted India to regain its prominence in international markets: by 1913, India was the world's second-largest yarn exporter, as Indian cotton mills emerged as a major supplier of yarn to Japan and China. This, however, was short-lived, at least for Bombay's mills, as the rise of Chinese and Japanese spinning mills in the 1920s replaced Indian yarn with indigenous products and as Japan began exporting yarn to India.

The fate of traditional Indian textile producers varied according to what they produced. Spinners suffered more than weavers, as British imports and then Indian textile mills replaced hand-spinning. Between 1880 and the early 1920s, the use of handspun yarn in domestic cloth production fell from 50 percent to 15 percent. Britain's share of the Indian cloth market rose from 10 percent to 60 percent between 1850 and 1880, and an estimated equivalent of 2 million to 6 million Indian jobs were lost. Weavers had to compete with British cloth but benefited from rising demand for coarser cloth in the domestic market beginning in the early 1900s.

Current scholarship emphasizes that Indian handicraft production rebounded in the second half of the nineteenth century and the first half of the twentieth century. Scholars such as Tirthankar Roy and Douglas Haynes have argued that shifting market conditions prompted handicraft producers to change technologies, adopting the fly shuttle and beam warping; to use dyes imported from Europe; and to reorganize production into small units that employed wage labor. As weavers accumulated capital, better-off weavers began to replace handlooms with used power looms. After 1900, weavers, particularly in western India, founded small factories that adapted to changing local demand.

Indian Industrialization under British Rule—Tata and Tagore

Domestic industrialization in India under the British Raj has always been a controversial issue. British colonial rule, in fact, has been often accused of favoring a process of gradual de-industrialization by destroying Indian indigenous industries, mostly the textile industry. Although the idea that colonial domination was not conducive to a full-fledged economic growth has been challenged and in some cases rejected, the issue is still debated.

The industrial enterprises launched by the Tata and Tagore families in the nineteenth and early twentieth centuries provide a lens through which Indian industrialization under British rule can be approached. Besides being one of the most successful examples of family business in India, these families significantly contributed to

Indian industrialization. They represent two different ways of conceiving and carrying out industrial activities based on differing perceptions of the role of India within the British Empire.

The Tagore family was wealthy because of extensive landholdings and became involved in business activities in the eighteenth century and especially the nineteenth century. Dwarkanath Tagore (1794–1846) gave the Tagore family its stable and long-standing financial foundations. He successfully became involved in business in the early nineteenth century, when he began to work in conjunction with European agency houses (enterprises that represented British companies in the Indian market) based in Calcutta. In 1834 he launched the first Anglo-Indian partnership, Carr, Tagore & Co., that played a significant role in the economic life of British India. The firm came to own and manage several enterprises such as the Bengal Salt Company, the Steam Ferry Bridge Company, and the Bengal Coal Company, among others. Dwarkanath Tagore was a farsighted entrepreneur and was able to diversify his economic interests by entering new businesses such as coal mining and producing and manufacturing silk, indigo, and sugar. As a businessman, he believed that the connections established with Great Britain were beneficial to India. In fact, he envisaged the material and spiritual progress of his country under the protective umbrella of British colonial rule. Apparently he never thought of the British colonial domination as a major drawback for his country's economic growth. His son, Debendranath Tagore (1807–1905), led the family after Dwarkanath's death and continued the family's entrepreneurial activities.

Unlike the Tagore family, which was from Bengal, the Tata family was from western India. The founder of the present-day Tata Group—an international conglomerate with interests in different industrial sectors and in many countries—was Jamsetji Nusserwanji Tata, a Parsi businessman from Gujarat. He started his entrepreneurial activities while working in his father's banking firm and eventually established his own branch in Hong Kong in 1868. In 1871 he launched the Central Indian Spinning, Weaving and Manufacturing Company, Limited, taking advantage from the Indian cotton boom

➤ TATA EXPERIMENTAL SILK FARM

In 1895, Jamsetji N. Tata established a modern silk farm in Mysore (present-day Karnataka) as part of his business in textile production and manufacture. His idea was to support the raw silk industry in that area through an experimental project based on the technical improvement of the local sericulture. The silk industry was languishing because of the lack of state support and the outbreak of *pebrine*, a disease that mortally affected silkworms. The Tata silk farm, located 2 miles (3.2 kilometers) away from Bangalore, was placed under the management of a Japanese silk expert who trained students and cultivators in the modern techniques of rearing silkworms and reeling silk. To hire experts from abroad especially from Italy or Japan, which were at the forefront of technical innovations in sericulture, was a widespread practice in those years. In 1910 the Tata Experimental Silk Farm was taken over by the Salvation Army, which continued the activities started by J. N. Tata.

—Antonella Viola

subsequent to the American Civil War, which made it more difficult for Great Britain and other cotton-consuming countries to get cotton supplies from the United States. In 1877 he opened the Empress Mill in Nangpur, and soon his firm began to gain a reputation in the Indian textile manufacturing sector. While carrying out his businesses, Tata, who was an avowed nationalist, became involved in the Indian National Congress. He was deeply aware of the importance of domestic industrial growth for India's future and became a champion of Indian self-industrialization and self-sufficiency. Unlike Dwarkanath Tagore, Tata believed that the colonial condition in which India found itself was detrimental to the country's development because of the economic and political constraints that British rule implied.

The input given by the Tata family to India's industrial takeoff during and after British rule is impressive. Under the leadership of its founder, the Tata firm grew remarkably and diversified into a number of industrial activities, ranging from electric power plants to hotels. In 1905 the firm was taken over by Dorab Tata, one of Jamsetji's two sons, who founded the Tata Iron and Steel Company. The first three decades of the twentieth century were years of further expansion, diversification, and consolidation. In 1932 under the management of J. R. D. Tata, the Tata Aviation Service was successfully started. In the years after India's independence the Tata group continued to grow and nowadays is one of the leading enterprises in the world.

In spite of the differences that characterized their economic activities, both Tagore and Tata gave impulse to a process of industrialization that was crucial to India's domestic growth and must be recognized as leading actors in the country's economy.

Egyptian Economic Development under Muhammad Ali

Muhammad Ali, the modernizing ruler of Egypt during 1805-1848, developed Egyptian industry as part of his efforts to increase Egyptian political, military, and economic strength, and therefore Egyptian autonomy, from both the Ottoman empire and Europe. He first arrived in Egypt as part of the British-Ottoman military expedition to remove French forces from Egypt in 1801, an experience that exposed him to European military planning and organization. After coming to power as governor of Egypt in 1805, he set about developing a similar military for Egypt, an effort that would require additional state revenue, increased agricultural production, new schools, and mechanized industry.

Egyptian agricultural and industrial development under Muhammad Ali rested on improving upon and restoring old practices and introducing new technologies, often with the assistance of European advisers, engineers, and machinery. He built upon one of the strongest areas of Egypt's economy—agriculture—by centralizing rural tax collection and the sale of agricultural produce. He increased production (and therefore government revenue) by introducing new crops, most notably long staple cotton in 1821; improving the irrigation system; and, in some cases, introducing centralized processing facilities. Increasing cotton production and the capacity to process it into finished textiles was essential to increasing Egypt's economic independence by reducing imports of cotton from Syria and finished textiles from Europe.

Initially, Muhammad Ali focused on developing a state monopoly over the sale of both raw materials and finished products of the craft guilds, especially those producing textiles. Between 1807 and 1809, a shipyard was opened in

► A TRAVELER'S IMPRESSION OF MUHAMMAD ALI AND HIS COURT IN ALEXANDRIA

In 1832 the English journalist and author James Augustus St. John (1795–1875) embarked on a year-long journey to Egypt and northern Sudan. He was able to visit the 63-year-old Muhammad Ali and conversed with him in Arabic. St. John described his impressions in his two-volume book *Egypt and Mohammed Ali, or Travels in the Valley of the Nile*.

“Mohammed Ali is a man of middling stature, robust and stout in his make, exceedingly upright, and, for a man of sixty-five [*sic*], hale and active. His features, possessing more of the Tartar cast than is usual among European Turks, are plain, if not coarse; but they are lighted up with so much intelligence, and his dark grey eyes beam so brightly, that I should not be surprised if I found that persons familiar with his countenance thought him handsome. . . . [H]e has . . . a certain dignity in his manner, which, in the estimation of many, even borders upon majesty. But this dignity seems almost inseparable from the possession of power: the man who can do much good or harm, whatever may be his stature, form, or features, will always appear to exhibit it; as the scorpion, in size no larger than a snail, is viewed with awe, because he is supposed to carry death in his sting.”

Bulaq, a district of Cairo on the Nile River, to enable Egypt to expand its military and economic power in the eastern Mediterranean and the Red Sea. A second shipyard and arsenal was opened a decade later in Alexandria.

After 1815, Muhammad Ali forced guild producers of textiles out of business and centralized production of goods in factories using European technical advice and machinery. Meeting the needs of the military was initially the primary focus of industrial production. Between 1815 and 1830, the government opened iron foundries,

munitions and weapons factories, gunpowder factories, and wool factories to provide material for the army and navy. Other industrial development centered on production of sugar and rum, cotton, silk and linen textiles, indigo, soap, oil, glass, leather, paper, and chemicals such as saltpeter and sulphuric acid. Centralizing and mechanizing Egyptian industry, especially in the textile arena, clashed with British interests because these textiles competed with British textiles in eastern Mediterranean markets, and their production decreased the amount of cotton available for export.

Scholars disagree about the extent to which industrial developments under Muhammad Ali were dependent on protective tariffs that increased the cost of foreign-made goods. Some argue that Egyptian textiles were protected by embargoes against cheap European textiles by the 1820s. Others claim that protection for Egyptian goods was minimal before 1830 and that local producers were able to compete with more efficient European producers because they had access to raw materials at very low prices.

After 1830, industrial expansion and centralization slowed. Muhammad Ali began loosening centralized control of agricultural and industrial development and production and attempting to decrease dependence on European technical advisers and equipment. Increasing government spending on modernization projects and extensive military operations led to additional measures to increase revenue, such as issuing and manipulating the exchange of paper currency assignments, levying new taxes, and increasing pressure on those owing back taxes. These measures further burdened an Egyptian population that had already been hit hard by drought, cholera and plague, exploitative monopolies, and forced work for the military, industry, or public works projects. These burdens as well as inefficiencies in the centralized system, lack of Egyptian managerial and technical expertise, and lack of local sources of power contributed to a decline in Egypt's agricultural and industrial sectors.

In the 1840s, European powers supported Ottoman efforts to evict Egyptian forces from Syria and the Hijaz. A subsequent agreement limited the size of the Egyptian army required Ottoman approval of foreign treaties, and required

Egyptian compliance with Ottoman laws and agreements, including the 1838 Anglo-Ottoman Convention. The treaty forbade agricultural and industrial monopolies and protective tariffs and opened up the Ottoman empire to British textile imports. While some authors argue that the Egyptian industrial sector had already been weakened to the point that it did not threaten European producers, this development ensured its demise in the face of cheaper European imports.

Early Industrialization in China

Historically, China has been recognized for its scientific and technological innovations, spanning thousands of years, as scholars Joseph Needham, Robert Temple, and others have amply demonstrated. As early as 1313, for instance, the Chinese had developed a 32-spindle machine to spin hemp into thread. During the eighteenth century, Chinese manorialism and serfdom both disappeared. Furthermore, imperial China's transportation network of canals and roads, including the 1,400-mile-long Grand Canal, was well developed by 1800. Hence, China's limited industrialization in the nineteenth century—contrasted at least with the rapid industrialization and imperialism of Europe—proves both problematic and intriguing.

Industrialization in China between 1750 and 1914 was influenced by a variety of demographic, economic, cultural, and political factors. Demographically, China's population increased from 300 million in 1800 to over 400 million a mere

50 years later (1850). As increasing agricultural yields became less possible and new land became less available, Chinese farm families relied on cottage industries, such as spinning and weaving, to supplement their livelihoods. These subsidiary enterprises, however, differed from the European putting-out system in that in Europe, merchants provided the raw material to cottagers to spin and weave, whereas in China merchants advanced money to farmers who then purchased their raw materials at nearby markets. While some peasants engaged in subsidiary labor such as spinning and weaving, millions of other Chinese immigrated to Southeast Asia or to North and South America in search of economic opportunity. China therefore had an abundant labor supply that, some scholars argue, inhibited innovations in labor-saving technology and resultant industrialization.

Other scholars, such as Mark Elvin and R. Bin Wong, have shifted the emphasis from labor to the supply of raw materials. Elvin used the example of cotton textile production to explain his assertion of China's "high-level equilibrium trap." Rice and grain cultivation, necessary to feed an increasing population, competed with cotton growing, thereby limiting the amount of cotton available for textile production. The problem, Elvin proposed, was that technological innovations are often intimately related to supply and demand. China, however, had achieved equilibrium between supply and demand in certain industries by the end of the eighteenth century, thereby trapping its industrial advance.

In addition to cotton textiles, China had well-developed ceramic, silk, and tea industries. Its export of porcelain worldwide was so well known as to earn its ceramics the name of "china" in English. The final processing of tea, including roasting, blending, and packing for shipment, generally took place in Chinese factories. By the nineteenth century, high-grade silk production for export was performed by laborers in a putting-out system similar to Europe, whereby contractors provided peasants with silk and looms.

While earlier historians argued that China lacked the capital, financial institutions, or merchant firms to launch an industrial revolution, that hypothesis has also been challenged. Before

the 1890s, except for occasional deficits, China had a favorable balance of trade with the rest of the world. This was especially true in the eighteenth century when China was infused with Spanish silver dollars in exchange for its export of silk to South America by way of Manila in the Philippines. In addition, China had a fairly efficient bimetallic monetary system, with copper coins being used for small transactions and silver bullion for larger ones. During the eighteenth century, a whole series of banks called the Shanxi developed. They made financial remittances possible across the Chinese empire, issued their own paper currencies, and even opened branches in Singapore, Russia, and Japan. China also had countless examples of large merchant firms, some of which operated for centuries. In the province of Shaanxi, for example, large lumbering operations employed 3,000–5,000 workers each by the nineteenth century.

During the second half of the nineteenth century, new industrial enterprises emerged in China in conjunction with the Self-Strengthening Movement (*zi-qiang*), an effort to reconcile traditional Confucianism with modernization. In the 1860s the government supported the establishment of factories producing armaments and ships, largely for reasons of defense. By 1872 the government shifted to a model of government-merchant partnerships (*guandu shangban*) and joint-stock companies (*gongsī*), the first of which was the China Merchants' Steam Navigation Company, founded by Li Hongzhang (1823–1901). Li, a provincial governor-general who had helped to suppress the Taiping Rebellion, became one of China's best-known statesmen. He also established China's first modern coal mine at Kaiping in 1876, and his Chinese Railway Company completed a line to Tianjin in 1888 and to outlying Beijing in 1896. That railroad was a success, unlike China's first line, the Shanghai-Wusong (1876), which was purchased and dismantled by the governor-general of Nanjing. In the late nineteenth century, the Chinese also invested in a series of telegraph lines, and in 1890 Zhang Zhidong opened his massive Han-yang Iron Works.

By the time of the Sino-Japanese War (1894–1895), the Chinese government increasingly turned to foreign loans, which totaled £92

million between 1894 and 1911. The Treaty of Shimonoseki (1895) resulted in the Japanese annexation of Taiwan as well as the Japanese right to operate factories in Chinese treaty ports and to obtain railroad and mining concessions. Because of most-favored-nation clauses based on earlier negotiations with European powers, this meant that these concessions were automatically extended to European powers as well. A race for concessions developed—sometimes referred to as “carving up the melon”—with Germany, Russia, and Great Britain securing important leases of Chinese territory in 1898. By 1900 antiforeign feelings erupted into the Boxer Rebellion, during which 20,000 European troops secured the capital of Beijing. Revolution erupted in 1911, by which year foreign interests owned 41 percent of the railroad mileage in China and had financed many of the remaining government-sponsored railroads. A republican form of government was established in 1912. By 1913 China had an estimated 549 Chinese-owned mines and factories, 96 foreign-owned ones, and 40 joint ventures. By 1914 foreign investment in China totaled over an estimated \$1 billion, led by the British and Japanese.

Japan—Industrialization during the Meiji Period

Japan during its Meiji period (1868–1912) transformed itself from an isolated agricultural state into a modern industrial and military power. At the time of the Meiji Restoration in 1868, Japan had a largely agriculturally based economy, with approximately 70 percent of the population engaged in farming or related pursuits. By the turn of the century, however, the Japanese had established a sufficiently strong industrial base and military strength to defeat one of the world's great military powers, Russia, in the Russo-Japanese War (1904–1905).

The opening of Japan to foreign trade in 1859 exposed the Japanese to the advanced industrial technology and the modern political and economic systems of the West. Alarmed that their country might become a colony of one or more Western states, the new Meiji government inaugurated a series of policies and activities

beginning in the early 1870s designed to bring about the economic, military, and industrial transformation of the nation. The Meiji government played a critical role as the major planner, promoter, and coordinator of the industrialization process.

Despite the relative backwardness of its economy in the 1860s, Japan had several distinct advantages as it embarked on its drive to industrialize: a young and highly educated workforce, a surplus of agricultural workers, and a strong central government dedicated to modernization. A highly developed tax system based on tax payments made by farmers provided revenue that the government used to modernize the country.

The Meiji government took the first steps to promote industrialization in the early 1870s by establishing a new uniform currency with decimal denominations and a banking system based on the U.S. model. The government modernized the nation's infrastructure and communications systems by initiating the construction of state-managed railways and postal and telegraph services and subsidizing several shipbuilding concerns that quickly increased Japan's shipping capacity. By the late 1870s and early 1880s the

➤ EARLY HISTORY OF MITSUBISHI

Mitsubishi was begun in the early 1870s by Iwasaki Yataro. An ambitious, intelligent entrepreneur, Iwasaki became manager of a semipublic trading and shipping firm owned by the former Tosa Domain (now Kochi Prefecture). Through his political connections and great business acumen, Iwasaki transformed the firm into a private company that he named Mitsubishi in 1873.

When the Japanese government launched a naval invasion of Taiwan in 1874, it hired Mitsubishi to ferry the troops. The government donated several more ships to Mitsubishi's small fleet to speed the transport of more military personnel to Taiwan. In 1877 the government again gave Iwasaki more ships and a generous subsidy in return for transporting marines to suppress the Satsuma Rebellion in Kyushu. Thus, by the late 1870s Mitsubishi controlled virtually the entire Japanese commercial fleet.

Starting in the mid-1870s, Iwasaki quickly diversified his enterprise and laid the foundation

of a financial and industrial empire. Mitsubishi bought rich coal and copper mines, opened a chain of profitable banks, and became heavily involved in real estate activities. It also acquired the massive Nagasaki shipyards from the government, which permitted Mitsubishi to become a major builder of Japan's commercial and military ships. When the government, desperate for cash in the late 1880s, sold Mitsubishi a large tract of land in front of the Imperial Palace in Tokyo, the company built the city's core Marunouchi Business District.

By 1917 Mitsubishi had grown so large that its managers spun off seven subsidiaries: shipbuilding and engineering, iron and steel, mining, trading, banking, marine and fire insurance, and warehousing. Later spinoffs in the 1920s included Mitsubishi Aircraft and Mitsubishi Electric Corporation. By 1928 Mitsubishi had emerged as one of Japan's major business conglomerates.

—Daniel Métraux

government also had become involved in various mining and armaments industries. By 1881 the state was running nine coal mines as well as an iron mine and produced most of the gold and silver mined in Japan. During the 1870s the government also built a wide range of factories that manufactured such things as tools, cement, glass, and bricks.

The key industry of the early Meiji era, however, was textiles. To reduce Japan's dependency on textile imports from Britain, the United States, and other Western states, the Meiji government played a prominent role in the financing and construction of model pilot mills for silk reeling, cotton yarn spinning, and woolen goods. The most famous of these was the Tomioka Silk-Reeling Mill, completed in 1872. At first the government hired a number of foreign technicians to provide the technical know-how for the running of the mills and bought ten cotton yarn spinning machines from the British.

Although the Meiji government played a key role in the first stages of Japanese industrialization, the private sector ultimately made the greater contribution. Some of the early entrepreneurs were members of the wealthy merchant families of the late Edo period (1600–1867), but in time most business leaders came from samurai, peasant, or less-wealthy merchant families who sought personal wealth while strengthening the nation. The government often assisted their firms with subsidies, technical advice, and the sale of industrial equipment at or below cost. For example, the government eventually sold the cotton yarn machines from Britain interest free to Iwasaki Yataro (1835–1885), which helped him become Japan's first major shipping magnate and the founder of the Mitsubishi conglomerate.

There was a vast expansion of Japanese industry in the late 1800s and early 1900s. By 1900 there were as many as 70 cotton spinning mills in the country as well as a vast number of silk reeling and woolen textile establishments. Other major industries included papermaking, shipbuilding, flour milling, and mining. By the end of the Meiji era, Japan was the world's third-largest shipbuilder. Japan also became a major producer of iron and steel with the opening of the government-run Yawata Iron and Steel

Works in 1901. There was a vast expansion of railways when in 1906 the government nationalized all private rail lines. The Meiji period ended just before the start of World War I, and by that time Japan had become a major industrial and military state that rivaled the West.

Industrialization in Latin America before 1914

The economy of Latin America before 1914 centered on the production of agricultural products and minerals for export, as had been the case for nearly three centuries while the region was part of the Spanish and Portuguese empires. Little changed with independence, as the economies of the new republics suffered from a lack of capital and stagnant domestic markets. In fact, the end of the Spanish mercantile trading system had devastating effects. In the early 1820s foreign trade flourished, as mostly British consumer goods, including china, clocks, furniture, clothing, wine, beer, and other liquors were exchanged for agricultural commodities and, more importantly, for gold and silver. However, by the mid-1820s the Latin American demand for these products had been satisfied, and the market evaporated, resulting in excess inventories of products that eventually were liquidated at prices far below the cost of manufacture. This resulted in a panic in London, the financial center of international commerce at the time, and foreign investment decreased. The opening up of foreign trade also impacted local manufacturing. For example, Mexico in the 1840s and 1850s had developed small but inefficient workshops

(*obrajes*) that produced cotton textiles for local consumption. These enterprises were soon put out of business by the flood of lower-priced and higher-quality British textiles. The exception was the guano trade in Peru. It was not until 1850 that foreign capital increased for Latin American industrialization projects. Political chaos and the rise of unpredictable dictatorships further inhibited industrial development in much of the region.

By midcentury much of Latin America began to experiment with liberalism and positivism, political philosophies that encouraged states to foster industrialization. Even some conservative governments, such as the administration of Gabriel García Moreno in Ecuador, took on the mantle of modernization by promoting infrastructure improvements. Railroad construction resulted in lower transportation costs, increased the exportation of agricultural products, and generally stimulated the growth of industrialization. Technical experts, known as the *científicos*, were recruited in Europe and the United States to oversee the myriad modernization schemes. Lucrative contracts were granted to European or North America companies to exploit the natural resources of Mexico, Chile, and other countries. In some instances, particularly Mexico, foreign companies obtained ownership of land, mines, and petroleum fields. The liberals also improved education and encouraged immigration of skilled workers from Europe, thus upgrading the labor pool. Additional capital was made available in some countries when the communal holdings of various indigenous groups were confiscated and then sold to foreign investors. Another source of capital used to promote industrialization came from the expansion of agricultural exports. Profiting from a boom in exports of cacao (from which cacao is derived), Ecuador used its improved trade balance to build the Guayaquil and Quito Railroad, among other internal improvements. Brazil used coffee revenues to establish small factories that manufactured the bags the coffee was shipped in. The accumulation of surplus capital in the industrialized nations provided another source for industrial development in Latin America.

From the middle of the nineteenth century until the start of World War I in 1914, economic

growth in Latin America was tied to agricultural exports. The industry that did develop was small and used low technology. Most industrial enterprises manufactured products for local consumption or prepared agricultural products for export. Industrial output was a very small part of all Latin American nations' gross domestic products, which were dominated by primary products such as sugar, coffee, crude oil, bananas, and cacao. Nevertheless, the foundation was laid for industrial expansion in the latter portion of the twentieth century. This included the development of an urban labor class and the establishment of industrial organizations such as the Industrial Union of Argentina in 1887 that promoted a favorable business climate. Not surprisingly, the countries that experienced the greatest amount of industrial growth in this period were rich in natural and mineral resources. By 1901, Mexico was producing steel, and Argentina, Brazil, and Chile had emerging industrial centers.

Mines and Mining in Africa

Africa's mineral wealth attracted and intrigued Europeans for centuries. Ashanti gold found its way across the Sahara, the Portuguese traded in the gold of Monomotapa, and Katanga copper was traded throughout the continent and as far as China as early as the tenth century. In the colonial era, gold and other minerals were both the primary attraction for people seeking wealth and the basis of the general insistence that imperial territories should ultimately finance their

own exploitation. By far the greatest amount of capital investment in colonial Africa was to develop mining and build the railways necessary for importing equipment and mine stores.

In the nineteenth century, Ashanti gold continued to be the object of European interest, but the real scramble for gold, diamonds, and other minerals took place farther south. In 1866 a pebble that turned out to be diamond was found at Kimberley. Other diamonds were found, setting off a major rush. Soon the search was on for the pipes, the source of these alluvial stones, and one important pipe was found farther north under the De Beers farm. This, with financial support from the Rothschilds, became the basis of Cecil Rhodes's fortune, De Beers Consolidated.

In the meantime, gold was discovered on the Witwatersrand (also known as The Rand). Rhodes was slow to take an interest, but using De Beers' profits and further, albeit reluctant, help from Rothschild, he established a foothold with Consolidated Gold Fields and started the group system of mine ownership that was to characterize the South African mining industry. The Rand deposits made up in extent what they lacked in the quality of the ore, making The Rand the focal point of South Africa's gold mining industry well into the twentieth century.

Hopes of finding a "Second Rand" in Mashonaland never materialized. In 1889 Rhodes, seeking more gold and a way to restrict the Boer Transvaal Republic's northward expansion, secured a British government concession to administer and commercially develop the area that became Southern and Northern Rhodesia. Rhodes's British South Africa Company (Chartered) found gold, but Rhodes and his colleagues made more money from share manipulation and speculation than they did from working gold deposits. The only other mineral deposits that proved valuable in the shorter term were the Wankie coalfields, which produced great quantities of high-quality coal. In the meantime, Chartered reluctantly agreed to build a rail line to the Katanga border, where it was subsequently to be connected to the developing copper mines there.

In the aftermath of the Berlin West Africa Conference of 1884–1885, Leopold II of Belgium

peremptorily included Katanga within the territory of his Independent Congo State. The conference participants knew little about the region's potential, and it was generally thought preferable to have "neutral" Leopold there than any of the rival imperial powers. Still looking for more gold, Rhodes thought that he could take the area if he secured a treaty with M'siri, the local ruler. Rhodes might have been right, but Leopold's expedition got there first and his soldiers killed M'siri, and no one further contested Leopold's claim. Hopes of finding gold proved futile, however, and Leopold proved unwilling to invest the capital necessary to exploit the region's copper. Because of Belgian reluctance to invest in the Congo, a large proportion of that capital came initially from British financiers.

In 1895 George Grey, employed by Robert (later Sir Robert) Williams, acting at Rhodes's request on behalf of a syndicate including one of the Prince of Wales's mistresses, Daisy, Countess of Warwick, explored one end of what was to become the Northern Rhodesian Copperbelt. Clandestine visits across the border convinced Grey that Delcommune had been wrong. Urged by Williams, Leopold agreed to the formation of the Union Minière du Haut Katanga in 1906. Technical difficulties meant that full-scale production only began in 1912; ultimately Katanga became one of the world's major sources of copper.

1906 also saw the formation of the Société Internationale Forestière et Minière (Forminière) to work Kasai's extensive diamond deposits. Financial support came primarily from the American-British-Irish mining engineer Alfred Chester Beatty (later Sir Chester). Kasai diamonds are, for the most part, of industrial rather than gem quality but nonetheless have been a valuable export commodity for the Congo. After Congolese independence, diamond smuggling was largely tolerated, as it helped limit the effective devaluation of the Congolese franc on the parallel ("black") currency market. Forminière itself became a holding company and advised on other enterprises in the region. More recently, it became a target for outsiders from Zimbabwe and elsewhere to gain an economic and political foothold in the region.

Diamonds were found in many parts of Africa: Angola, Namibia, Sierra Leone, etc. Virtually all came to be linked to the Anglo-American Corporation and De Beers, which continued to control the volume of diamonds actually reaching the market. It was Rhodes who first operated the system whereby the number of diamonds reaching the market was severely limited; only in this way could a high price be maintained. To this day, no one has been able to successfully challenge De Beers's dominance of the market.

■ Introduction: International Trade

Spectacular, unprecedented growth marked the history of world trade in the nineteenth century. In 1913 the volume of world trade per capita was 25 times higher than it had been in 1800, a statistic made even more impressive by the fact that in the 1800s the world's population increased from approximately 978 million to 1.8 billion. The most rapid growth in trade occurred from the early 1840s to the early 1870s, when international commerce grew on an average of 6 percent a year, five times faster than the rate of population growth and three times faster than the actual increase in population. Only somewhat less remarkable was the degree to which world trade in the nineteenth century was dominated by Europe, which accounted for 60-67 percent of all imports and exports even though Europeans made up only 20 percent of the world's population. If one adds North America, which in 1913 accounted for approximately 13 percent of world trade, "the West" accounted for 75 percent of world trade compared to 11.1 percent for Asia, 7.6 percent for Latin America, and 3.7 percent for Africa.

Many factors contributed to the expansion of world trade. Population growth, much of it occurring in cities, increased demand for food, other basic commodities, and "luxury" items such as coffee, tea, sugar, tobacco, and cacao. Industrialization required an ever-increasing quantity of raw materials that ranged from basic fibers such

as wool and cotton to sisal for making rope and twine and palm oil for making soap and lubricating machines. The near-universal acceptance of the gold standard as the basis for the international money system encouraged trade by making it possible to carry on transactions in many different currencies, all of which could be converted to a set amount of gold. Late-nineteenth-century imperialism, by which Europeans gained access to the mineral wealth of their African and Asian colonies and were able to encourage or force their colonial subjects to grow crops that could be sold on the world market, also played a role in the expansion of global commerce.

By far the most important factor was the removal of two obstacles, one artificial and one natural, that had hampered the flow of goods through trade. The artificial obstacles were government-imposed tariffs on imports and exports and the outright prohibitions on the import of certain goods. They also included policies of countries such as Japan, which beginning in the 1600s permitted only one Dutch trading ship a year to transact business in Japan, and China, which restricted trade with Europeans to one port and only at certain times of the year. Beginning in the mid-seventeenth century, British navigation acts restricted the use of foreign shipping between its colonies and Great Britain. Although French physiocrats and the Scottish philosopher Adam Smith advanced powerful arguments in

favor of free trade in the eighteenth century, Great Britain, the world's economic powerhouse, committed itself to free trade only in 1846, when Parliament abolished the Corn Laws, which since 1804 had protected British farmers by placing high tariffs on imported grains. France adopted free trade in 1860, and other countries, with the notable exceptions of the United States and Canada, followed suit. During the nineteenth century European states abolished or lowered tariffs in their colonies and forced Japan and China to keep tariffs low through provisions of the unequal treaties they imposed on both states. In response to the economic slump of the 1870s, several European states raised tariffs but not enough to erect true trade barriers. Until after World War I, the world economic system was marked by the extreme mobility of goods across political borders.

Before the nineteenth century the greater obstacles to international commerce were the high cost of transportation, especially land transportation, and the difficulties of communicating over long distances. In 1800 a letter from London to India took five to eight months to be delivered depending on the season; by 1870 a message sent by electric telegraph took just five hours. In the area of transportation, the era began with a flurry of canal and road building in Europe and the United States, but truly revolutionary changes began only after inventors found ways to utilize steam engines as a source of power for land and water transportation. The first steamboat appeared in England in 1812, and by the 1860s virtually all new British ships were powered by coal-burning steam engines. By 1913 only 2 percent of British shipping was being carried on sailing ships, and a trip from Liverpool to New York took only ten days. The opening of the Suez Canal in 1869 shortened the voyage from London to Bombay (Mumbai) by half and to Singapore by almost a third. The introduction of refrigerated transport ships made it possible to export frozen meat and other perishable goods from as far away as South America, New Zealand, and Australia. The most important technological breakthrough for world commerce was the railroad. The first commercially viable railway line opened between Liverpool and Manchester in 1830. With amazing speed railways spread to the rest of the world,

where they revolutionized personal travel and military planning. In the area of world trade the railroads' main contribution was to provide an inexpensive, reliable means of transporting minerals and agricultural goods from interior regions to coastal ports, where these products were loaded on steamships and carried to buyers around the world.

—James H. Overfield

World Trade— A Statistical Overview

States have long seen international trade as an important source of prosperity and tax revenues. As a consequence, they have been recording the value of their external trade for a long time. Historians have been able to use these records to track the evolution of world trade. The value of world trade in gold increased dramatically between 1750 and the First World War. Available data underestimate trade among Asian countries in the eighteenth century. Hence, the growth rate that one can compute (2.5 percent a year, or a multiplication by more than 50 in 163 years) is probably an overestimate of the actual growth rate.

From a purely descriptive point of view, the increase in the value of world trade can be attributed to three mechanisms. First, the purchasing power of gold declined by half. Second, the real size of the world economy increased over fivefold between 1750 and 1913 as a result of the Industrial Revolution and the increase in the world's population. Third, international trade became more important to the world economy: the ratio between world merchandise trade and world production was multiplied by approximately five.

The rise of trade in the world economy was not a continuous phenomenon. During the eighteenth century, intercontinental trade increased steadily as Britain, France, the Netherlands, Portugal, and Spain played important roles as centers for world trade. They imported goods from their American and Asian empires while exporting goods from Europe to their empires. Furthermore, they also controlled trade from America to Asia (precious metals and luxuries). Colonial empires were central in the system. American empires yielded precious metals that were used by Europe to pay for imports from

Asia. American empires produced goods such as sugar, tobacco, coffee, cotton, or furs, which were in high demand in Europe. African trading posts allowed the slave trade that was integral to the production of plantation goods in the Americas. Asian empires and trading posts allowed the partial control of regional Asian trade and the gathering of goods produced in both dependent and independent parts of Asia for European consumption (china, cotton cloth, spices).

This system was swept away by the Napoleonic Wars and the Industrial Revolution. The Dutch, French, Portuguese, and Spanish empires were severely weakened, and Britain became the dominant trading power. Exotic foodstuffs became a smaller share of world consumption as the consumption of industrial goods increased following the Industrial Revolution. Newly independent nations (including the United States) and European nations adopted protectionist policies to protect their industries from British competition. While there was no absolute decline of trade, it declined relative to the size of the world economy up to the 1830s.

World trade rebounded after the 1830s due to the transportation and communication revolution, including the diffusion of railroads, steamships, refrigeration, and the telegraph and the construction of intercontinental canals (Suez and Panama). Railroads were important to world trade. Although they were not very important links between countries, they were very important in linking the interior of countries (especially the United States and Russia) with their seaports, easing trade in bulky merchandise.

During the nineteenth century, international trade commerce also was encouraged by the increasing acceptance of free-trade policies. It was symbolized by the abolition of the Corn Laws in Britain in 1846 and the network of free-trade treaties inaugurated by the Cobden-Chevalier Treaty between France and the United Kingdom in 1860 (however, tariffs had already been declining in the 1850s). It was less important to the increase of world trade than the transportation revolution. European imperialism again played a role in the rise of trade. For example, the British fought the Opium Wars to force China to accept opium imports from India. The renewed wave of colonization in the nineteenth century

was associated with the opening of colonial markets to European products. The growth of world trade stalled during the economic depression from 1873 to 1896 and the rise of agricultural protectionism in Europe. But it took off again before the First World War.

Trade made the convergence of commodity prices between different continents possible, as the decline of trade costs helped traders to arbitrage, buying goods in low-price areas for sale in high-price areas. Commodity price convergence was not very important in the eighteenth century, but prices for some products began to approach convergence later in the nineteenth century. For example, between 1870 and 1913, the wheat price gap between Liverpool and Chicago fell from 57.6 percent to 15.6 percent. The London-Rangoon rice price gap fell from 93 percent to 26 percent, and the Liverpool-Bombay cotton price gap fell from 57 percent to 20 percent.

The decline in transport costs was accompanied by a growing trade in bulkier commodities. Whereas eighteenth-century trade was centered on expensive exotic goods that could not be produced by their importing consumers (e.g., sugar in the United Kingdom), nineteenth-century trade saw the rise of trade in goods that competed with Europe's agricultural products. Manufactures represented only 36 percent of world trade in 1913, minerals (including coal, oil, and iron) represented 14 percent, and agricultural goods (both foodstuffs and raw materials) represented 50 percent. Europe was a net importer of primary products and a net exporter of manufactures. The rest of the world, including North America, had a deficit in manufactures and a surplus in primary products.

During this whole period, Europe dominated world trade. In 1913, more than half of world trade flows had Europe as the exporter, the importer, or both. Europe as a whole, and the United Kingdom in particular, imported more goods than it exported. This was compensated both by revenues from external capital investments and by the export of business services. All other regions in the world exported more goods than they imported. They exported raw materials to Europe to pay for European manufactures, services, and investments.

The First Great Depression, 1873–1896

The Great Depression (also known as the "Long Depression") of the 1870s and 1890s describes a sharp economic downturn that was experienced to some degree by most industrializing countries. The economic downturn was caused by a combination of national and global developments. When several of the leading economic powers began to experience disruptions in growth during the 1870s, they had already grown connected so closely through flows of capital and commodities that the causes, characteristics, and consequences of this depression have to be framed within an international context. The disruption of economic development was felt with particular severity because it fell between two periods of economic expansion and optimism, the first between 1850 and 1870 and the second between the late 1890s and World War I. The 23 years in between came to be known by the term Great Depression, coined by contemporaries in Great Britain. The phrase is today often used to describe the situation there as well as in France and Germany. Although the United States went through two severe economic slumps after 1873 and 1893 and experienced a brief economic fall in the 1880s as well, the term is rarely applied to the era of U.S. history designated as the Gilded Age.

The year 1873 witnessed a series of panics at financial markets in Europe and the United

States ignited by speculative investments in booming industrial sectors during the previous years. The economic slump that followed was marked by three distinct downswings in the global economy with brief periods of moderate recovery. After the initial shock, most of the affected countries experienced a sharp decline in economic growth, which reached its trough in the late 1870s. The second phase of decline followed during the first half of the 1880s but did not affect all major economies as severely as the preceding crisis. For example, while the German economy as well as the economies of the Benelux countries did not significantly shrink during this decade—as measured by per capita gross domestic product (GDP)—France and Great Britain as well as the United States and Australia went through periods of negative growth during the mid-1880s. Most economies started to recover in the late 1880s, but the return to earlier levels of economic growth was delayed by a third downswing in the early 1890s. The beginning of a fresh and prolonged period of economic growth is generally dated to 1896.

Economic failure in the Great Depression can be linked in part to specific features of the individual economies affected and, in part, to the process of globalization. Prior to the Great Depression, decades of rapid economic growth in the Western Hemisphere, groundbreaking improvements in ship and rail transport as well as in communication, a broad acceptance of the gold standard, and the predominance of free trade policies had linked national markets to a world economy. While national production, especially in industry, increased steadily, rising national but especially international competition fueled by technological and organizational progress put more and more businesses under the pressure of comparative cost advantages. For example, in the global market for agricultural products, European producers were undercut by competitors from as far away as the United States and Australia, which were able to offer wheat at a far lower price than in Europe. At the same time, the agricultural sector lost its predominant weight in the economies of the industrializing countries and was thus hit extraordinarily hard by such events. Similar transitions to international markets can be traced in other

economic sectors, for instance the trade in iron and steel (crude and processed), which contributed to the succession of Great Britain as the world's leading steel producer first by the United States in 1890 and later by Germany in 1894.

Surprisingly, the economies of the 16 most-developed countries, a group formed by the industrial countries of Western Europe, the United States, and Canada as well as Australia and Japan, did not on average actually shrink but instead grew through the period of the Great Depression. Therefore, the Great Depression can be viewed as merely a slowdown in economic expansion with erratic fluctuations. According to estimates by the economist Angus Maddison, the growth of national GDPs in the industrialized countries was an average of 3.1 percent from 1850 to 1872 and from 1897 to 1913 but only 2.4 percent from 1873 to 1896.

Why then was a rather moderate slowdown perceived as a Great Depression by many contemporaries? On the one hand, the diminished economic expansion coincided with a sharp decline in prices caused by a relatively slow growth in the volume of money as compared to economic output. On the other hand, the adverse effects of the transition to a globalizing economy had to be swallowed in the midst of the transitory process from preindustrial to industrial economies and societies in many countries, which in itself was a disturbing experience for many people. The Great Depression can therefore only be understood by considering its national peculiarities as well as its complex economic, cultural, social, and political context. The study of the Great Depression thus provides an example of discrepancies between the empirical and psychological dimensions of a historic event.

Among the many consequences of the Great Depression, three were particularly important. First, many European countries turned away from free trade policies and returned to protective tariffs to shield their economies from international competition. In addition, the creation of controlled economic spheres through colonial expansion gained new momentum. Second, the Great Depression gave impetus to the formation of trade associations, labor unions, and industrial pressure groups; it also strengthened

➤ THE GREAT DEPRESSION—MYTH OR REALITY?

The First Great Depression (also known as the Long Depression) has been a subject of debate in economic and social history. The term was again revived and made prominent by the economic historian Hans Rosenberg in the 1960s to describe the coincidence of an economic crisis and the spread of economic pessimism, political extremism, and social conflict that seemed to mutually amplify each other throughout Germany in the late nineteenth century. Rosenberg linked the rise of anti-Semitism in Germany directly to the experience of the Great Depression, which he thought paved the way for the rise of Nazism and the Third Reich. Later research has demonstrated that in Germany, as in other countries such as France or the United Kingdom, the economic dimensions of the Great Depression have been exaggerated. Furthermore, the transformation of traditional anti-Semitism into an ideology of racial superiority through National Socialism has been shown to have been fueled by a much more complex set of factors. While the Great Depression has even been called a myth by its critics, the term is still widely used to describe those decades as a period of tremendous social and economic transformations from a contemporary perspective.

—Christoph Rass

the emergence of cartels and trusts as economic actors tried to cope with the uncertainties of modern markets. Third, the Great Depression accelerated technological progress in many areas as economies struggled to improve their competitiveness on the international stage. It thus contributed to the formation of the second generation of leading economic sectors such as chemical, electrical, and machine construction industries.

Suppression of the African Slave Trade

The suppression of the African slave trade was one of the most impressive developments of the nineteenth century. The enslavement of humans and commerce in human slaves had existed in most societies for thousands of years. Slavery was a normal and accepted feature of almost all civilizations, venerable in age and hallowed by the scriptures of most religions. In the last quarter of the eighteenth century, the egalitarianism implicit in much of the European Enlightenment, coupled with intense evangelical Protestant publicity, impelled the British Parliament to pass in 1807 the Act for the Abolition of the Slave Trade. The slave trade did not end with the passage of this act, however. More than seven decades of continuous agitation by missionary groups as well as vigorous efforts on the part of the British Royal Navy and British diplomatic and economic pressure occurred before slavery was suppressed.

The Royal Navy launched patrols to intercept slave traders on both sides of the Atlantic, especially after the end of the Napoleonic Wars. In 1820 the American Congress defined slave trading as piracy and decreed for it a sentence of death, a sentence that was only once carried out (in 1862). In 1824 the British also declared the slave trade a form of piracy and decreed the death penalty. From the end of the Napoleonic Wars until after the American Civil War, a large part of the Royal Navy was employed in suppressing the slave trade. The Royal Navy detailed a fleet, called the West Africa Squadron, to patrol the West African coast from which a majority of slave cargos originated. Before 1819 the West Africa Squadron consisted of only six ships, but by the middle of the century about a sixth of the ships and several thousand of the sailors and marines of the Royal Navy were employed in this duty. This is in addition to over 1,000 African sailors who worked with the Royal Navy.

During the Napoleonic Wars, the British interpretation of the doctrine of belligerent rights allowed the Royal Navy to board and search the ships of any nation, but when peace emerged the British needed diplomatic cover to continue boarding and searching foreign ships. Great Britain used its economic power and diplomatic muscle to persuade, cajole, and pressure other nations to suppress their parts in the international slave trade. In 1831 the French government banned the internal slave trade (but not slavery) in its possessions. By the 1840s British diplomats had signed treaties with almost all European states, including Prussia and Russia, that allowed the Royal Navy to board their merchant ships if they had reason to suspect that they carried slaves.

After 1819 the West Africa Squadron used Freetown, Sierra Leone, as its main base. Freetown had been founded in the late eighteenth century by freed Afro-American slaves who had supported the British in the American Revolution. Freetown, which became a British Crown colony in 1806 and later was the capital of British West Africa, was the place where the slaves who were rescued from the slave ships captured by the West Africa Squadron were settled. In total, the West Africa Squadron settled about 160,000 rescued captives there.

The Royal Navy's activity in seizing slave-trading ships led to an arms race with the slavers. The slavers began to use faster craft, such as American clipper ships, to outrun the navy. The West Africa Squadron's response was to use faster side-paddled steamships and craft that had a shallow draft so they could pursue the slavers up rivers. Also, the British began to cut the slavers off at the source, blockading the African coast and landing marines to seize the baracoons (compounds) where enslaved captives were held for boarding the slave traders' vessels.

The British also tried other methods to shut down the supply of slaves such as pressuring and even threatening African rulers. In the 1820s the British began occupying the trading posts on the Gold Coast (now Ghana), but they did not eliminate this area as a supplier of slaves until the British fought the first of four wars against the Ashanti during 1863–1864. In 1851

British troops occupied the Kingdom of Lagos, the major supply in Yoruba land. Ten years later the British would annex Lagos, and it would become the capital of Nigeria. Thus, the drive to suppress the slave trade led to the establishment of the British West African empire.

In East Africa, the British campaign against the slave trade was later than on the west coast but followed a similar pattern. Protestant missionaries, such as David Livingstone, explored the hinterland where the Arab and Swahili slave traders acquired their “merchandise” and publicized the horrors of the East African slave commerce through missionary literature and, in Livingstone’s case, the Royal Geographic Society. The British used naval and diplomatic pressure to force the sultan of Zanzibar, who claimed jurisdiction over much of the coast including the towns of Mombasa and Dar es Salaam, to sign treaties limiting the trade. To enforce these treaties, the British established in 1890 the British Protectorate of East Africa, which included Zanzibar and Mombasa but not Dar es Salaam.

Brazil was the largest importer of slaves in most of the nineteenth century. Although Brazil legislated against the trade in 1831, the enforcement of anti-slave trade laws was negligible, and slave importation doubled over the following ten years. In 1845 British legislation declaring the slave trade to be piracy authorized British naval vessels to pursue slave traders in Brazilian ports. British actions in Brazilian ports impelled a reluctant Brazil to effectively end slave imports in 1850. Cuba was the other large-scale destination for nineteenth-century slave cargos, and in spite of British and American pressure, the last Africans were imported to the island as late as 1866. The major problem with ending the slave trade to Cuba was that American ships, which the Royal Navy after the War of 1812 did not molest, carried on much of the trade to Cuba. The United States was the main exception on the list of seagoing countries that refused to sign a treaty allowing the Royal Navy to board its ships looking for slaves. Instead, the Americans by a treaty of 1819 and another treaty (the Webster-Ashburton Treaty) in 1842 promised to have their own navy patrol the coasts of Africa and police its own merchant marine. The United

➤ ECONOMIC FORCES AND THE ENDING OF THE SLAVE TRADE

For many years it had been argued that the slave trade and slavery came to an end because of economic reasons. In the middle of the twentieth century, the interpretation accepted by the majority of historians was that slavery was not as profitable as free labor, so the institution, especially in the British West Indies, was declining. Likewise, these historians believed that the international slave trade would have also proved unprofitable in the face of the mass transatlantic migration of European free whites. More recently, economic historians, such as Robert Fogel in *Without Consent or Contract: The Rise and Fall of American Slavery* (1989), have pointed out that the most prosperous decades in the history of the slave trade were the two just prior to the suppression of the trade. And Seymour Drescher, in *Econocide: British Slavery in the Era of Abolition* (1979), calls the suppression of the slave trade and slavery “econocide.” He and other historians maintain that the suppression of the slave trade was not caused by economic forces but instead was accomplished in spite of these forces.

—Wilfred J. Bisson

States did maintain a few ships patrolling off the coasts of Africa, but its efforts in enforcing the ban on the slave trade were largely ineffectual until the American Civil War.

The suppression of the African slave trade was a result of a fortuitous chain of contingencies. First, a small group of religious dissenters were able, by riding the wave of increased religious fervor, to affect the policy of the world’s leading superpower, Great Britain. Second, that superpower used its economic and political influence as well as its naval power to impose that policy on a global scale.

That the slave trade, a cultural practice that had existed nearly unchallenged since the beginning of sedentary human history, would be destroyed in such a brief time could not have been predicted when the movement to abolish the slave trade began. The success of that movement marked a milestone in the growth of a new conception of human equality.

Trade and Commerce in Southeast Asia

Around 1750, trade and commerce in Southeast Asia as a whole were still of marginal significance because of transport impediments. Some

areas depended on foreign trade, but local communities were self-sufficient to a high degree. Given the cost of transport, goods traded over longer distances tended to be luxury products with a high price-to-weight ratio such as spices (pepper, nutmeg, cloves, mace, etc.), silk, and cotton cloth. Southeast Asia benefited from its location, as trade routes between India and China passed through the region. Some basic commodities such as rice, dried fish, and salt were also traded, mainly within the region.

Most of Southeast Asia's trade around 1750 was conducted by Asian merchants, who had been joined for this purpose by European-chartered trading companies, particularly the Vereenigde Oost-Indische Compagnie (VOC, Dutch East India Company). The Spanish were active only in the Philippines (which was an entrepôt for shipments of silver primarily from Mexico to China and of silk and porcelain from China to Europe). The Portuguese, English, and Dutch had established trade strongholds throughout Asia. During the nineteenth century an increasingly dense shipping network spanned the region, with the ports of Rangoon, Belawan, Penang, Singapore, Bangkok, Cholon, Danang, Haiphong, Manila, Makassar, Banjarmasin, Tanjung Perak, and Tanjung Priok as nodes.

In the late nineteenth century, industrialization in western Europe and North America spurred world trade as the export of commodities to these continents became more important than intra-Asian trade, and production for export itself diversified. Southeast Asia's exports increased beginning in the mid-nineteenth century, but the per capita level was still low by 1914 compared to Western countries, and Southeast Asia still occupied a marginal position in global trade. The impact of foreign trade on economic development was further limited by the fact that most countries had a trade surplus. The surplus paid for the overseas remittances related to the accumulating inflows of foreign direct investment and loans as well as the employment of foreign nationals before World War II. This is often referred to as the "colonial drain."

After 1870 the export mix of Southeast Asia changed toward bulk products. Facilitating this shift was a decline in long-distance transport costs as a consequence of the construction of railways and of increasingly larger steamships.

The opening of the Suez Canal in 1869 reduced the need to ship goods around the Cape of Good Hope. The Suez Canal also benefited trade with North America, most of which went to America's eastern seaboard via Europe until the construction of transcontinental railways in the United States and the opening of the Panama Canal in 1915.

The increasing trade of bulk produce—such as rice from Burma (Myanmar), Siam (Thailand), and South Vietnam; sugar and copra from Indonesia and the Philippines; and rubber from Malaya—benefited more from technological changes in shipbuilding and organizational changes in the international shipping industry. The shift from sailing ships to ships propelled by steam increased the speed of travel. Ships no longer depended on the wind or on the season of the year (important for crossing the Indian Ocean). Steam engines became so powerful that they could propel increasingly larger steel ships, which soon replaced wooden vessels on long hauls. By 1914, international shipping costs had declined to about one-fifth of their 1850 level.

The Macartney Mission/Embassy to China

In September 1792 an embassy from Great Britain under George Viscount Macartney (1737–1806) set sail from Portsmouth for China with the hope

of making agreements with the Chinese emperor to establish diplomatic relations and increase trade. After nine months at sea the entourage of 95 people landed at Macao, then a Portuguese territory, and proceeded north, eventually reaching Jehol, the imperial retreat, where Macartney would have an audience with the Qianlong emperor (r. 1736–1795) on September 14, 1793. The embassy remained in China until the end of the

› GIFTS FOR THE EMPEROR

James Gillray's satirical print, "The Reception of the Diplomatique and His Suite," was published in 1792, a week before Macartney's actual departure for China. (Hulton-Deutsch Collection/Corbis)

The gifts that Macartney would present to the Chinese emperor on behalf of George III were the subject of serious consideration, as they were designed to introduce British ingenuity to the Chinese. The final cost was a staggering £16,000, well above the initial budget of £10,000. These gifts became well known through the popular press. In 1792 James Gillray satirized the anticipated meeting between Macartney and the Qianlong emperor in his *Diplomatique and His Suite at the Court of Peking*, which was published one week before the embassy sailed. Here Gillray depicts an eager ambassador on bended knee presenting not objects that represented significant scientific and technological achievements but rather trivialities—such as a badminton racquet and shuttlecock—to a mildly interested emperor lounging on a cushion and smoking a long, slender pipe.

—Cathy Pagani

year, arriving back in England in September 1794. The main aims of the embassy were to negotiate a treaty that would allow a representative of the king of England to reside in Beijing, obtain a piece of land near the tea- and silk-producing areas in southern China where British merchants could establish a permanent year-long residence under British jurisdiction, and open new ports for trade, particularly in northern China, where British goods—most notably woolens—could be sold. In addition, Macartney had been charged with obtaining as much information as possible about the Chinese and their relations with other nations. He was also to create a favorable impression of the British with the Chinese ruler not only through the ambassador's good conduct but also by demonstrating Britain's ingenuity in scientific and technological achievements. This was one of a number of European embassies sent to the Chinese court in the eighteenth century and was the first embassy sent by Great Britain. An important part of the embassy was the choice of gifts for the emperor on behalf of King George III. Owning to the embassy's significance in establishing diplomatic relations, much attention was spent on the selection, care, and reception of the gifts. The clocks, terrestrial and celestial globes, muskets, woolens, and other items were designed to impress upon the Chinese the superiority of British manufactures—and, by extension, British cultural superiority—and to create a market for them in China. The emperor remained unimpressed and in his letter to George III wrote that he had “never valued ingenious articles” nor did he have “the slightest need” for Britain's products.

While Macartney was successful in meeting with the Qianlong emperor, the embassy overall was regarded as a failure and a national embarrassment. Not only did Macartney fail to reach his goal of increasing trade with the Chinese, but he alienated the Chinese ruler during the infamous Kowtow (*ketou*) Incident by refusing to prostrate himself before the emperor during his first audience with him. The embassy failed to understand that the kowtow was an important part of Chinese court protocol; the Chinese considered this a sign of disrespect that reinforced their view of the British as arrogant and ill-mannered. The British were, to the Chinese, ignorant barbarians.

In the end, the Macartney embassy did little to change the Qianlong emperor's perception that Britain was nothing more than a tributary nation that was sending a congratulatory entourage in honor of his 80th birthday. More importantly, it served to highlight the cultural misunderstandings that existed between the British and the Chinese at the end of the eighteenth century.

Opium War and Trade with China

The Opium War of 1839–1842, one of the most dramatic encounters between China and the West, resulted from the Qing government's efforts to end the British-controlled opium trade. For the British, the war was not simply the result of trade disputes but also served as a means of asserting superiority over China after the failure of the embassies of Lord Macartney (1737–1806) in 1792–1793 and then Lord Amherst (1773–1857) in 1816. The Chinese were no match for British firepower and were handily defeated. The war ended on August 29, 1842, with the signing of the Treaty of Nanjing, which expanded the Westerners' control of the China trade.

Opium is a highly addictive narcotic that comes from the opium poppy, *Papaver somniferum*, and was first used in China as a medicine as early as the eighth century. In the late

seventeenth century the Chinese began to smoke tobacco steeped in opium and by the late 1760s were smoking pure opium. The habit grew rapidly, affecting all strata of Chinese society. Although China produced its own opium, smokers preferred the stronger foreign product grown in the Indian regions of Bengal and Malwa.

Opium became an important product in the trade involving England, India, and China. England had developed an insatiable demand for Chinese teas that was not counterbalanced by the Chinese need for British goods. In the eighteenth century the Honourable East India Company, which had traded with China since 1600, began to help finance its purchases of tea with Indian opium grown in areas under British control. In the late eighteenth century China was importing about 1,000 chests of opium annually (a chest weighs approximately 133 pounds or 60 kilograms); by 1838, imports totaled around 40,000 chests. Estimates put the number of smokers in the early 1830s between 2 million and 10 million. This profitable business soon attracted private traders at Guangzhou (Canton) as well.

The Chinese government made several attempts to stop the trade in opium. An edict of 1729 prohibited the selling and smoking of opium, and in 1796 the government prohibited its importation and domestic production. These edicts were ineffectual and instead encouraged smuggling of the drug, as foreign dealers were loath to give up the trade's high profits.

In 1839 the emperor appointed Lin Zexu (1785–1850) as imperial high commissioner at Guangzhou to deal with the opium situation. Lin's orders to stop the smuggling were ignored by the foreign dealers; in one final attempt to control the situation, Lin cut off food and water supplies to the foreign factories and destroyed 20,000 chests of opium. The British fled from Guangzhou, moving first to Macao and then to the largely uninhabited island of Hong Kong, where they would continue trading with other Chinese ports. On November 3, 1839, following a fierce confrontation between Chinese junks and British warships, Britain declared war. The Chinese were outmatched by the British naval forces, which quickly took command of strategic locations along the coast and formed a blockade of the Guangzhou estuary. When the British

British ships bombard Guangzhou Harbor during the First Opium War, which started after the Chinese resorted to force to halt the importation of opium by British traders. (Hulton Archive/Getty Images)

➤ SMOKING OPIUM

Smoking opium required special paraphernalia. The primary pieces of equipment were the opium pipe, the lamp, a spoon-headed needle, and a box to hold the treacle-like prepared opium. The opium pipe had a long stem with a detachable bowl in the shape of a flattened sphere. To take opium, the smoker had to lie down with his (or her) head resting on a pillow. Using the needle, the smoker would take a pea-sized ball of opium and hold it over the flame of the lamp. Once the drug began to bubble, it was quickly placed into the small opening of the pipe and inhaled in one long breath.

—Cathy Pagani

took Shanghai and threatened to attack Nanjing in mid-1842, the Chinese admitted defeat. With the signing of the Treaty of Nanjing on August 29, 1842, the Chinese were forced to cede Hong Kong to England, open Guangzhou and other ports for trade, and pay more than 21 million dollars in silver to the British to cover the cost of the destroyed opium. With Britain in control of the trade, great quantities of opium continued to be imported into China until the end of the nineteenth century. It was not until 1997 that Hong Kong was returned to Chinese governance.

Western Traders and the Opening of China

In the mid-eighteenth century, Chinese trade with western Europeans was a very small part of the rapidly expanding Chinese commercial networks. Existing interstate trade was thriving. Caravans carrying Russians, Swedes, Manchus, Mongols, and Chinese crossed through the steppes even during wars. China had complex trade relations with many Asian states, such as Japan, Korea, Burma, Thailand, Vietnam, and the Ryukyu Islands. In 1796 there were over 1,000 oceangoing junks based in Amoy alone.

The armed traders from western Europe did not fit easily into the Chinese networks, but the “red-haired barbarians” were persistent. In the mid-seventeenth century British ships joined other Europeans, trading from Guangzhou (Canton), Xiamen (Amoy), and Zhoushan (Chusan). By 1699, British trade operations centered in Guangzhou. The Qing relaxed restrictions on coastal trade for a while beginning in the late seventeenth century. In the absence of strict government control, in 1720 the Chinese merchants of Guangzhou organized in an effort to manage foreign trade and protect their interests. This sort of organization was becoming common in China by the early eighteenth century. Chinese guilds (perhaps more appropriately described as trade associations) existed at least by the sixteenth century. Europeans knew the merchant guilds as *hongs* or *cohongs*. The term *hong* (*huang* in Pinyin) refers to the association, and the term *cohong* (the British pronunciation of the *gonghuang*) indicates that the Qing bureaucracy officially recognized the group. In 1754 the Qing made the Guangzhou association

responsible for ensuring that Europeans paid transit dues. The Qing also held the Guangzhou *gonghuang* responsible for making restitution for any damages that might arise from foreign merchants' behavior.

The British East India Company (EIC) held a monopoly on the British trade in Asia and maintained military forces, including warships. They could also generally expect support from the British Royal Navy if necessary. The dynastic and trade wars of Europe spilled over to the European merchants in Asia. By the mid-eighteenth century the EIC was clearly dominant in the area, although very mistrustful of the Portuguese and French Jesuits ensconced in the Qing court. The strong European market for Chinese imports inspired traders to push hard on China's door. In 1759 the EIC tried to better its position in trade matters by sending a Mandarin-speaking company trader, James Flint, to carry to the court requests for an expanded access and to present their grievances about Chinese merchants. He sailed up the coast in a small ship and gained an audience with the Qianlong emperor through ingenuity and a certain amount of bribery. At first the Qianlong emperor seemed to be receptive to Flint's arguments and agreed to investigate the conditions in Guangzhou. As Flint embarked on an overland return to Guangzhou, the emperor reconsidered the case—perhaps at the urging of the minister of commerce—and ordered Flint arrested. Ultimately Flint's trip accomplished little other than irritating the court and resulted in his imprisonment for three years. In 1760 Qianlong confined all European trade to Guangzhou.

The British resented the restrictions, but the “China Trade” was becoming increasingly important in Great Britain. In the early days silk was the most important trade item, supplemented by porcelain and small amounts of tea, but the tea trade escalated rapidly. In 1701, 120,000 pounds (54,430 kilograms) of tea were imported in Britain; in 1721 over 1 million pounds (453,000 kilograms) were imported; and by 1790 the number had soared to some 20 million pounds (9.1 million kilograms) and continued escalating, reaching 25 million pounds (11.3 million kilograms) by 1800. Drinking tea had become an important social ritual in Great Britain, gradually replacing

ale as the preferred drink with breakfast and midday meals. Tea gardens and such events as tea dances became popular with the upper classes, but tea drinking itself transcended class lines. In fact, some were concerned about laborers drinking tea rather than calming ales during their workdays. Tea drinking (and taxation associated with the sale of tea) spread throughout the British Empire. The American colonists' 1773 protest over tea taxes, the Boston Tea Party, is an important feature of American lore.

The very success of the trade became a problem. There was a small erratic market for British metals and cotton fabrics, and British jewelers briefly tempted the Chinese with ornate music boxes, but within a short time the limited market for such novelties was satisfied. The Chinese were primarily interested in acquiring silver. Both China and Great Britain had monetized economies and depended on silver for large-scale transactions. The Chinese required silver for payment of taxes. Competition for silver and the British traders' search for other trade items set the two states on a collision course. For many years the value of silver bullion in China exceeded the mint price in Britain, meaning that there was a greater incentive for people to invest their silver in trade with China than to sell their silver to the British for coinage. Rather unscrupulous entrepreneurs further devalued British coinage by shaving silver from the edges of coins. They melted the scrap silver for sale in the Chinese markets.

The EIC finally found a trade item interesting to the Chinese when they conquered the opium fields of Bengal in 1756. The Qing had already prohibited opium importation in 1729, but the ban did not deter the EIC, which contracted with country traders (non-EIC merchants licensed to trade in the region) to actually carry the opium to China. The Qing intensified the penalties in 1796 and again in 1813 but to little avail. EIC records indicate that the annual opium trade with China in 1790 amounted to about 4,050 chests (approximately 133–135 pounds [60 kilograms] each). By 1838 that amount had grown to an estimated 20,620 chests annually. Prior to the emergence of the opium trade, silver constituted fully 90 percent of China's imports from European sources. In the early nineteenth century,

opium from Bengal tipped the balance in favor of the British; in 1836, the Chinese spent nearly 10 percent more silver on opium imports than they earned from exporting goods.

British concern about maintaining a favorable balance of trade was the driving force for the two nineteenth-century wars declared against China by the British, the Opium War (1839–1842) and the Arrow War (1856–1858). Among other provisions, the Treaty of Nanjing (1842) after the Opium War resulted in the abolition of the cohong system in Guangzhou and opened five new treaty ports. The volume of British trade doubled. A few years later a new series of treaties followed the Arrow War. In the final version of the Treaty of Tianjin (1858), foreign diplomats of Britain, France, and the United States gained the right to travel to Beijing. Traders and missionaries from those countries could move about freely in the interior of China. Ten additional ports opened to foreign ships, the opium trade was legalized, and Chinese citizens working with foreigners gained the right to be tried under the laws of their employers' courts rather than under Chinese laws. In the Treaty of Aigun (1858), China granted Russia vast territories in eastern Siberia and navigation rights along several internal rivers. This series of treaties and concessions between 1842 and 1860 opened China to foreign traders and largely left those traders and their associates outside Chinese control. The Qing court considered them temporary accommodations, but the foreign governments did not.

Thinking about Trade—Free Trade and Protectionism

The terms “free trade” and “protectionism” refer to two different economic policies about international trade. Specifically, the term “free trade” indicates a policy that advocates the free exchange of goods between countries. Conversely, the term “protectionism” refers to a system designed to protect domestic economies by means of tariffs on imports and subsidies to produce goods for export.

The roots of the doctrine of free trade can be traced back to Adam Smith (1723–1790), the Scottish moral philosopher and political economist. In *The Wealth of Nations*, published in 1776, Smith provided the intellectual foundations for the doctrine’s premises and future developments. Through a reexamination of mercantilism, the economic system that had prevailed in Europe since the sixteenth century, and a critique of government regulation and control of economic affairs, Smith concluded that a system of free trade would bring about the best results for both the consumer and the producer

and would ensure the most advantageous use of society’s resources.

Smith’s views about trade were developed and further elaborated on by David Ricardo (1772–1823), the English political economist, in his *Principles of Political Economy and Taxation* (1817). In his well-known “law of the competitive advantage,” Ricardo took as a point of departure Smith’s considerations of the natural advantages that one country has over others in producing specific goods. The economic system suggested by Ricardo was a system of complete free trade in which each country employed its natural resources to produce those commodities that could give it an advantage over other competing countries in the international market.

The doctrine of free trade as enunciated by Smith and Ricardo was applied in Great Britain during the debates on the Corn Laws, which peaked in the 1840s. The Corn Laws, approved by Parliament in 1815 and 1828, imposed a duty on imported corn (the British term for any cereal crop). Supporters of free trade organized themselves into the Anti-Corn Law League, led by Richard Cobden (1804–1865), a manufacturer and politician, and John Bright (1811–1889), a Liberal member of Parliament. From this organization stemmed the so-called Manchester School, a name given to the group of economists, businessmen, and lobbyists who campaigned in England in the mid-nineteenth century for free trade. The repeal of the Corn Laws in 1846 is usually considered the beginning of an era of free trade in Great Britain. However, the first signs of a shift toward a more liberal economic policy had already occurred in the previous decades. For instance, the abolition of the East India Company’s monopoly over Indian trade in 1813 and Chinese trade in 1833 both anticipated the shift toward free trade.

During the nineteenth century many countries followed Britain’s lead in adopting economic policies based on free trade. In France the so-called French Liberal School promoted, on the basis of the theory proposed by Jean Baptiste Say (1767–1832), economic policies focused on free trade. This school can be considered the French equivalent of the Manchester School. France officially adopted free trade in 1860, and other countries soon followed. Beginning in the late 1870s a number of European countries, with

➤ RICHARD COBDEN—ADVOCATE OF FREE TRADE

Richard Cobden (1804–1865) was a prominent English businessman and politician best known as a fervent supporter of free trade and a member of the Anti-Corn Laws League. He advocated economic and trade policies that bolstered free exchange of products and reduced tariff walls by lowering customs duties. Cobden used Adam Smith’s work as a point of reference to theoretically support his views and ideas about international trade. Cobden was also the promoter of the trade agreement between France and Great Britain, generally known as the Cobden-Chevalier Treaty (1860), that aimed at bringing down trade barriers and fostering the exchange of goods between the two countries. Apart from his involvement in the free trade movement, Cobden supported and patronized a number of important social and cultural initiatives both nationally and internationally. He was a convinced pacifist who openly deplored war and promoted the reduction of armaments.

—Antonella Viola

the exception of Great Britain, the Netherlands, and Belgium, reestablished protective tariffs during a period of economic recession. But the tariffs tended to be modest and did not present a serious impediment to the exchange of goods across European borders.

In much of Asia, free trade accompanied European colonialism. Britain imposed free trade on its Indian colony, and Britain and other Western powers forced Japan, Korea, and China to maintain low tariffs through a series of “unequal treaties” imposed in the nineteenth century. Most Latin America states, with their economies based on the export of agricultural products and raw materials and the import of European-manufactured goods, also became wedded to free trade from the 1860s onward.

In the United States free trade had less support than in Europe. In 1791 Alexander Hamilton (1757–1804), then secretary of the treasury, in his “Report on Manufactures” proposed to safeguard U.S. industry and trade by means of tariffs and duties. Protectionism remained the guiding principle in the United States until World War I and beyond. Canada also adopted a high-tariff policy in 1879, when the government of the Conservative leader John A. Macdonald implemented its National Policy. Beginning in the late 1890s Canada, New Zealand, Australia, and South Africa adopted a two-tiered tariff system in which Great Britain and trade partners within the British Empire received preferential treatment.

In the 1920s tariff protection basically remained at the same levels as in the pre-World War I economy, but this changed with the onset of the Great Depression. The passage of the Smoot-Hawley Tariff by the United States in 1930 led to a storm of foreign retaliatory measures that prolonged the depression by causing a drastic decline in international trade. After World War II, international economic planners and government leaders sought to correct the problems stemming from the protectionism of the interwar years. Multilateral trade agreements and other forms of economic cooperation led to the General Agreement on Tariffs and Trade (1947) and laid the foundation for the World Trade Organization (1955), designed to supervise and liberalize international trade.

Latin America's Export Boom in the Late Nineteenth Century

In the late nineteenth century, Latin America's economy experienced an unprecedented export expansion in response to the growing demands for food and raw materials from industrialized Europe and North America. To supply the increased demand for rubber, sisal fiber, bananas, sugar, coffee, cotton, frozen meat, and grains as well as minerals such as nitrates, copper, tin, and silver, European (chiefly British) and North American commercial interests entered and became the dominant factors in the economies of Latin American countries. These commercial interests built railroads and established steamship lines to efficiently move these products to Latin American ports and from those ports to North American and European markets; acquired land and established plantations to produce sugar, bananas, coffee, and other tropical foods; developed mines to extract not only metals and nitrates but also guano (for fertilizer); built company towns to house and control their workforces; used their size and power to influence and frequently corrupt policies of Latin American governments; supported the overthrow of governments and the installation of other governments friendlier to their policies; and used their economic power and political influence to control diplomatic and military relations between the producing countries of Latin America and the consuming nations of North America and Europe.

The late-nineteenth-century export boom illustrates all of these developments. Tropical America had exported sugar since the early sixteenth century. Sugar production had constantly increased decade after decade until, by the mid-nineteenth century, sugar comprised a large part

➤ EXPORTS, DEPENDENCY THEORY AND WORLD SYSTEMS

Latin American economies (except for that of Brazil in recent years) were characterized as colonial economies because the crucial decisions that affected their economies were made in the United States and Europe. Exports from Latin America were products of their farms and mines; their imports were finished manufactured goods. With their economies dependent on the economies of the United States and Europe, Latin Americans had little control over the prices of the goods and commodities they sold or bought. Latin America's historical economic dependence inspired some scholars, such as Andre Gunder Frank (*Capitalism and Underdevelopment in Latin America*; London: Penguin Books, 1971), to develop Dependency Theory, a set of ideas that complement World Systems Theory (see Immanuel Wallerstein, *The Modern World System: Capitalist Agriculture and the Origins of the European World Economy in the Sixteenth Century*; New York: Academic Press, 1974). World Systems Theory holds that the modern economic world is divided into a developed, relatively wealthy Core (North America, Western Europe) and the less wealthy Periphery (Latin America, Africa, most of Asia). The world economic system, according to both Dependency and World Systems theories, is so structured that wealth flows from the undeveloped Periphery to the developed Core. The Periphery finds it difficult to escape its endemic poverty.

—Wilfred J. Bisson

of the caloric intake of North Americans and Europeans. By the mid-nineteenth century Cuba was the leading exporter of sugar, followed by Brazil. In the 1870s Cuban and, to a lesser extent, Brazilian sugar production came to be dominated by heavily capitalized *centrales*, enterprises that contracted with plantation operators (*colonos*) to buy their cane and produce the refined sugar in huge steam-driven crushers. The plantations were often connected to the *centrales* by narrow-gauge railroads and were obliged to sell their product at prices dictated by the *centrales*. The production of sugarcane provided only seasonal employment for most of the plantation laborers; in the rainy season (the

tiempo muerte), poverty and unemployment stalked the sugar-producing regions. By the 1890s many of the Cuban *centrales* were owned by North American interests, and the United States was the largest market for Cuban sugar. In the early twentieth century U.S. customs regulations gave Cuban sugar a favored place in the U.S. market.

North American interests came to dominate Latin American production of bananas and other tropical fruits in a similar fashion. Here the major but not the only North American enterprise was the United Fruit Company. United Fruit evolved from a company that had been compensated by the Costa Rican government for the construction of a railroad (1870s) by the grant of about half a million acres (200,000 hectares) of idle land. This erstwhile railroad company established banana plantations, company towns, and shipping facilities. By the turn of the century, United Fruit operated plantations on millions of acres in many Central American countries as well as in Colombia and Ecuador. During the U.S. military occupation of Cuba (1898–1901) United Fruit acquired half a million acres in Cuba. To protect its vast landholdings from taxation and to ensure assistance of local governments in the control of labor, United Fruit actively intervened in the politics of many Latin American countries, which then acquired the epithet “banana republics.”

Henequen (a type of agave plant) as a source for sisal fiber became the principal export of Yucatan during the 1890s, when the demand for a cheap and durable binder twine for wheat harvesters on the North American plains grew. Special steam-driven machines used to strip the sisal fiber from the henequen leaves were established in large central haciendas. The production of sisal was, for a time, a Yucatan monopoly and caused an economic boom in and near the city of Merida around the turn of the twentieth century. The care and harvesting of the henequen plants was difficult and labor-intensive. To ensure a steady supply of cheap labor in the henequen fields, the regime of Porfirio Diaz conscripted Yaqui Indians from northern Mexico for forced labor, akin to slavery, in the Yucatan henequen fields. Mexico lost its monopoly in sisal production when German scientists early in

the twentieth century, using stock from Florida, introduced henequen cultivation to Tanganyika (then in German East Africa). After the great haciendas were broken up following the Revolution of 1911–1920, Mexican production diminished rapidly.

The rubber boom in Brazil mirrored the sisal boom in Mexico. The rubber tree, the sap of which, latex, is the raw material for rubber, is native to the American tropics. In the 1870s American and German chemists developed processes by which rubber became the ideal material for use in rubber tires. With the proliferation of bicycles and automobiles, rubber came to be in high demand, and the Amazon basin of Brazil was the easiest place to get it in quantity. Brazilian merchants controlled the production end of the commerce. They employed immigrants from the poverty-stricken northeast of Brazil, sending them into the Amazon jungle to tap the widely scattered rubber trees. The tappers were employed in a system that was a form of debt peonage resembling slavery, but the rubber barons who controlled the commerce grew extremely wealthy. The Amazon ports of Manaus and Belem became large sophisticated cities with conveniences such as electric streetcars and streetlights that were rare in most other Brazilian cities. But the prosperity of the rubber boom was ephemeral. By 1912 the British had developed rubber plantations in their colonies in Southeast Asia that could produce rubber less expensively and with a more consistent quality. This spelled the end of the Brazilian rubber boom.

Southern Brazil's economy expanded with the boom in coffee, and São Paulo, in the heart of the coffee-producing region, became the largest city in South America. But the prosperity in coffee became a depression as overproduction caused the price of coffee to plunge. Brazil's cotton and other agricultural crops were likewise exposed to the vagaries of the boom and bust cycles in the fluctuating world market.

Argentina and Uruguay's late-nineteenth-century prosperity, like that of Brazil, was also fueled by agricultural exports, mostly beef but also wheat and maize. Shipping refrigerated beef to Europe began in 1876, leading to a significant improvement in and expansion of the livestock industry of the Argentine and Uruguayan

pampas. This expansion was accompanied by the injection of large amounts of British capital to build railroads and shipping facilities. Large-scale immigration, mostly involving Italians and Spaniards but also Germans, British, and Irish, flowed in, making Argentina and Uruguay the most "European" of all the Latin American republics.

Latin America's export of minerals also soared in the late nineteenth century, with tin dominating Bolivian trade and nitrates and copper playing a similar role in Chile. The competition for the nitrates of the Atacama Desert, avidly sought by fertilizer and munitions manufacturers in Europe and North America, contributed to causes of the War of the Pacific (1879–1884). In this war Chilean armed forces seized from Bolivia and Peru most of the 43,000-square-mile (111,370-square-kilometer) Atacama. Chile won the control of the nitrate beds, but the prosecution of the war in the Atacama produced strains in Chilean politics that plunged Chile into one of its rare civil wars.

The late-nineteenth-century Latin American export boom led to the development of large cities to serve as ports. The boom also brought the conveniences of late-nineteenth-century urban living to some of the population in these growing port cities and stimulated a great wave of European immigration, especially by Iberians, Italians, and Germans, to Argentina, southern Brazil, and Cuba. But the export boom, by increasing the power of European and North American capital in Latin America, kept the Latin American economies in a state of dependence to North American and European interests.

The Global Diamond Trade

The idea that gem-quality diamonds are articles of priceless value and peerless emblems of natural beauty, purity, and rarity is relatively new. Prior to the seventeenth century, the diamond trade was negligible in East Asia, sub-Saharan Africa, the Americas, Russia, and northern Europe. Although China was familiar with the commodity, diamonds were not valued beyond their ability to engrave and shape jade. This remained the case up until the late nineteenth century. In South Asia and the Middle East, however, diamonds as well as rubies, enamels, precious metals, emeralds, and other minerals had been an important part of elite material culture since the times of antiquity. Rulers adorned themselves with these items to create an image of power, wealth, and status. European elites appropriated these techniques of creating spectacles of authority and along with them veneration for precious gems. By the medieval period in Europe, diamonds were known to be among this pantheon of esteemed minerals, but not until the late eighteenth century did

diamonds come to be viewed as the undisputed “monarchs” of the gem world.

In 1750 David Jeffries, a merchant and jeweler based in London, identified a crisis in the diamond market. Before the 1730s, Golconda, in south-central India, was known as the only source of diamonds. Indian monarchs controlled production levels to balance demand with supply for favorable prices; during the seventeenth century, Indian production reached its zenith. The diamond market changed after 1728, when diamonds were discovered in Brazil. After New World stones flooded the market, diamond prices plummeted. By 1750 Jeffries had concerns that the market would never recover, but he rightly anticipated how interested wealthy and powerful Europeans were in a commodity that was relatively cheap and had an aura of luxury while at the same time celebrating European dominance in South Asia, notions of ancient privilege, and the modern science of light and diamond-cutting technology.

European monarchs and aristocrats covered themselves in diamonds. Catherine II of Russia, a self-styled Enlightenment monarch, had crafted for herself the Great Imperial Crown, composed of 4,936 diamonds. Large diamonds famous in Indian histories were particularly prized as European monarchs scrambled to assemble for themselves seemingly ancient crown jewels. Britons in India, many of them servants of the East India

► THE KOH-I-NOOR

In 1850, the East India Company gifted the Koh-i-Noor or “Mountain of Light” Diamond, an artifact previously held by the defeated Sikh leader Ranjit Singh, to Queen Victoria of Britain. During the months it took to transport the diamond to London from the Punjab, the British press tantalized readers with tales of how the piece had figured prominently in Indian and Persian histories. Rumors emerged about its immense worth and talismanic or cursed nature: it was said that whoever possessed the diamond was unconquerable or, conversely, doomed. The diamond went on public display in 1851 at the Great Exhibition as a celebration of Britain’s monarchy and imperial conquest of India. Crowds rushed to see it and were summarily disappointed; the piece did not

conform to British imaginings of how it would look. People complained that it was too small and too dull and was not cut in keeping with European diamond fashions. The unveiling turned out to be an embarrassment, and Albert, the prince consort, had the large diamond recut in European style, a process that removed about half its size. Instead of figuring prominently in the Crown of State for Victoria, the diamond was kept as one of many in the crown jewels, most of which were acquired in the nineteenth century. Despite postcolonial claims made on it by India and Pakistan, the Koh-i-Noor remains the property of the British monarchy today, usually reserved for the use of the ruler’s (female) consort or mother.

—Danielle Kinsey

Company, remitted gems back to London to pay off personal debts; soon London was the capital of the diamond trade, a position that arguably it has never lost.

Events such as the French Revolution in 1789 and the impeachment of Warren Hastings, the first governor-general of Bengal, for alleged corruption in 1787 evoked a popular criticism of diamond consumption as emblematic of debauched government. Likewise, influential economists such as Adam Smith condemned diamond production and consumption as irrational. As elites moved to sell their jewels during the Napoleonic Wars (1799–1815), prices plummeted. This downward swing in the market coincided with the exhaustion of Indian mines; after 1820 Brazil was the world's only major producer of uncut diamonds, although most Europeans continued to associate them with “the Orient.”

The market changed forever after 1869 with the discovery of diamonds in South Africa. Miners seasoned by gold rushes in the Americas and Australia converged on Kimberley in the 1870s, producing quantities of diamonds as never before. European and now American markets were able to absorb great quantities of diamonds during this time largely because the appetite of “respectable” middle classes for midmarket jewelry had been cultivated by dozens of international exhibitions, beginning with London's Great Exhibition of 1851.

In South Africa in 1881 Cecil Rhodes and other partners formed the De Beers Mining Company; by 1889 it controlled 90 percent of the world's uncut diamonds and had created what remains the most successful cartel in history. By assuming leadership positions within the British colonial government and cultivating support within the imperial government in London, Rhodes channeled the development of South African politics and infrastructure toward

bolstering the diamond industry. This is seen in the “illicit diamond buying” legislation in both South Africa and Europe, which illegalized much of African participation in the market, as well as in the development of diamond mining compounds, facilities that interned mine workers 24 hours a day. Recent scholarship has revealed how these compound labor policies eventuated in South African apartheid politics.

By the close of the nineteenth century, diamonds had become an acceptable part of middle-class material culture. Diamond jewelry was particularly associated with wedding rituals, especially as wedding gifts and engagement rings. By 1914 American consumers commanded the major market share, while Asian and South American markets emerged. The De Beers Company maintained its monopoly and in the 1930s unveiled what was to become one of the most successful advertising strategies in history, the “Diamonds Are Forever” campaign alongside De Beers's diamond engagement ring.

■ Introduction: Money and Banking

Innovations related to money and banking helped transform the world's economy between 1750 and 1914. Nations and empires benefited from the establishment of stable cen-

tral banks, such as the Bank of England, and by the lending capital of large and influential investment banks, some family-owned banks like Rothschild and others joint-stock banks such as

the *Crédit Mobilier* (1852, France). Likewise, the nineteenth- and early-twentieth-century popularity of mortgage banks, savings banks, and post office saving banks served a growing market of the working class. The period 1750–1914 also witnessed serious cycles of economic depression, the consequence of numerous factors including the internationalization of trade and resultant price fluctuations as well as fledgling monetary systems that unwittingly but ironically contributed to economic disequilibrium. For example, the United States remained committed to a bimetallic system of silver and gold throughout the nineteenth century, whereby the standard mint ratio versus the prevailing market ratios of specie heightened the susceptibility of the economy to periodic booms and busts. Finally, public perceptions of monetary and banking policies could likewise lead to political and social discontent and reform, as demonstrated in the United States by Populism, the Sherman Silver Purchase Act (1890), and William Jennings Bryan’s famous “Cross of Gold” speech (1893).

As a medium of exchange, money can assume many forms, varying from coins made of precious metals such as silver and gold to paper instruments such as banknotes, bills of exchange, and checks. The amount of money in circulation versus the amount held in reserve by banks to cover their debts has varied throughout the course of time by national legislation. Likewise, nations have regulated the creation of particular types of banks, ranging from central and national to joint stock and private. These variations make generalizations about money and banking imprecise; however, it is safe to state that many aspects of the modern economic system—as reflected in monetary and banking policies—had their origins in the period 1750–1914. The growing strength of central banks, like that of the Bank of England, is a prime example.

The Bank of England, and other similar central banks, assumed mature form in the nineteenth and early twentieth centuries. Chartered by state governments, they became “lenders of last resort,” to use a phrase of the economist Walter Bagehot (1826–1877). The significance of central banks can be summarized in three general statements. First, they typically became the

official issuers of a nation’s banknotes, pegging their national currencies against gold specie or other regulated standards. Second, central banks set the bank rate, or discount rate, charged to commercial and other banks for loans. These bank rates, in turn, affected the rates of interest that commercial banks charged to their customers. Third, central banks often bought and sold government securities. By manipulating these devices, namely the contraction or expansion of the money supply via banknotes, bank rates, and securities, central banks provided a semblance of order to an economic system that was susceptible to periods of recession and inflation. Leading the way internationally were the Bank of England and the British pound sterling, the latter becoming the preferred method of exchange in international trade in the latter half of the nineteenth century. Also important were the Federal Reserve System of the United States (1913), as well as the *Banque de France* (1800), the *Reichsbank* (1875), and the *Swiss National Bank* (1907).

By 1914, banking and monetary policies had matured considerably but remained conservatively tied to the gold standard. Even the world’s most stable bank of the period, the Bank of England, kept its bullion reserves well above the issuance of its banknotes from the mid-1890s until World War I. World War I necessitated changes, however. To finance the war, the Bank of England and other central banks issued banknotes greater than their gold reserves. After World War I, the impact of the worldwide Great Depression and the influence of economists like John Maynard Keynes would further alter the monetary and banking landscapes.

—Paul A. Tenkotte

English Banks in the Era of the Industrial Revolution

During the Industrial Revolution, banks existed in several different forms and conducted a wide array of activities, including, though not limited to, receiving deposits, making loans, buying and selling bills of exchange, discounting notes, and providing financing to the government. Some types of banks also issued their own banknotes that could circulate as a medium of exchange.

The Bank of England, which served as the banker to the British government, was the most important British banking institution of the era. Founded in 1694, the Bank's primary role was providing short- and long-term financing to the government. The bank engaged in some private banking activities (such as discounting bills of exchange for merchants), but these activities were secondary. The Bank of England's prominence in the banking system was based on holding Britain's gold reserves and the use of its banknotes as the primary means of payment for large transactions in London. During the nineteenth century the bank acquired some of the characteristics associated with a so-called banker's bank, but it could not yet truly be considered a central bank. It had to wait until the late 1870s before it received a monopoly on the issuance of banknotes, and its role as a lender of last resort during the era of the Industrial Revolution is a subject of some debate.

Private bankers were a second type of banking institution in London during the Industrial Revolution. These banks often were founded by persons in professions in which financial intermediation occurred somewhat naturally, including goldsmiths (e.g., Hoare's Bank and Barclays), merchants (e.g., Barings), and scriveners (notaries). It is estimated that between fifty to one hundred such banks existed in the late eighteenth and early nineteenth centuries. These banks performed such functions as providing loans or credit to the upper classes, obtaining loans for governments, and helping finance commerce mainly through the issuance and discounting of bills of exchange. They also served as correspondent agents for country banks outside of London, performing such services for them as discounting bills and holding excess funds.

Country banks, which are similar to the private banks of London, sprang up throughout England and Wales beginning in the mid-eighteenth century. Many of these banks were founded by persons engaged (either currently or previously) in trade (e.g., the slave trader Thomas Leyland established a successful bank in Liverpool), manufacturing (e.g., Lloyds of Birmingham), or tax collecting. Country banks were usually small, but they also were plentiful, with close to 700 existing at their peak. They served as financial

intermediaries between agrarian landowners and small, local manufacturers. The banks also often issued banknotes which could be used as a local medium of exchange. Country banks long have had a reputation of instability and high failure rates during economic crises, such as the crisis of 1825–1826, during which almost ten percent of country banks failed.

The country banks' small size and the inexperience of their managers were seen as the main causes of this instability. For example, many country banks failed for liquidity reasons when bankers holding illiquid long-term assets (such as mortgages) found themselves unable to repay their short-term liabilities. Recent research, however, suggests that the instability and failure of many country banks may have resulted from their practice of intentionally holding relatively risky, illiquid, and somewhat undiversified portfolios in the hopeful expectation that such portfolios would earn higher returns than other safer assets.

During the nineteenth century joint-stock banks (banks owned by stockholders holding transferable shares) began to appear in England, and over time they came to replace the country banks. With the exception of the Bank of England, these banks had been prohibited until 1826, when Parliament allowed them to be established outside of a 65-mile (105-kilometer) radius from London. Typically, joint-stock banks obtained funds through deposits and then used these funds to extend short-term credit to borrowers.

The savings bank was another type of bank that appeared in England early in the nineteenth century. Founded primarily as philanthropic endeavors to encourage thrift among the poorer classes, these banks attracted deposits from the lower and lower-middle classes that were then used to finance government debt.

The size of the country's banking sector grew rapidly during the Industrial Revolution. Bank assets in England and Wales have been estimated to have grown from £20.5 million in 1775 to £54.8 million in 1800 to £80.0 million in 1825, reaching £139.0 million in 1844. Relative to the overall English economy, these figures represent 15.2 percent, 27.9 percent, 29.6 percent, and 34.4 percent, respectively, of annual

English national income—indicating that not only were banks growing larger but that their relative importance in the overall economy also was increasing.

To what extent did banks foster industrialization? Banks typically played little direct role in providing long-term financing of fixed capital assets such as buildings and machines for Britain's industrializing enterprises. In the early stages of the Industrial Revolution, entrepreneurs were able to fund their business primarily by reinvesting retained earnings in the firm or by obtaining personal loans from friends and family. What funding banks did provide was generally short-term credit because banks, without a lender of last resort to whom to turn in times of crises, needed to keep their assets liquid in case deposits were withdrawn or banknotes were returned for redemption. This emphasis on short-term credit should not necessarily be interpreted to mean that banks were not helpful in financing industrialization. The provision of short-term credit for circulating capital (raw materials, works in progress, etc.) freed the owners' own funds that could then be used for long-term, fixed-capital investment. It also was not uncommon for short-term credit to be rolled over, in essence making it longer-term credit, and banks sometimes made loans that were designated to be long-term from the beginning. Additionally, it should be noted that a number of banks did participate directly in industrial undertakings, especially in the iron, brewing, and textile industries. Some banks seem to have been opened specifically to provide financial services for these affiliated firms. The banking system also was instrumental in transferring savings from agrarian regions to industrial areas where they were used to finance the construction of canals, railways, and factories.

Investment Banks

Investment banks of the eighteenth and nineteenth centuries, outgrowths of a financial revolution, were the economic engines of the period 1750–1914. In particular, European banks provided the capital necessary to finance communications, industrial, mining, and transportation innovations and infrastructures not only in Europe but also in Africa, Asia, Australia and Oceania, the Middle East, and North and South America. This was the era of Europe's premier banking families (Baring, Hambro, Hope, Rothschild, Schröder, and Warburg); of U.S. bankers Jay Gould and J. S. and J. P. Morgan; of Britain's "Big Five" joint-stock banking companies (Barclays, Lloyds, Midland, National Provincial, and Westminster); of Germany's Darmstädter, Deutsche, and Dresdner Banks; of France's Crédit Mobilier; of Switzerland's Crédit Suisse; and of Japan's *zaibatsu* banks like Mitsui. In addition, many banking families flourished, including Benson, Bethmann, Bontoux, Fruehling, Germain, Glyn, Goschen, Gurney, Haber, Hansemann, Heine, Hoare, Kaulla, Kleinwort, Lafitte, Lazard, Loeb, Malet, Metzler, Oppenheim, Ouvrard, Overend, Parish, Peabody, Péreire, Raphael, Samuel, Sassoon, Schaaffhausen, Schiff, Seligmann, Speyer, Stern, von Erlanger (later changed to d'Erlanger), and Worms.

Many investment banks had either offices or affiliates in London, which after the Napoleonic Wars supplanted Amsterdam as the principal center of international investment. London's financial importance grew stronger after the

Crimean War and continued unabated until World War I. During the late nineteenth century, the British pound sterling reigned supreme in international trade. European, and in particular British, suzerainty in finance had widespread political, military, and social implications, as Europe gained control of 85 percent of the world's landmass by 1914. Foreign investment assets, totaling \$44 billion by 1913, anchored this imperialism. Great Britain led the investors, followed by France, Germany, and the United States.

Investment banks often traced their origins to a variety of older commercial activities carried on by money changers, goldsmiths, and wholesale traders/commission merchants, all of whom loaned capital to others as a supplement to their original businesses. Some of these merchants eventually began to specialize in banking, giving

rise to the name “merchant bankers.” Religion also played a role in the formation of some of the investment banks. The disfavor of usury, the loaning of money at interest, by both Christianity and Islam had influenced a number of Jewish families to undertake banking. These included the Haber, Oppenheim, Pereire, Rothschild, Schiff, Speyer, Warburg, Worms, and, before their conversion to Christianity, Seligmann and von Erlanger families.

Investment banks of the period should not be confused with the general commercial banks of the twenty-first century that feature a broadly based clientele. Nor were they the savings banks of the nineteenth-century middle class. Rather, investment banks catered to customers ranging from governments and royalty to corporations and wealthy individuals. Their offices

➤ A “WIDGET MAKER” USES THE INVESTMENT BANKING SYSTEM

Imagine that you are a nineteenth-century British manufacturer of widgets. You would like to sell £5,000 (wholesale value) of your widgets to customers all over the world but lack the international contacts to do so. So, you engage a commission merchant in London who agrees to sell on commission your widgets internationally. The commission merchant will handle all of the details for you, buying your widgets and shipping them abroad with goods of his other clients. The commission merchant draws up a bill of exchange or draft (similar to a cheque or check), whereby he (the drawer) agrees to pay a certain sum of money to you (the payee) through his banker, Erlangers in London (the drawee), on a specified date, perhaps three months in the future. You would like some of your money now, however, since you have to pay your factory workers as well as the suppliers of your raw materials. So you take the bill of exchange to Erlangers Bank in London, where the bank accepts the draft. Since the bill is not yet due, Erlangers buys it at a discount from you. Although you do not receive the full £5,000, you are satisfied with the arrangements. You only need a small amount now for current expenses and decide to invest the rest in shares of stock that Erlangers is issuing for one of the railroad subsid-

aries of Cecil Rhodes's British South Africa Company. The bill of exchange, which Erlangers bought from you, can now be resold by the bank to another investor, as its due date is still three months in the future.

In the meantime, your £5,000 of widgets is multiplying money and credit throughout the world. A buyer, or consignee, in British India intends to purchase the widgets and has obtained a letter of credit from his bank proving that he has the financial wherewithal to pay the amount due. This letter of credit is sent to Erlangers in London on behalf of the beneficiary, that is, the London commission merchant. Separate drafts negotiated for payment of the widgets will then be drawn upon this letter of credit and properly endorsed. In three months, or sooner at a discount, the London commission merchant may draw his money from Erlangers and, like you, arrange to have Erlangers invest some of it for him. Meanwhile, the Indian merchant may extend credit to his retailers, who in turn may extend credit to their buyers, many of whom desperately want to buy your widgets. A whole cycle of activity has evolved whereby £5,000 circulates throughout the economy a multiple number of times.

—Paul Tenkotte

were located in the major financial centers of Europe and the United States, namely Amsterdam, Berlin, Brussels, Frankfurt, Geneva, Hamburg, London, New York, Paris, Vienna, and Zurich. Within these cities themselves, the investment banks were centered in financial districts like the City in London and Wall Street in New York.

Investment banks specialized in international trade, government bonds, corporate stock, and bullion/currency trading. They also provided private banking services but mainly as a favor to their customers. Their primary business remained investing and international finance, which hinged upon such fiduciary instruments as letters of credit and bills of exchange as well as stocks, bonds, and loans. For example, Nathan Mayer Rothschild made a fortune issuing British government bonds during the Napoleonic Wars. Rothschild's success depended in part upon his vast network of familial and collegial connections throughout Europe and abroad. His family's bank, like others, floated on a sea of worldwide connections, tied together by their own branch banks in financial centers around the world or by working agreements with affiliate or correspondent banks.

In their financing of governments' territorial acquisitions including the Louisiana Purchase, colonial companies such as the British South Africa Company, canals like the Suez, railroads such as the Baghdad, mines (e.g., coal and diamond), industries (e.g., steel and oil), shipping companies, transoceanic telegraph lines, and trade in commodities ranging from precious metals to textiles to rubber and coffee, investment banks were economic linchpins of nationalism and imperialism. Waxing and waning during periods of prosperity and depression, they were visible markers of an economic system that had evolved during the period 1750–1914 from mercantilism to free trade.

Joint Stock Banks

While historically rooted in seventeenth-century England, modern joint stock banks began to play a decisive role during the nineteenth century. They can be seen as one of the essential institutional innovations that, in combination with technological progress, made the Industrial Revolution possible. As a new way of banking, the unique feature of joint stock banks or incorporated banks, as they are called in the United States, is the way in which they raise their capital. While banks traditionally relied on the personal wealth of the banker, worked with the deposits of their customers, or took out loans themselves, joint stock banks raised their capital mainly by issuing shares. Joint stock banks also introduced several institutional innovations of joint stock companies into the banking world of the seventeenth century: a corporate body, a management structure headed by a director and a board, limited stock owner liability, and the transferability of stock ownership.

Joint stock banks provided mechanisms to mobilize, concentrate, and invest money, thus bridging the gap between available capital and investment opportunities while distributing the risk among a large number of shareholders. At the same time, joint stock banks did not limit their activities to financing new industries but instead began to offer a complete set of banking services, making them available to a broad range of clients through their branch banks. Today,

joint stock banks have become the predominant type of bank and constitute the largest banks worldwide. Thus, joint stock banks can be seen not only as the nucleus of central banks and a key innovation of the period of the Industrial Revolution but also as a cornerstone of modern-day banking services.

There are two main reasons for the invention and spread of joint stock banks. First, joint stock banks were prompted by the financial requirements of early modern states. For example, the first joint stock bank, the Bank of England, was founded in 1694 to manage public debt. In the United States, the Bank of North America, chartered in 1781 by the State of Pennsylvania, became the first incorporated bank and was followed by the Bank of the United States in 1791. Both proved essential for supplying the young republic with money by issuing banknotes circulated as paper currency. Second, an increasing demand for capital spawned by the Industrial Revolution created the need for new instruments of capital accumulation and risk management. Providing loans to private businesses became the main activity of the Bank of Scotland when it was chartered in 1695. In comparison, loans to the government were only allowed under strict conditions. During the late eighteenth century and the first half of the nineteenth century, private commercial banks in the form of joint stock banks evolved in every major industrial country.

Incorporated banks chartered by either individual states or the federal government spread quickly in the United States after the 1790s. Great Britain passed two laws, in 1826 and 1833, that promoted joint stock banks in England and Wales by ending the Bank of England's monopoly as the only joint stock bank and facilitating the creation of such banks all over the country. While joint stock banks were created in Belgium at about the same time, France did not follow until several decades later due to the strict regulation of joint stock companies until 1867 and the strong private banking sector that curbed their expansion. In Prussia, joint stock companies were almost exclusively chartered to promote railway construction before 1870. After that, regulations were relaxed, and joint stock banks began to appear in Germany in large numbers to finance the growth of German industry.

➤ JOINT STOCK BANKING IN ANTEBELLUM AMERICA

Prior to the American Revolution, the British colonies in North America had only possessed a rudimentary banking system. When financial institutions had to be created after the Declaration of Independence, the sale of stocks to accumulate funds proved vital for the infant banking sector of an economy plagued by a chronic scarcity of capital. In 1781 the Bank of North America became the first private joint stock bank with a charter from the Congress of the Confederation, the governing body of the United States from 1781 to 1789. Given that the Bank of North America was a private enterprise bestowed with the functions of a central bank, the antagonism between national and state banking in antebellum American banking can be traced back to this original charter. Based on the ideas of Alexander Hamilton, the First Bank of the United States (1791–1811) and the Second Bank of the United States (1816–1836), the first joint stock banks possessing a federal charter, continued to act as national banks. During the 1830s opposition to their power and influence led by Andrew Jackson terminated national banking. Subsequently, a fast-growing number of state-chartered banks dominated American banking until 1862. As a result, a state-centered banking sector largely consisting of joint stock banks but plagued by bank failures and unsolved currency problems evolved in the United States before the Civil War.

—*Christoph Rass*

Although the ascent of joint stock banks depended in part on the national traditions of banking and specific circumstances, there was a connection between the growing importance of such banks and the spread of the Industrial Revolution.

During this first phase of their growth, individual joint stock banks sprang up in large numbers. Due to a lack of oversight, as was the case during the largely unregulated issue of charters to state banks in the United States between 1811 and 1813 and again between 1834 and 1837, this included a number of ill-managed or even fraudulent enterprises. Beginning in the mid-nineteenth century, therefore, the banking industry experienced consolidation, with only a small number of joint stock banks managing to grow into large

enterprises with networks of branch banks. Joint stock banks also carried new risks. Because joint stock banks in most countries combined limited liability with investing in joint stock companies, financing private companies, and issuing their own banknotes, they risked overstretching their financial capacity and accumulating precarious investments in their portfolios. This became another strong incentive for governments to further develop regulatory controls in the second half of the nineteenth century in an effort to ensure that the free banking system remained viable. Such regulations raised the amount of capital needed to found a new joint stock bank and mandated controls of their business activities through the inclusion of mandatory external members to their boards or the requirement to periodically publish reports.

Gold Standard

Under a gold standard, the value of a unit of currency, such as a dollar, is defined in terms of a fixed weight of gold, and banknotes or other paper money is convertible into gold accordingly. Although the monetary systems of individual countries have been based on the gold standard at times, all the economically advanced countries of the world were on the gold standard for a relatively brief time roughly from 1870 to 1914, sometimes called the period of the classic gold standard.

At the opening of the nineteenth century, no European country was on a gold standard or had developed a gold standard system. England and other countries coined both gold and silver and set the conversion ratio at which gold could be exchanged for silver. England was still officially

on a sterling silver standard, but in the eighteenth century the English government overvalued gold relative to silver, causing an outflow of silver and an inflow of gold and lifting gold to a position of preeminence in England's monetary system.

In normal times, banks redeemed paper money out of reserves of specie (precious metal coinage), but during the wars with revolutionary France and Napoleon, the Bank of England suspended the redemption of its banknotes in specie. After Napoleon's defeat in 1815, Parliament turned its attention to the resumption of specie payments and passed the Coinage Act of 1816. This act placed England definitely on the gold standard, while the rest of Europe remained on a silver or bimetallic standard. In 1819 Parliament passed the Act for the Resumption of Cash Payments, which provided for the resumption by 1823 of the convertibility of Bank of England banknotes into gold specie. By 1821 the gold standard was in full operation in England. Except for England, most countries operated bimetallic systems until the 1870s. Under a bimetallic system, both gold and silver coins circulated as legal-tender mediums.

The English banking system evolved toward the use of Bank of England banknotes as reserves for commercial banks, and the Bank of England became the custodian of the country's gold reserves. The Bank of England learned to protect its gold reserves by adjustments in interest rates, using its bank rate and open market operations to raise interest rates and stem an outflow of gold. Higher interest rates attracted foreign capital that could be converted into gold, and lower interest rates had the opposite effect. Low interest rates were the natural results of a gold inflow.

By the end of the 1870s, France, Germany, the Netherlands, Russia, Austria-Hungary, and the Scandinavian countries were on the gold standard. The bimetallic system became awkward because official conversion ratios between gold and silver often differed from the ratio that existed in the precious metals market. Gold discoveries in California and Australia flooded markets for precious metals, and gold began to replace silver as the circulating medium in France and other European countries. The wars

► THE CRIME OF '73 AND THE CROSS OF GOLD

The Coinage Act of 1873, which informally dropped the bimetallic standard in the United States in favor of the gold standard, caused hardly a political ripple when it passed. However, as deflation gathered force in the late 1800s, the act incurred the wrath of debtors and western farmers and was dubbed the “Crime of ’73.” Debt-ridden farmers and unemployed workmen saw something sinister in removing silver from the monetary standard without a public debate. With vast holdings of silver in western states, coinage of silver could have infused additional monetary reserves in the economy, raising prices and easing pressure on debtors.

The discontent caused by economic depression and the erosion of the bimetallic standard was captured by Illinois congressman William Jennings Bryan in his famous “Cross of Gold” speech at the 1896 Democratic Convention. Bryan’s oratory lifted him from relative obscurity to winning the 1896 Democratic presidential nomination:

“There are those who believe that if you will only legislate to make the well-to-do prosperous, their prosperity will leak through to those below. . . . If they dare to come out in the open field and defend the gold standard as a good thing, we will fight them to the uttermost. Having behind us the producing masses of this nation and the world . . . we will answer their demand for a gold standard by saying to them: You shall not press down upon the brow of labor this crown of thorns, you shall not crucify mankind upon a cross of gold.”

The discovery of new sources of gold in Alaska, Canada, Australia, and South Africa in the late 1890s effectively defused the silver protest, and the Crime of ’73 faded into oblivion. Yet the Crime of ’73 was integrated into the folklore of the United States, including references to it in L. Frank Baum’s *The Wonderful Wizard of Oz*.

—Charles Larry Allen

and revolutions of the mid-nineteenth century again forced governments into issuing inconvertible paper money. Governments often restored convertibility by establishing the gold standard.

If the gold standard had a Golden Age, it was between 1870 and 1914 when it acted as a brake on the issuance of paper money. If prices in Country A rose faster than prices in Country B, residents of Country A would start buying more goods from Country B. Gold would flow out of Country A into Country B, increasing the money supply in Country B and decreasing it in Country A. These money-supply changes lowered prices in Country A and raised prices in Country B. These adjustments restored equilibrium, eliminating the need for further gold flows and stabilizing prices at an equilibrium level.

World War I brought an end to the gold standard, partly because the export of gold was not feasible after 1914 and partly because governments wanted the freedom to print extra paper money to finance the war effort. The end of World War I set the stage for an international scramble for gold as countries tried to

reestablish national gold standards. Britain and France kept their currencies overvalued in terms of gold, hurting the competitiveness of their export industries in foreign markets and causing recessions at home. The classic age of the gold standard had come to an end.

Money Supply

Many aspects of the modern economic system, particularly relating to money supply, had their origins in the period 1750 to 1914. First, it is important to state that money can assume many forms, varying from coins made of precious

metals such as silver and gold to paper currency such as banknotes, bills of exchange, and checks as well as beads, shells, and yams. Second, the amount of money in circulation versus the amount held in reserve by banks to cover their debts has varied throughout the course of time by national legislation. Third, nations have regulated the creation of particular types of banks, ranging from central and national to joint stock and private. In particular, perhaps the most important development affecting money supply during the period 1750 to 1914 was the development and maturation of central banks, like the Bank of England.

The Bank of England, although chartered by Parliament as a private bank in 1694, took more than a century to mature into a central bank. Throughout the second half of the eighteenth century, banks in England issued their own banknotes that were susceptible to periodic runs by creditors demanding conversion of their banknotes for Bank of England notes. The Bank of England, in turn, converted its notes into gold, draining its specie reserves and causing the suspension of specie payments in 1797 (Restriction Act). The 1819 resumption of payment in specie was of international monetary significance, particularly in its recognition that a bank such as the Bank of England could have a tremendous impact on trade, foreign exchange, and the entire economy of a nation. Following an economic depression in the United States and France in 1837 (to which the Bank of England loaned money to avert an international calamity), a bad harvest in England in 1838, and the collapse of a number of British banks in the 1840s, the Bank of England again faced new challenges. In 1844 Parliament divided the Bank of England into two departments: banking and issuing. Further, for all practical purposes, it essentially made the Bank of England the principal issuer of banknotes in Britain. Gradually the Bank of England began to assume powers that made it a central bank in the modern sense, a “lender of last resort” as economist Walter Bagehot elucidated in *Lombard Street: A Description of the Money Market* in 1873. As a central bank, the Bank of England could respond to economic crises through expansions or contractions of the money supply, as the situation dictated. Its tools

were the setting of the bank rate (or discount rate) that it charged other banks as well as open-market operations, by which the Bank of England could buy or sell some of its governmental and other securities on the open market. In the tradition of David Ricardo, the British adopted the “gold specie standard” in 1821, and by the latter half of the nineteenth century, the British pound sterling (redeemable in gold, not in sterling silver as in medieval times) reigned supreme in international trade.

Other nations followed the lead of Britain and established banks that gradually assumed the tasks of central banks. These included the Banque de France (1800), the Banco Español (reorganized 1829, Spain), the Banque Nationale de Belgique (1850, Belgium), the Reichsbank (1875, Germany), the Bank of Japan (1882), the Austrian-Hungarian National Bank (reorganized 1887), the Swiss National Bank (1907), and the Federal Reserve System in the United States (1913). Some nations adopted the gold specie standard, while others pegged their silver currencies to stable ones, such as the British pound sterling, in what was called a gold exchange standard. The United States officially adopted the gold standard in 1900.

By 1914, monetary policies had matured considerably but remained conservatively tied to the gold standard. Even the world’s most stable bank of the period, the Bank of England, kept its bullion reserves well above the issuance of its banknotes from the mid-1890s until World War I. Not until after the war would the impact of the worldwide Great Depression and the influence of economists like John Maynard Keynes alter the monetary landscape.

Bimetallic Monetary System

In the United States, a bimetallic monetary system led to many complications. Alexander Hamilton, the first secretary of the treasury, wanted the United States placed on a gold standard but was unable to do so for lack of sufficient gold reserves. Hence, the U.S. Congress established a bimetallic system in 1792 at a mint ratio of 15:1. That is, a silver dollar was to weigh 15 times as much as a gold dollar, reflective of the rates of exchange of that time. In the 1830s further congressional acts changed this ratio to 16:1. The U.S. Mint practiced unlimited coinage of both metals, meaning that persons could bring their gold or silver to the mint to be made into coins. In addition, the mint allowed convertibility; that is, anyone could convert silver to gold or vice versa at the mint. Unfortunately, the fixed mint ratio did not reflect the fluctuations of the prices of gold and silver in the marketplace, or the market ratio. This was largely because the government could not simply melt down its coins and mint new ones every time the prices of precious metals changed in the marketplace.

The fixed mint ratio and the fluctuating market ratio affected the money supply. If new silver reserves were discovered or new silver mines opened, resulting in a glut of silver in the marketplace, the price of silver, in relation to gold, would fall. If the market ratio fell to 17:1 but the U.S. mint ratio was still at 16:1, then silver would pour into the mint. The scenario would unfold as follows. Wise investors would take their silver to the mint, where they could convert it to more gold (since silver was overvalued at the mint), which in turn they could return to the marketplace and exchange for more silver. They could then repeat the process by returning to the mint to convert this silver to gold, etc. In each transaction, they would be making money at the expense of the mint. Meanwhile, silver would be flowing into the mint, and gold would be draining out of the mint. Interestingly, though, gold

would not be leaving the mint as coins. Why is that? Gresham's law states something rather amazing: the overvalued coinage at the mint (in this case silver) tends to drive the undervalued coinage (in this example gold) out of general circulation. Why does this happen? Several reasons can account for the phenomenon. First, people would not be taking their gold to the mint to make into coins, especially when they could trade it for more in the marketplace. Second, the general population would tend to hoard the higher-valued gold coins as a safety net or investment. Third, banks would likewise retain the gold coins in payment of their own bank notes to their customers. Fourth, gold coins would be exported to pay for imports. Eventually, few gold coins would be minted.

In U.S. history, bimetallism produced some strange results. Between 1792 and 1834 silver was overvalued at the mint, leaving little gold in circulation. In the period 1834 and 1862 the reverse occurred, as gold was overvalued at the mint, and little silver coinage remained in circulation. This situation was exacerbated by the 1849 discovery of gold in California, whereby the market price of gold was further devalued and its mint ratio overvalued. In fact, no silver was brought to the U.S. Mint to be minted into coins between 1849 and 1873. From 1862 (in response to the American Civil War) until 1879, the United States assumed a paper standard, called the greenback period. In 1873 an economic depression ensued, which many citizens blamed on the so-called Crime of '73 (Fourth Coinage Act) whereby the U.S. Congress ended the unlimited coinage of silver. That is, one could no longer bring one's silver to the mint to be made into coins. Supporters of soft money, or inflationists, decried the act and lobbied for the government to mint silver coins. Their influence resulted in the passage of the Bland-Allison Act of 1878, instructing the U.S. Treasury to buy up to \$5 million worth of silver and to mint it into coins. Likewise, the Sherman Silver Purchase Act of 1890 allowed legal tender to be redeemed in either silver or gold.

When the Depression of 1893 began, the silver purchase provision of the Sherman Act was repealed. Between April and December 1893 U.S. gold reserves fell phenomenally, from \$96

million to \$11 million. The presidential election of 1896 became a stage for debates on the issue of money supply between the candidates William McKinley (Republican) and William Jennings Bryan (Democrat). Bryan's famous "Cross of Gold" speech entered the annals of history: "You shall not press down upon the brow of labor this crown of thorns. You shall not crucify mankind upon a cross of gold." McKinley won the election, and in 1900 the United States abandoned the bimetallic system for the gold standard. In 1913 the U.S. Congress established the Federal Reserve system.

Banks and Banking in the Middle East

Modern banks and banking systems were first established in the Arab Middle East in the 1840s—when most of the region was under Ottoman rule—by European merchant houses. During this time, Alexandria, Beirut, and Constantinople became important international commercial centers for foreign companies and local economies. The very first local banks were established in Alexandria by the French and Italian merchant shipping houses of Pastré and Tozzizza as modern alternatives to more traditional banking practices of money lending and money exchange on which the entire financial system was then based. The financial activities of these local banks, however, were limited only to commercial trading between specific parties (often foreign companies). Indeed, it was not until 1856, when the British-owned Bank of Egypt (owners included the London-based East India Company, the Westminster Bank, the Oriental Banking Corporation, and the British Treasury) was established, that modern banking was firmly established in the Middle East. Soon thereafter, the

Anglo-Egyptian Bank was established in 1864 as a competitor to the Bank of Egypt.

In 1867 the Ottomans hastily sought to establish a foothold in Egypt by establishing the Ottoman Bank, which opened its first branch in Alexandria in 1867. It did not, however, enjoy the same level of prestige and influence in Egypt as other foreign-owned banks since its dealings were mainly confined to commercial trading and were distantly controlled from Constantinople. By the 1870s, as the Ottoman Empire became increasingly indebted financially to the European powers, the spread and control of foreign-owned banks grew almost exponentially. The Tokyo-based Yokohama Specie Bank opened its first branch in Port Said in 1870, as did the Paris-based Crédit Lyonnais in 1875. Another French-based institution, Crédit Foncier, started its operations as a mortgage or land bank in Cairo in 1880. Still, a number of locally owned banks did exist in some parts of the region. In Beirut, there was the Banque Alexander P. Haddad, Faroun and Shiha, Robert Sabbagh and Co., and George Trading and Co., while in Damascus, Banque Asfar, Sara and Co., Banque Ernest Asfar, and Siouffi and Sabbagh handled local operations. These local ventures, however, did not possess the resources and capacities of the foreign-owned national institutions and therefore remained largely marginal.

The spread of foreign-owned banking was not just limited to the Arab Middle East, however. In Iran, for example, as British political interests grew, so did the influence of British banks and companies. In 1888 the British-owned New Oriental Bank was the first modern bank to start operations in seven major cities in Iran: Tehran, Mashhad, Tabriz, Rasht, Isfahan, Shiraz, and Bushehr. Shortly thereafter, however, the bank was replaced by the Imperial Bank of Persia in 1889, but its latest incarnation soon expanded operations in the rest of the country and as a result became an important financial institution until the 1950s. The National Bank of Iran (Bank Melli Iran) was the first indigenous bank established in Iran by the order of Majlis (the Iranian Parliament) in 1927. Similarly, in Egypt the National Bank, established in 1898, first emerged as a purely British venture by Lord Cromer and

did not have the power and prestige of a central bank. It was not until 1919 that a group of Egyptian shareholders, led by the prominent financier Mohammed Talat Harb, established a truly indigenous financial institution named Bank Misr (Bank of Egypt).

During this time, most local financial transactions in other parts of the Arab Middle East were still handled by foreign-owned institutions. In French-administered Syria and Lebanon the Banque de Syrie et du Grand Liban simply took over the operations of the by then defunct Ottoman Bank in 1919. The growth and successes of the Egyptian and Iranian banking models, however, served as an inspiration to local pioneers in other Arab and Muslim countries in the

early 1920s. In 1929 a joint delegation of Syrian and Lebanese bankers was dispatched to Cairo to study the successes of Bank Misr. Under the recommendations of the delegation and in cooperation with Bank Misr, the first modern Pan-Arab financial institution, the Banque Misr Syrie Liban, was established in 1930.

■ Introduction: Labor in Industrial Societies

Industrialization brought about not only a revolution in manufacturing methods but also a social revolution as well, as emerging industrialists harnessed new technologies and shaped a new kind of labor force to attain their goal of maximizing output and profit. This process began in the late eighteenth and early nineteenth centuries in Britain and the United States in textile mills that were still water-powered. Textiles and other industries soon turned to coal power, and mechanized factories no longer needed to be situated near rivers, waterfalls, and engineered millraces to provide power. Yet the pattern of drawing labor from poor rural families, not able to sustain themselves, continued with rural migration to cities and new industrial sites worldwide. While manufacture had previously relied on the guild system and the know-how of craftsmen, the Industrial Revolution removed such a crafts-based approach to production. While the workplace still required skilled technicians, the overall trend was toward the deskilling of labor. Over the course of the eighteenth century guild-controlled production gave way to wage labor and the imposed discipline of the workplace.

During the nineteenth century the new industrial order spread through much of Europe, the Americas, and other industrializing regions such as Japan. As the Industrial Revolution progressed, workers had less and less control over design and the pace of work. Crafts-based industry gave way to the repetition of specialized tasks, a goal fully realized in the early twentieth century at the Ford assembly lines in Michigan. Along the way, management wrested nearly total control of production from workers. Industrialists such as Henry Ford could respond to charges of loss of worker autonomy, tedium, and exploitation with the argument that they paid wages that allowed workers to enjoy many of the spoils of the developing consumer society. Nevertheless, unfettered capitalism, with its underlying drive for profits, created an enormous conflict between industrialists and workers that often led to open violence.

Industrial labor, ostensibly a form of free labor, developed against a backdrop of various forms of unfree labor such as slavery, indentured servitude, the apprentice system (essentially a form of indentured labor of apprentices and even journeymen), workhouses, forced

prostitution, and the immigrant work gangs of the *Padrone* system (which drew from Italian, Greek, and Slavic immigrants to the Americas) and coolie labor systems that relied on contracted Asian labor. Free wage laborers often worked in equally oppressive conditions and had little legal recourse. Traditional law favored the rights of business proprietors over employees in matters such as workplace safety, with the burden of risk taking on the worker for entering into a contract of his or her own free will.

Almost universally, industrial laborers worked long hours and six-day weeks with few breaks. Textile factory owners preferred to hire young women who were viewed as easier to discipline. These young women were usually from poor rural areas, unmarried, and “on loan” from their families. This practice was common to the mills of Lowell, Massachusetts, whose owners prided themselves on their paternal protection of their workers, and later in the century the silk mills of Japan, stocked with teenage girls from poor farming families. The silk mill workers in Japan often worked behind barbed wire and were deeply in debt to their employers for transport, housing, and recruiting advances. Immigrant labor often had only narrow semblance of free labor. European miners, recruited as part of the *Padrone* system, for example, worked the copper mines in the western United States, lived in isolated company housing, and were in debt to the *Padrones* who had contracted their labor. Chinese work gangs were treated as dispensable in the building of great public works projects such as canals and railroads. Similarly, as Japan industrialized during the Meiji period, small-scale mining entrepreneurs were forced out of business; mine laborers for newer large-scale industrial concerns slept in crowded sheds with mats and boards set on the bare ground.

Such economic practices contradicted the ideology of the Enlightenment, fostered in documents such as the French Declaration of the Rights of Man and of the Citizen and the United States Constitution, which nurtured an ideology of human rights. The notion of free labor and the right to dignity as well as the obvious spurs of poverty and starvation fueled many of the labor struggles mounted against industrial leaders. When they appeared, labor unions and the

tactics of collective bargaining to improve work conditions and wages were suppressed. For example, as early as 1721 the first of the *Combinations* acts in Britain forbade journeyman and apprentice tailors from collective bargaining over hours and wages, and in 1800 another *Combinations* act made all labor unions illegal, an act that remained in effect until 1824. In the face of such suppression, labor activists nevertheless forged trade unions, and some combined to form larger federations such as the Trades Union Congress (TUC) in 1868 in Britain and the American Federation of Labor (AFL) in 1886 in the United States. Over the course of the nineteenth century, two major labor pushes were for the establishment of a ten-hour workday in the early nineteenth century and then the eight-hour workday.

The de-skilling of labor was not a peaceful process. Sabotage of industrial machinery (infamous during the Luddite riots between 1811 and 1813 in Britain) and anarchist bombings were few but much publicized. Violent strikes were also numerous. The infamous Haymarket Riot in Chicago in 1886 began when police advanced on a peaceful labor protest rally and a bomb was thrown, possibly by an agent provocateur, possibly by a radical worker; the bomb killed eight policemen. In the aftermath somewhat at random, eight anarchist leaders went on trial, none of whom could be directly connected to a specific conspiracy to commit violence, yet four were hung, and one committed suicide via dynamite in his cell. While many trade unions, such as the Knights of Labor in the United States, sought concessions from industrialists, they also promoted themselves as peaceful and patriotic. The Industrial Workers of the World (IWW, or Wobblies), founded in 1905, was avowedly more radical. Leaders such as Big Bill Haywood noted that open warfare existed between workers and company-hired enforcers, legitimating the use of force.

Amid the class warfare depicted by observers and participants such as Karl Marx, Bill Haywood, and middle-class reformer Jacob Riis, gains were made for labor, some through legislation. Throughout the nineteenth century there was concern, for example, over child labor. As early as 1802 the First Factory Act in Britain,

which provided little enforcement, touched on child labor, limiting child labor, for example, to a 12-hour day. A stronger Factory Act in 1833, in Britain, limited child labor to a 9-hour day, prohibited night work for children, and placed other regulations on industrial work. By the 1870s some of the first laws in the United States were on the books regulating workplace safety, and most forms of child labor were banned in the early twentieth century. In Japan the Factory Act of 1911 set the minimum age for workers at 12 and limited workdays to 12 hours for women and children. Living conditions for workers also were improved through the establishment of housing cooperatives and credit unions in Germany, Britain, and, later, the United States, a cause first championed in the 1840s by the Rochdale Society in England.

With universal suffrage came other slow gains for labor. The labor movement gained greater legitimacy with the forging of socialist and/or labor parties in Australia, New Zealand, Britain, Europe, and the Americas; at the same time, mainstream politicians emerged who pursued reform on the premise that ameliorative legislation was preferable to social revolution. The Bolshevik Revolution of 1917 and the founding of the Soviet Union gave physical embodiment to socialism as a form of government. As an aftermath to this revolution, in many countries there was a strong antilabor backlash.

—*Fred Nadis*

Luddites

Luddite is a term commonly used to refer to someone who opposes technical change. It derives from a period of labor upheaval in early-nineteenth-century Britain when a group following their imagined leader General Ludd or King Ludd (possibly inspired by a Ned Ludd or Ned Lud, a weaver from Anstey who smashed two knitting frames in 1779) were responsible for scattered outbreaks of machine breaking. These outbreaks took place in the period between 1811 and 1816 in some of the textile-producing areas of the Midlands and northern England.

Occasional machine breaking was not new, either in England or in other European countries, and in England had a history going back

to the seventeenth century. It has been referred to as collective bargaining by riot, as it was used mainly to pressure employers when other forms of action were unavailable or were unavailing, and it was probably not done to try to prevent industrial progress in the form of labor-saving machinery, as only certain types of machines were broken. The early-nineteenth-century period was one of general unrest. The outbreak of the French Revolution in 1789 was followed by a period of general European warfare that lasted until 1815. In the early 1800s Napoleon instituted his Continental System to disrupt British trade, which was further affected following the U.S. embargo on trade with Britain in 1812. British manufacturing consequently lost many of its important export markets, which caused significant unemployment and wage cuts by manufacturers. In addition, poor harvests resulted in rising prices for food, and food riots often accompanied or were set off by Luddite action. Because labor unions were prohibited (the Combination Acts were not repealed until 1824), there was no legal outlet for worker discontent.

The industries and occupations most affected by Luddism were not those at the leading edge of the Industrial Revolution. Rather, they were those organized on an out-work or cottage-industry basis, such as hosiery or lace making, in village locations in Lancashire, Yorkshire, Nottinghamshire, Derbyshire, and Leicestershire. Although machine breaking came to symbolize Luddite action, workers in these different areas had specific concerns that had not been resolved by other means and came to a head in the depressed circumstances of 1811–1812. What began the violence was the failure of an attempt by some Nottinghamshire hosiery firms to prevent their pieceworkers from accepting work from their competitors at lower rates, especially those using cut-up frames to produce inferior-quality stockings. When this failed, these firms cut their own rates; the workers, unable to prevent this decline in income, then started to break machines. In Yorkshire, the concern was less to prevent the fall in wage rates and more directly concerned with preventing the introduction of powered machinery—specifically the gig mill and the shear-frame—which would mechanize the process of cloth finishing and eliminate their craft.

➤ A LUDDITE WARNING

During the height of the machine breaking in 1811 and 1812, dozens of mill owners received letters threatening violence unless steps were taken to remove their recently installed machines. The letters were signed by fictional “leaders” of the Luddites, with fanciful names such as “King Ludd,” “Joe Firebrand,” or, in this case, “General Justice.” The following letter was addressed to Thomas Garside, a mill owner from the town of Stockport in northwestern England, in April 1812:

“We think it is our Boundin Duty to give you this notice that is if you doo not Cause those Dressing Machines to be Removed Within the Bounds of Seven Days from the above Date your factory and all it contains Will and Shall Surely Be Sit on fire Remember We have given you fare Warning and if your factory is Burned, it is your own falt . . . it is Not our Desire to doo you the Least Injury But We are fully Determined to Destroy Both Dressing Machines and Steam Looms. . . . We neither Regard those that keeps them Nor the Army for We Will Conquer Both or Die.”

—James H. Overfield

Source

“Letter from ‘General Justice’ to Thomas Garside, Stockport,” in *Writings of the Luddites*, edited by Kevin Binfield (Baltimore: Johns Hopkins University Press, 2004), 172.

Because outbreaks were localized, unbiased information was difficult to come by, and rumors and misinformation were rife. Many of the county magistrates who were responsible for law and order relied on informants, who were often anxious to exaggerate and thus increase their own importance. For example, building on fears of French aggression, some informants reported that French agents were providing financial support to the Luddites. It is difficult also to estimate exactly how many Luddites there actually were, but it is accepted that there was a considerable amount of popular support for them.

Luddites did not set out to cause personal injury, but in April 1812 when a factory owner

had his men open fire in defense of his establishment, two of the assailants were killed. Several deaths on both sides occurred in other outbreaks. Troops were called to restore order, but the country areas were difficult to patrol adequately. The leaders were caught and tried in 1813, however; some were hanged or transported. Apart from a brief resumption of machine breaking in 1816, Luddism ended, most likely because, by this time, the conditions that originally had led to it had improved.

Conditions of Labor in England’s Early Industrial Revolution

The conditions under which workers in England’s early Industrial Revolution labored were essentially unregulated, leading to harsh exploitation and highly unhealthy and unsafe conditions. Industrial work went on in many environments, from homeworking to artisanal shops to factories, or mills. Although the growth in factory work was the most striking feature of early industrial England to many observers, factories never employed a majority of workers. Factory workers were generally the least powerful members of the working class, required to work long hours for relatively poor wages and accept a tightly disciplined workplace. The extensive use of the labor of women and children in early factories also diminished both the pay and the status of factory labor in addition to altering the gender dynamics of many English working-class families. Traditional artisanal workers often looked down on factory workers as unskilled and

lacking the manly independence of the true Englishman. The Industrial Revolution also fostered growth in other trades, such as coal mining.

Until the passage of the first Factory Acts in the early nineteenth century, factory owners were free to set the hours and conditions of labor. The workweek lasted six days, and a workday often lasted 13 hours, with days of 14, 15, and even 16 hours not unknown. (Campaigners for laws limiting working hours and improving conditions frequently compared factory labor to the slavery practiced in the British West Indies.) During periods of heavy demand, overtime was required, and factory clocks could be manipulated by dishonest employers to squeeze out even more time. Workers arriving even a minute after the factory whistle blew to announce the start of the day were subject to harsh fines and penalties. Children who shirked their work, in the judgment of the overseer, could receive harsh physical punishment. Meal breaks were short, 15 minutes to a half an hour, and the standard practice was to offer only one break throughout the entire workday. Some factories indeed offered no meal breaks. Workers often worked from before sunup until after sundown, depriving them entirely of sunlight during the working day. (The pallor of factory workers was frequently remarked upon.) Factories and workshops were often poorly ventilated, hot, and dirty, particularly given the extensive use of coal-powered steam engines, which contributed to chronic coughing and lung disease. The poor air of factory towns was a byword. Little care was taken to maintain safety around machines or design safe machines, and accidents were common.

Factory work also challenged the work habits of many English laborers, who were used to the shifting seasonal rhythms of the agricultural year with a workday governed by the sun. Work at factories was often highly repetitive and required staying in the same position for many hours at a time. The monotony of carrying out a single task also contrasted with the variety of tasks carried out during a traditional agricultural or artisanal workday. Adjusting to work regulated by the clock and the unvarying pace of machines was particularly difficult for those whose habits had been formed in a very different labor regime.

Neither employers nor the British state took particular responsibility for unemployed workers, and the country's system of poor relief, designed for an earlier and much more agricultural British economy, was ill-suited to the demands of industry. In addition to unemployment caused by fluctuations in demand as a result of the business cycle or the failures of individual enterprises, unemployment was also caused by technological obsolescence as different handicraft trades were replaced by machines. The most notorious case is that of the handloom weavers. Handloom

➤ FRIEDRICH ENGELS ON NIGHT WORK

German businessman Friedrich Engels, best known for his intellectual partnership with Karl Marx, was a keen observer of England, where he lived for many years. Engels's *The Condition of the Working Class in England in 1844* (1845) was a passionate denunciation of the cruelty of the factory system. The following passage examines night work:

"Hence the manufacturers introduced the shameful system of night-work. Some of them employed two sets of operatives, each numerous enough to fill the whole mill, and let one set work the twelve hours of the day, and the other twelve hours of the night. It is needless to picture the effect upon the frames of young children, and even upon the health of young persons and adults, produced by permanent loss of sleep at night, which cannot be made good by any amount of sleep during the day. Irritation of the whole nervous system, with general lassitude and enfeeblement of the entire frame, were the inevitable results, with the fostering of temptation to drunkenness and unbridled sexual indulgence. One manufacturer testifies that during the two years in which night-work was carried on in his factory, the number of illegitimate children born was doubled, and such general demoralisation prevailed that he was obliged to give up night-work."

—William E. Burns

Friedrich Engels, *The Condition of the Working Class in England in 1844*, translated by Florence Kelley Wischnewetzky (New York: J. W. Lovell Company, 1892), 152.

weaving was practiced in households by outworkers who contracted individually with cloth merchants to be paid on a piecework basis. The increased supply of cotton yarn produced by mechanized spinning both attracted workers to the trade and drove up weavers' wages. However, the trade then crashed after the introduction and spread of power looms in the early nineteenth century, producing masses of underpaid, unemployed, and desperate workers. (Power looms were a principal target of the Luddite campaign of machine breaking.) Unemployed workers and their families in England's industrial cities could suffer severe malnutrition, increased vulnerability to epidemic disease, and even starvation.

Despite the harshness of working conditions, factory and other industrial work often paid more than agricultural labor. Workers were drawn from the villages and even from Ireland to fill the new industrial cities, such as Manchester, that quickly expanded with the growth of working-class neighborhoods with shoddy housing and poorly devised, unsanitary infrastructure. The new cities were warrens of disease. Many foreign visitors remarked on the contrast between the wealth and economic dynamism of Britain as a society and the misery of its workers.

British employers justified their harsh treatment of their workers on competitive grounds, claiming that an employer who shortened work hours would not be able to compete with more exploitative businesses. Despite this competitive ideology, employers frequently worked together to hold down wages and limit workers' bargaining power in response to the growing organization of workers in specific trades. They blacklisted workers whom they believed to be troublemakers. The Combination Acts of 1799 and 1800, passed through Parliament after lobbying by employers, essentially forbade workers from organizing for collective bargaining with employers. (The Combination Act also forbade collective action by employers, but despite demands by employees these provisos were never enforced.) The impact of the Combination Act varied by region and trade but was greater in large-scale industry, whether organized by factories or by outworking, than in artisanal workshops. However, the acts were not employers' only legal weapon. Most prosecutions of

workers' organizations in the ensuing years took place under other laws, such as prosecutions for conspiracy under common law. The acts were repealed in 1824 after a campaign led by London artisans rather than industrial workers. In response to a wave of strikes, a milder Combination Act was passed the following year. Regulation of the workplace through a series of Factory Acts would follow in the 1830s.

Child Labor and Child Labor Laws in Early Industrial Great Britain

Child labor during the British Industrial Revolution was not a new phenomenon. The first documentation of child labor dates back to the medieval era, when children would help their parents outside on the farm or inside with the family enterprise. The nature of child labor, however, dramatically changed during the Industrial Revolution when children began to work outside the home for strangers in factories and mines. Child labor played a key role in the manufacturing of cotton, wool, flax, silk, lace, dyeing, and coal mining and made up approximately half of the workforce in textile mills and one-quarter of the workforce in coal and metal mines. As the Industrial Revolution spread, Belgium, France, Germany, and the United States also used child labor in key industries. In all of these countries, children became independent wage earners who worked long hours in hot, stuffy factories and cold, damp coal and metal mines, with only a few short recesses.

Initially parents and society believed that the employment of children was necessary to help poor and working-class families survive. Gradually, however, many began to feel that it was essential for children to be protected from exploitation by constructing restrictive

labor legislation. The first child labor laws were passed in Great Britain in the early 1800s. The passing of such legislation was preceded by an intense debate over the nature, extent, and effects of child labor. To substantiate their claims of abusive practices, sympathizers in Parliament established commissions to collect evidence from the textile factories and mines. The first of these, called the Blue Books or Sadler Reports, interviewed children, parents, overseers, factory owners, and doctors on the conditions of employment in textile factories. The testimony revealed a considerable amount of abuse in which children were beaten, had their ears torn off, and were kicked if they talked, fell asleep, or were too slow. Critics, however, dismissed some of their conclusions, claiming that they exaggerated the extent and conditions under which children worked. Rather than representing the typical case, they argued that the factory inspectors and inspectors of the mines focused on the worst examples of abuses to make the strongest case for Parliament. They argued further that working conditions in the factories and mines were no worse than what had existed for centuries in the home and that children needed to work to prevent idleness, develop a trade for adulthood, and contribute to the family purse. A number of alternative theories have been offered to explain why child labor increased during the British Industrial Revolution. Some scholars argue that the supply of child labor increased due to poverty, population growth, custom, and the absence of schooling options. Other scholars claim that the demand for child labor increased due to low wages, technological change, and unenforceable child labor laws. It is also clear that some parents wanted their children to work because it was part of their development in becoming self-sufficient adults. Informal education (e.g., apprenticeships, learning by doing, and on-the-job training) rather than formal education was essential for children to become skilled artisans, craftsmen, or tradesmen. Society sanctioned the employment of children because there was a very strong belief that idleness bred crime and immorality.

An increasing number of scholars are convinced that demand played an important role in increasing the number of children employed.

They argue that the demand for child labor increased because children were paid lower wages than adults and had special attributes that made them more productive and easier to discipline than adults.

Great Britain's First Factory Act of 1802, which set maximum hours for children at 12 and improved working conditions in cotton mills, had little impact on the textile mills because there was no mechanism for enforcement. Similarly, the Cotton Factories Regulation Act of 1819, which set the minimum working age at nine and the maximum working hours to 12, and the 1825 bill, which attempted to prevent evasions of the 1819 act, were ineffective. Parliament passed the Regulation of Child Labor Law in 1833, which set maximum working hours at 9, prohibited night work, and allowed for inspections. This law had the potential to deter employers because inspectors were hired and fines were established for violations. Unfortunately, employers quickly realized that the chances of getting caught were negligible because there were too few inspectors for the growing number of textile mills. In addition, even if they were caught, the fines were small relative to the profits that owners made by hiring children, £1.5 per offense and £3 in the case of a second offense. Consequently, the decline in child labor was smaller than reformers had hoped.

The findings of a parliamentary commission on children and women labor employment in coal mines was so shocking that Parliament quickly passed the Mining Act of 1842, which prevented women and girls from working in mines. The next significant child labor law, the Ten Hours Bill of 1847, was passionately debated between reformers and factory owners. The bill, by limiting work hours to 10 for women and young persons, was thought to jeopardize the textile industry's competitiveness worldwide. Subsequent acts were passed that attempted to prevent evasions (1850), extend coverage to include children (1853), and cover all manufacturing (1867) by the 1847 Ten Hours Bill. The gallant efforts of the Tories, humanitarians, and evangelicals on behalf of the factory children were admirable yet often resulted in laws lacking effective implementation.

Factory Acts

The term “factory acts” refers to laws passed in Great Britain and other industrialized societies in the nineteenth and twentieth centuries to regulate working conditions in factories, especially for women and children. The general consensus among scholars is that these laws had relatively little effect on reducing child labor. In Great Britain, France, Belgium, the United States, and Germany, child labor laws were routinely ignored. Employers found loopholes in the laws, were reluctant to follow them for ideological reasons, or recognized that child labor served *de facto* as an antipoverty policy. The laws also were resisted by parents of working children.

Not surprisingly, the first factory act—the “Act for the Preservation of the Health and Morals of Apprentices and Others Employed in Cotton and Other Mills, and Cotton and Other Factories”—was passed in 1802 in Great Britain, where the Industrial Revolution began. The bill was a response to a series of epidemics that had swept through the laboring population in Manchester and especially affected large numbers of child apprentices, mainly pauper children from the rural south who were sent to the northern counties to work in factories. The act required that all mills employing 3 or more apprentices, or 20 other persons, wash the mill walls with quicklime and water; provide windows, sufficient bedding, clothes, and religious instruction for children; limit working hours to 12 per day; and prohibit all work between 9:00 p.m. and

6:00 a.m. This act applied to apprenticed workers only (not to children residing in the neighborhood) and provided for no enforcement.

During the 1800s members of Parliament continued to hotly debate the issue of female and child labor. Eventually the reformers were successful in passing 14 restrictive labor laws in addition to the Factory Act of 1802. The process was neither swift nor smooth.

Supporters of protective legislation believed that the nature of the employment in the factories and mines was severely damaging to children’s physical, psychological, and emotional development. Collectively, they worried about creating a future generation of workers who would be weak, deformed, sickly, and uneducated. Critics of restrictive legislation argued that the regulation of children’s hours would reduce exports and profits, thereby eliminating Britain’s competitive edge in world markets. Furthermore, as *laissez-faire* capitalists, they opposed the legislation on ideological grounds because they believed that the government should not intervene in family matters or in business operations.

Despite passing the first child labor law early and following up with a number of laws meant to prevent children from working long hours in dangerous conditions, Parliament was not successful in reducing child labor. None of the Factory Acts passed before 1833 included any type of enforcement mechanism. This created the illusion that the government was concerned about the use of child labor while giving factory owners free rein to conduct operations using child workers. The Cotton Factories Regulation Act of 1819 reiterated the 12-hour maximum dictated by the 1802 act and established a minimum working age of nine. Following this act the 1825 bill was passed, which attempted to prevent evasions of the 1819 act by parents and employers. Such evasions included requiring children to work 14 hours a day but breaking it up so that technically they did not violate the law. Many parents, moreover, lied either about their children’s ages or paid doctors or government officials to falsify age documents.

The first effective Factory Act was passed in 1833, the Regulation of Child Labor Law that

set maximum work hours at 9, prohibited night work, and allowed for inspections. This was the first law with any teeth, in that factories were to be subjected to regular inspections.

Mining also had come under public scrutiny when the working conditions of miners became public knowledge. The Mining Act of 1842 was passed after Parliament read the evidence presented from the Commission of the Mines, which documented that youths and women were underground in coal mines hauling coal through cold, damp tunnels. The real shock came when the commissioners produced sketches of scantily dressed boys, girls, and women in animal-like positions, with chains around their necks and waists, pulling wagons of coal. The Mining Act, as it is called, prohibited women and girls from working in the mines, although a number of females put on men's clothing to sneak down and continue working.

The next most important Factory Act was passed in 1847, the Ten Hours Bill. This bill was long debated before it was passed because factory owners argued that they would have to shut down their mills when children were absent because they played an essential role in the production process. The bill limited hours worked by young persons and women to ten hours a day in textile factories, where the exploitation was thought to be the worst. Subsequent bills in 1850, 1853, and 1867 were passed to close loopholes in the 1847 law and to extend its coverage to all manufactories.

From 1833 to 1853 there was a decline in the employment of young children, although many scholars are skeptical that the decline was caused by child labor laws.

The laws of 1833, 1847, and 1850 established improved enforcement by imposing fines on factory owners and increasing the number of factory and mine inspectors, but there were two major problems: too few inspectors and the small size of the fines. The decline in child labor may have had more to do with reduced demand for child labor due to technological change and reductions in the supply of child labor due to rising real income of the father.

Most European countries followed Britain by passing child labor laws early in the

industrialization process. Their effectiveness is also a subject of scholarly debate.

The first law in Belgium was the Royal Decree of 1842, which King Leopold I established to protect children working in manufacturing. The law was largely ignored by factory owners because no one was responsible for enforcing the law. Subsequent decrees that set minimum working ages (Royal Decree of 1884 and Royal Decree of 1889) and maximum working hours (Law of December 1889, Royal Decree of 1892, and Royal Decree of 1893) also were inconsequential because there was no enforcement mechanism. Fifty-three years later with the Royal Decree of October 1895, Belgium appointed inspectors to enforce the laws.

The first child labor law in France was passed in 1841 but was poorly enforced. Despite good intentions of moving quickly to protect children from long hours and dangerous conditions, it took 33 more years to pass a law with teeth. The law of 1874 established a minimum work age of 12 for mines and industries and a 12-hour workday. It also prohibited night work for boys younger than 16 and girls younger than 21. By this time, however, child labor had declined significantly.

Germany's factory acts were unique because of their emphasis on education. A Prussian law of 1839 established 9 as the appropriate minimum age for work and limited work hours to 10 with two 15-minute breaks and 1 hour for meals. In addition, children had to complete three years of schooling before they could work. This law was more extensive than any other country's first law, but it was just as ineffective because there was no enforcement mechanism. The Statute of 1853 established inspections and also increased the minimum working age to 12 and reduced the maximum hours of work to 6. Although an improvement on previous legislation, it was not consistently enforced. Prussia did not pass a truly effective law until the late stages of industrialization, when child labor had already begun to decline. The Statute of 1878 made factory inspections mandatory.

In the United States child labor legislation was very slow and fragmented. Initially the first laws were established on a state-by-state basis.

Eventually reformers appealed to the federal government to pass legislation that would be consistent nationwide. In 1904 the National Child Labor Committee was formed by philanthropists, clergy, reformers, and politicians committed to exposing the abuse of child workers. The committee managed to introduce the first federal child labor law in 1906, but it was soundly defeated. Subsequent laws fell victim to a similar fate. The first effective and enduring federal child labor law was the Fair Labor Standards Act of 1938. Child labor had already largely disappeared during the Great Depression, however, when thousands of workers lost their jobs.

Trade Unions

With the advent of the Industrial Revolution in the eighteenth century, the stage was set for the emergence of trade unions with the conversion of many Western European nations from agrarian-based economies emphasizing craft production to those organized around new systems of factory manufacturing, resulting in growing numbers of unskilled and semiskilled employees concentrated in one workplace. Also referred to as labor unions, trade unions can be defined as organizations of wage earners whose major objective is the maintenance or improvement of employment conditions. Although the structure and legal status of trade unions varied from country to country, these labor organizations often engaged in one or more of four popular types

of collective activities to achieve membership goals: providing members with an array of benefits; collective bargaining; organizing and engaging in industrial actions; and political activities.

With regard to member benefits, early trade unions often protected members against spells of unemployment, periods of sickness, and old age. In addition, unions engaged in collective bargaining whereby they negotiated contracts with employers covering wages, working hours, and other employment conditions. In order to pressure employers to address employee problems, whether they were connected with collective bargaining or not, trade unions organized strikes such as the 1842 General Strike in Britain over the cotton manufacturers' attempts to slash wages by 25 percent. Other forms of industrial action at the work site include work slowdowns, work-to-rule actions, and picketing. Finally, trade unions engaged in political activities including the lobbying for proworker legislation, such as the implementation in Britain of the 1871 Trade Union Act that provided unions with protection under the law and the 1874 Factory Act that limited the workday to ten hours and endorsed, worked for, and financially backed candidates and political parties that they believed were sympathetic to labor or workers as an economic class. To this end, in many countries trade unions directly affiliated themselves with political parties that they viewed as pro-working class and that often were socialist in orientation such as the Labor Party in Great Britain, which was formed in 1901, or the German Social Democratic Party, the biggest of the European workers' parties, established in 1863.

One particular type of trade union, the craft union, an organization of skilled workers found in a particular trade, had formed in the United States by the final two decades of the eighteenth century and in Britain by the first half of the nineteenth century. However, it was not until the latter half of the nineteenth century that trade union federations, groups of trade unions, emerged in Britain with the Trades Union Congress (TUC) in 1868 and in the United States with the American Federation of Labor (AFL) in 1886.

The TUC took advantage of the franchise's extension to higher-waged urban male workers in 1867 by adopting, in part, the role of a

➤ U.S. LABOR HISTORY TIMELINE—SIGNIFICANT INCIDENTS

Significant events influencing the development of the U.S. labor movement from its emergence in the late eighteenth century until the onset of World War I are contained in the timeline below.

Late 1700s—Formation of local craft unions in East Coast cities such as New York and Philadelphia.

1842—In *Commonwealth v. Hunt*, the Massachusetts Supreme Court determines that workers have the legal right to join together in order to pursue lawful goals by utilizing lawful tactics.

1869—The Knights of Labor is established.

1886—The American Federation of Labor is organized with Samuel Gompers elected president.

1892—The Homestead strike occurs when the Amalgamated Association of Iron, Steel & Tin Workers leads a work stoppage in Andrew Carnegie's steel mills.

1905—The Industrial Workers of the World is created.

1908—In *Loewe v. Lawlor*, the U.S. Supreme Court rules that the United Hatters' Union national product boycott violates the Sherman Anti-Trust Act.

1911—In New York City, 146 clothing workers die in the Triangle Shirtwaist Company fire, which draws national attention to the dangerous working conditions confronting industrial workers.

1913—The U.S. Congress establishes the U.S. Department of Labor with the head of the department, the secretary of labor, becoming a member of the cabinet.

parliamentary pressure group. In 1871 the TUC established its Parliamentary Committee, which helped to pass prolabor legislation. By 1888, 750,000 workers were trade union members in Britain. With trade unionism expanding to include new groups of workers, this industrial militancy encouraged the revitalization of socialism. By the end of World War I, a mass labor movement had emerged with a membership of 6.5 million.

In the United States, the AFL was led by Samuel Gompers, a Jewish immigrant and former Marxist, who had been active in the Cigar Makers' Union. By the time Gompers assumed the AFL presidency in 1886, he had jettisoned his Marxism for pure and simple unionism and was committed to building the craft union federation along these lines. This meant that the AFL's major goal was to improve the wages and working conditions of members in the here and now through collective bargaining as opposed to using trade unions as a vehicle for implementing socialism. Additionally, the AFL endorsed the principles of voluntarism, preferring that its members remained dependent on the trade unions for the

Members of the Industrial Workers of the World (IWW) demonstrate in New York City in April, 1914. The IWW was founded in 1905 in Chicago by anarchists, socialists and radical trade unionists. (Library of Congress)

improvement of wages and working conditions rather than obtaining such benefits through government involvement. However, fearing that industrial production could be disrupted through strikes during World War I, federal government

intervention through the War Industries Board and the War Labor Board resulted in the AFL unions receiving substantial benefits, such as the granting of the eight-hour workday and the submission of industrial disputes to arbitration.

Industrial Unions in the United States

Industrial unions seek to organize skilled, semi-skilled, and unskilled workers found in one industry or jurisdiction, or related industries or jurisdictions, as opposed to craft unions, which organize one group of skilled workers found in a particular trade such as plumbers, carpenters, electricians, etc. In the United States and throughout the world, craft unions were organized prior to industrial unions and emerged first during the eighteenth and nineteenth centuries due to the homogeneity of the skilled membership's interests with regard to wages, benefits, and working conditions. Although industrial unions are composed of a more heterogeneous group of workers than those found in craft unions, these organizations possess greater collective bargaining power vis-à-vis employers due to the vast quantity of workers represented by the union at one workplace.

With the advent of the Industrial Revolution in the United States in the 1850s combined with the refinement of mass-production technologies after the Civil War (1861–1865), large groups of semiskilled and unskilled employees were gathered together in factories in large numbers for

the first time. The low wages, minimal benefits, and poor working conditions offered by these employers created the conditions for establishing the first industrial (and national) union in the United States, the Knights of Labor (KOL). Created in 1869 as a secret society and remaining a clandestine organization until 1882, the KOL achieved a membership of 700,000 by 1886 when the media reported favorably on the KOL for challenging railroad magnate Jay Gould's wage cuts after KOL members had initiated an unsanctioned strike on Gould's railroads.

The KOL sought to alter labor-capital relations through diminishing the negative effects of depersonalized mass production and attempted to improve the morals of employees and society. In order to achieve these objectives, the KOL's program called for the education of employees and employers with respect to each party's wants and interests, the abolition of child and prison labor, equal wages for women, and public control of companies that supplied indispensable utilities (water and energy). Specific strategies that the KOL adopted for achieving this program included political action, the promotion of producer and consumer cooperatives, utilizing work stoppages as a last resort, and education of KOL members concerning the problems of industrial society. Because all workers regardless of skill level were negatively impacted by the evils of the existing industrial system, the KOL promoted a "one big union" membership approach, calling for all workers to affiliate with the labor body regardless of occupation or skill level.

Although the KOL survived until 1917, by 1890 membership had fallen to 100,000 when its strategies proved unsuccessful in realizing the organization's goals. Although the craft union-oriented American Federation of Labor (AFL) remained the dominant U.S. trade union federation in the early twentieth century, a second industrial union, the Industrial Workers of the World (IWW), also known as the Wobblies, was created in 1905 for organizing all workers, irrespective of skill, race, ethnicity, and gender. In opposition to the AFL's approach of recruiting predominantly white, skilled, native-born American workers, the Wobblies organized workers traditionally ignored by the craft union federation into one large industrial union.

PHILOSOPHIES OF THE KNIGHTS OF LABOR AND THE INDUSTRIAL WORKERS OF THE WORLD IN THEIR OWN WORDS

In the United States, the Knights of Labor was the first labor organization that was not organized according to craft or limited to skilled laborers but that represented general industrial laborers. Its membership increased until the middle of the 1880s before declining rapidly. Although the Knights' aims were somewhat conciliatory, the Industrial Workers of the World (IWW) was a much more militant organization, founded in 1905. Many of its members espoused an anarcho-syndicalist philosophy and viewed society in terms of open class warfare; the IWW was involved in many violent strikes and suffered from antilabor reprisals at the hands of veterans groups, vigilantes organized by industrial and agricultural leaders, and the government.

"[The Knights of Labor] must base its claim for labor upon higher ground than participation in the profits and emoluments, and a lessening of the hours and fatigues of labor. These are only physical effects and objects of a grosser nature, and, although imperative, are but the stepping-stone to a higher cause, of a nobler nature. The real and

ultimate reason must be based upon the more exalted and divine nature of man, his high and noble capability for good."

Source

Uriah Stephens, quoted in T. V. Powderly, *Thirty Years of Labor: 1859 to 1889* (Columbus, OH: Excelsior Publishing House, 1889), 163.

"The working class and the employing class have nothing in common. There can be no peace so long as hunger and want are found among the millions of working people and the few, who make up the employing class, have all the good things in life.

Between these two classes a struggle must go on until the workers of the world organize as a class, take possession of the earth and the machinery of production, and abolish the wage system."

Source

Preamble to the IWW Constitution (1908).

—Victor Devinatz

Tactically, the IWW encouraged the practice of revolutionary syndicalism, or the utilization of direct action tactics on the shop floor as a training ground for the conducting of a worldwide general strike in order to overthrow capitalism and to implement socialism. Successfully leading a couple of major strikes in the United States, including the 1912 Lawrence Textile Strike that included 23,000 workers, emboldened the organization. However, the IWW's opposition to U.S. involvement in World War I and its promotion of strikes in war-related industries led to the federal government's repression of the labor body during the war. Continuing government harassment after the war, for all intents and purposes, led to the IWW's downfall by 1920. Nonetheless, the IWW served as an important forerunner to the Congress of Industrial Organizations, which adopted the Wobblies' syndicalist tactics in constructing successful, stable, and viable industrial unions during the second half of the 1930s.

The Labor Movement in Australia and New Zealand

The Australian and New Zealand labor movements were characterized by a close relationship or common community of labor. Men born in one country often rose to prominence in the labor movement of the other or were labor activists in both countries. This relationship also existed in the trade union movement, especially among seamen, shearers, and miners. The bonds were strengthened by mutual isolation and exposure to the same ideologies such as utopian socialism, popularized by the novel *Looking Backward, 2000–1887*, written by the American journalist and lawyer Edward Bellamy.

The Australian Labor Party (ALP), the world's oldest labor party, was formed simultaneously in Queensland and New South Wales in 1891. The bitter defeats of the strikes among maritime, shearing, mining, and other workers, which occurred in 1890, 1891, 1892, and 1894, convinced unionists of the need to use Parliament to achieve a more equitable society. By 1899 there were ALP branches in every Australian colony. Weekly labor newspapers, the *Westralian Worker*, the *Australian Worker*, and the *Worker*, flourished in Kalgoorlie (later Perth), Sydney, and Brisbane.

There had been limited labor representation in the Australian colonial parliaments. The Melbourne Trades Hall Council, formed in the 1850s, consisted of skilled craftsmen (many of British origin)—including engineers, stonemasons, and carpenters—who protected their interests by successfully restricting entry

through the apprenticeship system, establishing appropriate wages and working conditions and creating insurance funds to assist workers in cases of unemployment, sickness, or death. Trades and Labor Councils were formed in Sydney (1871), Hobart (1883), Auckland (1876), and Wellington and in other Australian and New Zealand cities in the 1880s and 1890s. Carpenters in Wellington (1840) and Victorian stonemasons (1856) were the first workers in the world to secure an eight-hour workday. These victories were facilitated in part by the fact that skilled craftsmen were in high demand in Australia and New Zealand. In addition, the discovery of gold deposits in Victoria in the 1850s fostered a population and economic boom that enabled skilled craft unions to negotiate with employers to obtain high standards of wages and working conditions, although many less-skilled or female workers were not beneficiaries. Miners themselves gained the right to vote and enter the Legislative Assembly as a consequence of the 1854 Eureka Rebellion in which armed soldiers fired upon and killed a number of gold miners at Ballarat.

Acts legalizing trade unions were passed in South Australia (1876), New South Wales (1881), Victoria (1884, 1886), Queensland (1886), and Western Australia (1902). In the 1890s colonial governments in New South Wales, Victoria, and Queensland passed factory acts. These acts set a minimum weekly wage at two shillings and six pence, prohibited children under 13 years of age from working, granted women and children under 16 years of age a maximum workweek of 48 hours, and stipulated minimum health and sanitation requirements. Other industrial legislation included the Employers' Liability and Workers' Compensation Acts of 1897 and various mining regulation acts. Because New Zealand was settled only from the 1840s—over half a century later than Australia—and significant migration did not occur until the 1870s and 1880s, few labor laws were enacted until the 1890s. However, the exchange between the two countries that was evident in the labor movement also influenced the governments of both countries. For example, the redrafted Victorian Shops and Factories Act (1896) drew upon earlier legislation enacted in New Zealand.

As trade unions secured greater legal protections for workers in both countries, union membership increased, especially in Australia. By 1915 when Australia's total workforce numbered more than 1.4 million workers, some 528,000 workers (36 percent) were trade union members. The vast majority of these were males. In New Zealand in 1915 unionized workers made up 27 percent of the workforce.

Aside from enacting laws protecting workers, both countries adopted systems of arbitration and conciliation. The Industrial Conciliation and Arbitration Act (1894) created the New Zealand Court of Arbitration. It was comprised of a Supreme Court judge, a union representative, and an employers' representative who heard industrial disputes, made and interpreted awards, set minimum standards of employment, and set and adjusted wages. The Australian Commonwealth Arbitration Court, established in 1904, as well as state courts also held the dual roles of arbitration and conciliation; these courts settled industrial disputes and regulated wages, conditions, and margins for skilled workers. Trade unions and employer associations registered with the court, and their advocates put the case to the judge. In 1907 Justice H. B. Higgins's ruling in the *Harvester* case led to the establishment of an Australian national wage system. Higgins ruled that employers must pay their workers a basic wage, which would enable a married man with two children to live in "frugal comfort." Skilled workers were paid margins above the basic wage; margins were awarded in the Arbitration Court. The basic wage received annual increments, which were determined by the cost of living.

In 1904 the ALP, under the leadership of John Christian Watson, who was raised in New Zealand, formed the world's first national Labor government, which governed for less than four months in Australia. New Zealand took somewhat longer to establish a united labor party, with the New Zealand Labour Party (NZLP) forming in 1916. Although the maritime strike of 1890 had crossed the Tasman Sea, it did not have the same outcome. Union defeats in Australia led to the early establishment of the ALP, a party eschewing alliances with other political parties through the next century. However, in New Zealand

➤ EDWARD BELLAMY AND *LOOKING BACKWARD*

Edward Bellamy (1850–1898) was a Massachusetts lawyer and journalist whose novel *Looking Backward, 2000–1887*, inspired the formation of a number of utopian communities in the United States and was widely read in the Australian colonies.

Bellamy became aware of the suffering of the urban poor while studying in Germany. He was also influenced by the works of Laurence Gronlund, a Danish immigrant who wrote and lectured on socialism in the 1880s. *Looking Backward, 2000–1887*, was published in 1888 and sold over a million copies. The novel is about Julian West, who is transported from Boston in 1887 to Boston in the year 2000, where he encounters a utopian city. The pressing issue of West's era had been labor unrest. His host in 2000 explains that the labor problem was solved when all industries were taken over by the government. In this society there are no wars, and instead of military service, all citizens between the ages of 21 and 55 perform "industrial service," according to ability and interest. Each worker receives an equal credit to be used for purchasing goods and services.

Before writing the novel, Bellamy was not associated with any socialist groups. However, socialists were very inspired by the ideal world depicted in the novel. After its publication, Bellamy began speaking publicly about his ideas. Over 150 Nationalist Clubs, dedicated to discussing and propagating Bellamy's ideals, formed all over the United States to promote the idea that industries should be owned and operated by the government.

—Jyotsna Sreenivasan

an alliance between labor representatives in Parliament with the more social reformist-oriented New Zealand Liberal Party delayed the formation of a separate labor party.

The ALP's emergence as a separate party prior to federation and the existence of a federal system—rather than the unitary system of government adopted by New Zealand—contributed to the Australian party's success. By 1914 the ALP was established as the alternative Commonwealth government to the Liberal

Party and had already formed one or more administrations in every state except Queensland, where it was about to enter a period of 14 years in government. By 1935 when the NZLP first formed a government, the ALP had held office in five separate federal administrations, totaling nine years in Parliament.

Labor Management Clashes from 1870 to 1914

Developing capitalist economies such as those of Great Britain, Germany, France, Japan, and the United States experienced frequent clashes between labor and management at the turn of the century, caused mainly by transformations in the labor process. The term "labor process" describes the way things are made, how work is performed, and how production is organized. During this period, emerging industrial and manufacturing enterprises endeavored to maximize output by controlling every aspect of production. This required dismantling the craft basis of manufacturing and the centuries of knowledge and independence embodied in artisanal labor. While the industrializing nations developed differently, this common transition in the labor process altered economic relationships and facilitated the emergence of modern, urban, and industrial societies. However, this transformation, which involved the "de-skilling" of labor, did not go unchallenged, and organized labor emerged.

Management control over the labor process was achieved through ownership of property, manipulation of market pricing, and the systematic integration of supervision into all phases of production. When industrialists combined technological advances in machinery with what was termed "scientific management," which emphasized the ideal of efficiency, they attained the kind of productivity increases and economies of scale that made mass production of complex durable goods possible. The chief advocate of scientific management in the United States was Frederick Winslow Taylor, who developed revisions to the organization of work and introduced wage incentives to increase worker output. Drawing on Taylor's ideas, engineers at the Ford Motor Company mechanized work processes and found workers to tend their machines. With the invention of the assembly line, industrial workers were effectively reduced to mere cogs in the machine, which brought regularity to mass production.

During this time, labor itself was commodified. Businessmen, committed to the ideology of the market, believed that wages should be paid at the lowest possible price. During downturns in the economy, employers frequently cut wages and discharged workers to make room for technological advances in production. Industries were often aided by the coercive authority of governments, which protected domestic business by imposing high tariffs on foreign-manufactured goods and facilitated access to markets by developing infrastructure such as railroads. Governments were also on hand to authorize the use of state militias or federal troops to intervene in strikes as industrial violence escalated throughout this period.

Workers resisted their employers and this transformation in the labor process through a variety of means. Employees could informally slow the pace of work and thus enforce some degree of control over the job. Major clashes between labor and management often revolved around union recognition, but the pressing issues of wages, hours, and working conditions remained central to workers' demands. Once organized, workers appealed to the larger community by urging consumers to purchase goods with union labels and adhere to boycotts.

➤ THREE MAJOR STRIKES OF THE LATE NINETEENTH AND EARLY TWENTIETH CENTURIES

At the turn of the twentieth century, strikes became more frequent in many parts of the world as laborers sought to improve working conditions and obtain higher wages. Many became violent. What follows is a sampling of the era's numerous strikes.

Haymarket Riot in Chicago, 1886. On May 1, coordinated strikes and demonstrations were held in many U.S. cities to demand an eight-hour workday. Three days later several thousand workers gathered at Haymarket Square in Chicago to support striking workers at the McCormick Reaper Works. When police moved in to disperse the crowd a bomb was thrown, and in the following melee seven policemen and a number of workers were killed. The violence caused widespread shock and outrage in Chicago and nationwide. Although the bomb thrower was never identified, eight labor leaders were tried and convicted for fomenting violence. Four were hanged, one committed suicide, and three had their sentences commuted by Illinois governor John Peter Altgeld in 1893.

Australian Shearers' Strike, 1891. The Australian Shearers' Strike, one of Australia's most important

labor disputes, began in reaction to wool companies' demands that shearers accept contracts that would require them to work side-by-side with nonunion workers. Centered in Queensland, the strike involved thousands of workers who formed armed camps outside of towns. Troops were enlisted to protect strikebreakers and arrest labor union leaders. The standoff lasted from February to May, when the strike was broken and 13 union leaders were arrested; they were later tried and imprisoned. The strike contributed to the foundation of the Labor Party in 1891.

Cananea Strike, 1906. The Cananea strike took place in the Mexican border town of Cananea in June 1906, when several thousand Mexican copper miners struck over their low wages in comparison to those of American workers. The strike was eventually suppressed by Arizona posses and U.S. federal troops, who crossed the border on the invitation of Mexican authorities after the lynching of the American owners of the mine. It was a sign of the growing discontent in Mexico on the eve of the 1911 revolution that overthrew the dictator Porfirio Díaz.

—Abraham Mendoza

Although several governments placed limitations on organized labor's use of boycotting, the politics of consumption were central to industrial conflict and working-class organization. Less common but nonetheless prevalent throughout this period were the dramatic strikes as workers organized to deny their employers the use of their labor. In the United States, coal miners, garment-district workers, railway workers, and factory workers struck for better pay, shorter hours, and better working conditions. The four most dramatic strikes were the General Railroad Strike of 1877, in which railway workers across the country struck in response to a 10 percent cut in pay; the Haymarket Square demonstration in Chicago in 1886, when a rally in support of the eight-hour workday and workers locked out of the McCormick Harvester plant resulted in the deaths of eight policemen and the ensuing trial and conviction of eight anarchists, four of

whom were executed; the Carnegie Steel Strike in Homestead, Pennsylvania, in 1892 in which 6,000 troops of the state militia intervened; and the Pullman Palace Company Strike in Chicago in 1894 in which President Grover Cleveland called out federal troops to suppress the strike. In England, dockworkers struck in London in 1889 and Southampton in 1890, and matchgirls carried on a widely publicized strike in 1888. Notable strikes also occurred in Sweden, Wales, and Australia before World War I.

As workers began to organize in increasingly class-conscious ways, industrialists and social reformers alike directed their attention to the community life and work patterns of their employees. Employers recognized a need to do more than simply increase worker's productivity and began to endow reform movements that sought to dissipate class tensions through social and moral uplift. The emergence of welfare

► PULLMAN'S COMPANY TOWN

As a means of alleviating mounting class antagonisms, employers such as George Pullman sought to keep a close eye on their employees by centralizing production in model towns; he also hoped to impose morality on his employees. The Pullman Palace Car Company established Pullman, Illinois, and encouraged employees to live in company-supplied housing and to purchase goods from a company store. The town included over 1,000 homes, a grand hotel (which included the only bar), an artificial lake, a church, a theater, a school, and a library. The town was a tourist attraction, drawing reform-minded visitors daily. Inhabitants were not allowed to purchase their homes, and their lodgings were subject to company inspection tours. Rents were 20–25 percent higher than comparable lodgings in Chicago. During an economic downturn, Pullman laid off many of his workers and reduced the wages of those who remained without, however, reducing rents or utilities. Employees struck in 1894, turning to the American Railway Union and its charismatic leader Eugene V. Debs for support, and sympathy strikes soon crippled national rail service. Although the strike was lost after government intervention, this incident discredited Pullman's attempts at employer paternalism.

—Benjamin Pottruff

states did not resolve all of the tensions between labor and management but provided some protections for workers and made the tensions manageable. By the outset of World War I, mobilization of mass production for the wartime economy signaled a new era of cooperation between industries, governments, and workers who were now accustomed to the transformation of the labor process. While the market had governed relations between management and labor throughout this turbulent period, increasingly governments had a hand in addressing, not simply repressing, industrial disputes.

Cooperatives

Credit unions, workers' cooperatives, and housing cooperatives emerged as alternative forms of economic organization in nineteenth-century Western Europe and spread from there to many other parts of the world. Cooperatives were founded on the economic principle of communal property (each member was to acquire a share in his cooperative) and the political principle of one man, one vote.

In their economic organization, cooperatives were based on a true socialization of the means of production (collective ownership of stores, apartment buildings, banks, and factories as opposed to their private ownership). This economic transformation went hand in hand with political and cultural aspirations toward a society that values equality in the political and social sphere. Championed by liberal and socialist leaders, cooperatives (particularly consumer and housing cooperatives) were increasingly linked with socialist reform concepts and alternative visions for the economic, social, and cultural reorganization of industrial society. In the case of Germany, for instance, the consumer cooperative movement was part of the socialist movement and was dominated by Social Democratic officials.

The cradle of the cooperative movement was England, where in 1844 the Rochdale Society of Equitable Pioneers was founded by weavers and socialist activists. Even though it was not the first cooperative in England, the Rochdale Society became the prototype for cooperatives created in England and abroad from 1844 onward. The Rochdale cooperative was a consumer cooperative that developed the basic principles of cooperative organization (the Rochdale Principles). These principles included

open membership, democratic organization, administration of the cooperative by its members, distribution of dividends among its members, and exclusion of credit (all purchases had to be done in cash).

The Rochdale Pioneers inspired liberals and socialists alike to apply the concept of cooperation to various sectors of the economy, from the construction of healthier housing to the production of goods and farming. Victor Aimé Huber (1800–1869) was the first to suggest the formation of housing cooperatives and inspired the creation of the first German housing cooperative in Berlin in 1848. This cooperative united the concept of philanthropy with self-help. Since Huber realized that workers would not be able to accumulate all the funds needed for the construction of apartment buildings, he suggested that well-off citizens would provide these funds. Renters of these apartments, however, were expected to gain ownership of their apartments over a period of 30 years. In addition, they were to form renter cooperatives for the purpose of administering the housing cooperative (rent collection, maintenance, etc.) and for the purpose of a consumer cooperative. Huber's main goal was to transform workers without property into working property owners and thus to stabilize capitalist society. Hermann Schulze-Delitzsch (1808–1883) and Friedrich Wilhelm Raiffeisen (1818–1888) introduced credit unions in Germany during the 1850s and 1860s. While Schulze-Delitzsch saw cooperatives as a means to help and protect artisans and shopkeepers, Raiffeisen created credit cooperatives for farmers around Neuwied, a district in the Rhenish Palatinate. He applied the basic ideas of cooperation to these new credit unions, namely that those receiving financial assistance from credit unions should also be its members and oversee the operations of these cooperatives. Raiffeisen insisted that the directors were to serve in voluntary positions and that only the cashiers received a very small stipend.

As cooperatives emerged in divergent sectors, a new model of economic organization based on mutual ownership and profit sharing was being created that in the twentieth century became a significant aspect of industrial societies all over the world. From Europe, the model

➤ THE CONSUMER COOPERATIVE IN LEIPZIG-PLAGWITZ

The Consumer Cooperative was founded in Plagwitz in 1884 by Social Democrats who wanted to create a business venture that would compete with local shopkeepers who, they were convinced, exploited their position by overcharging for their goods and cheating customers with regard to weights and quality of the products sold. At the time, Plagwitz was a suburb west of Leipzig and was integrated into the city of Leipzig in 1891. It housed many factories and thus was a breeding ground for the emerging Social Democratic movement.

In return for a 50-mark membership fee, members were allowed to shop in the cooperative's stores. In addition, each member annually received a share of the cooperative's profits, determined by the amount of money spent with the cooperative. In 1899, the consumer cooperative counted 76 stores and nearly 33,000 members. The business had become a city-wide operation with its own production facilities, including a mechanized bakery, distilleries, breweries, and a coffee bean roasting house. It maintained a dairy operation, a coal retailing business, a department store, and its own credit union. After just 16 years, the consumer cooperative had become a large enterprise with over 1 million marks in sales per month. It forced shopkeepers to improve the quality of their products and lowered the living expenses for working-class families, who were the primary instigators and beneficiaries of this new organization.

—Thomas Adam

of cooperation spread, especially after World War II, to countries as far away as Israel, Tanzania, Laos, Peru, and India (to name just a few). In Africa, cooperatives were introduced in the colonial era by European settlers who were inspired by the Rochdale Pioneers and Raiffeisen.

In Australia, cooperative movements began in the 1830s with the application of some of Robert Owen's (1771–1858) ideas about villages of cooperation among emancipated convicts in the Hunter Valley. Owen envisioned the creation of agricultural communities in which the members would live in communal housing and work the land (as he tried to realize in New Harmony,

Indiana). With the arrival of free immigrants, new forms of cooperation were transplanted to Australia: consumer cooperatives, housing cooperatives, and farming cooperatives. In the United States, Oliver Hudson Kelley (1826–1913) founded the Grange Movement in 1867 to help farmers in the Upper Mississippi Valley battle railroad and grain elevator monopolies that controlled the transport and marketing of agricultural products. This movement supported the founding of local farmers' cooperatives, cooperative stores, grain elevators, banks, and farm equipment manufactories.

In the case of Japan, a newspaper article on the topic of the Rochdale Pioneers published in 1878 sparked the creation of consumer cooperatives. Only after World War I, however, did the cooperative movement in Japan thrive. The Christian reformer and labor activist Toyohiko Kagawa (1888–1960) promoted the creation of consumer co-ops as well as of agricultural and fishing cooperatives. By 1920 there were 13,442 cooperatives, with more than 2 million members.

The impact of cooperatives on society was never limited to the economic sphere. In general, the founders of cooperatives and of cooperative movements pursued the goals of social, cultural, and in some cases political change. From Robert Owen to Oliver Hudson Kelley, leaders of cooperative movements saw education as an intrinsic element for changes in society. Cooperatives represent an alternative way of economic organization and often also a counter-cultural movement.

■ Introduction: Systems of Forced Labor—Slavery and Indentured Servitude

By the nineteenth century, slavery was one of humanity's oldest institutions, existing across a variety of cultures and fulfilling many different social and economic functions. In one form or another, slavery was found in most civilizations outside Europe and Japan. In the Caribbean, Brazil, and the southern United States, agricultural slavery was the principal mode of economic production. In some of these areas, slaves composed 90 percent of the population. Slavery in these areas and the rest of the Americas was also highly racialized, with slaves identified as African and African-descended peoples, and owners, with a few scattered exceptions, as European and European-descended. The conditions of slavery varied. Generally, Catholic areas such as Brazil saw heavier involvement by the legal system in regulating relations between slave

and master and slightly ameliorating the harshness of slavery than did British colonies.

Slavery in areas such as New England and the Islamic world was less oriented to economic production and more to household service. Slaves outside the Atlantic area were also often of a different ethnicity than their masters, and the Indian Ocean trade of slaves from East Africa to the Islamic world continued in the nineteenth century. However, slavery outside the Atlantic area lacked the strong racial overtones of slavery in the Americas.

Slavery faced increasing opposition beginning in the late eighteenth century. It was criticized on humanitarian grounds, and frequently seen as in opposition to the capitalist world of free wage labor. In the decades following American independence, American slavery was

considered by many to be a declining institution that might eventually simply wither away. However, slavery in the United States received a new lease on life with the Industrial Revolution, despite the move to the abolition of the slave trade in the nineteenth century, which preceded the abolition of slavery itself by decades. The rising demand for cotton helped establish “King Cotton” as the U.S. South’s dominant crop, and the large, slave-worked cotton plantation as the basis of Southern economic, social and political power. The abolition of American slavery would eventually require a bloody civil war. Although many of the sugar islands of the Caribbean abolished slavery, from Haiti following the revolution of 1791 to Jamaica and the other British colonies in 1834, they proved unable to establish a viable sugar economy using free labor. The remaining Caribbean slave islands, such as the Spanish colony of Cuba, were actually economically strengthened as they moved into a new position as sugar producers.

The enslaved labor supply following emancipation was in large part replaced by contract workers, “indentured servants” from India and China as well as other places. Although the indentured servant had a very different legal position than the slave, the techniques used to recruit laborers were so deceitful, the work so onerous, and the indentured servant’s rights protecting against his or her employer’s abuses so few and difficult to enforce that nineteenth-century indentured servitude is sometimes referred to by scholars as “second slavery.” Chinese and Indian indentured servants were particularly important in the Pacific region and Oceania, as European colonial powers moved to exploit the area’s resources, such as guano and phosphates, on a massive scale.

By the late nineteenth century, opposition to slavery had become a mark of Euroamerican civilization, and traditional systems of slavery in Africa and other colonized areas were frequently abolished by imperial rulers. Ironically, suppressing slavery was often used as a justification for annexing territory by imperial rulers, such as Leopold of the Congo, who imposed far harsher systems of coerced labor than traditional African slavery.

—William E. Burns

Slavery in the Thirteen Colonies

Slavery arose in the American colonies to meet the demand for labor in growing cash crops for export. Slavery was racial in its confinement to blacks and hereditary in consigning the child of a slave mother to slavery. Moreover, slavery was a lifetime condition. A person born into slavery remained a slave until death unless he or she received manumission.

In 1750 the American colonies had some 2.4 million slaves, mainly concentrated in the South. Less than 3 percent of the population in New England and less than 8 percent in the Middle Colonies in 1750 were slaves. By contrast, roughly 40 percent of the population in Virginia and Maryland were slaves. The concentration of slaves was greatest in rice-growing areas, where blacks outnumbered whites 2 to 1 in the late colonial era. Dependent on the cultivation of rice, South Carolina and Georgia had populations in which more than 50 percent were slaves.

By 1780 the number of slaves in the colonies had risen to 5.7 million, with much of the increase due to reproduction rather than import. Although mortality reached 50 percent of new arrivals and men outnumbered women 2 to 1 as immigrants, many of those who survived produced children. African women had an average of 3 children; their descendents, native-born women, had an average of 6 children. Whereas

Early illustration of slaves sealing tobacco barrels on the Virginia waterfront, 1751. Scene from a map of Virginia drawn by Joshua Fry and Peter Jefferson in 1751. (Library of Congress)

in 1750 one-third of slaves in Maryland and Virginia were imports, in 1770 only one-tenth were imported. Even in South Carolina, where the import of new slaves had long outpaced the reproduction of slaves, native-born slaves outnumbered new arrivals after 1770. With the number of slaves growing apace of the demand for labor, Virginia and Maryland imported few slaves after 1770. In 1778 the Virginia House of Delegates, certain that Virginia could maintain its population of slaves by reproduction, banned their import.

A fixture in the South and present in the North, slavery nonetheless did not escape the critique of the Enlightenment, which branded it wasteful, contrary to the tenet of progress, and in violation of human rights. To this criticism the Society of Friends added that slavery contradicted the ethics of Christianity. Although Thomas Jefferson, himself a slave owner, included a sentence against slavery in a draft of

the Declaration of Independence, he removed it from the final copy at the wishes of others at the Continental Congress. Some Americans saw the contradiction between the document's idealistic rhetoric and the realities of slavery. The Revolutionary War sharpened this contradiction as the Continental Army enlisted blacks in defense of independence. For their part the British promised freedom to slaves who joined them, although this gesture stemmed from a desire to weaken the planters rather than religious or Enlightenment ideals. Some 80,000 slaves, taking advantage of the upheavals of the war, fled to freedom.

The Revolution did not abolish slavery but rather restricted it to the South. In 1777 Vermont passed a law emancipating its slaves, albeit gradually. Pennsylvania followed in 1780 and Rhode Island and Connecticut in 1784. The Northwest Ordinance in 1787 forbade slavery in the Northwest Territory. Yet the ordinance accommodated

➤ JOHN WOOLMAN, *SOME CONSIDERATIONS ON THE KEEPING OF NEGROES*, 1754

John Woolman was a Quaker merchant in New Jersey who wrote his antislavery tract *Some Considerations on the Keeping of Negroes* in 1754. This and his other writings were widely read in the northern colonies, especially within the Quaker community of New Jersey and in western Pennsylvania. An excerpt from this tract is provided below.

“All nations are of one blood. We all spend a short time on earth & we are all subject to the same illnesses, infirmities, frailties, temptations & death judgment before God. We are all brothers. . . . God’s love is universal so man must open his heart to others. If we were in their place for generations, without the benefit of civilization, wouldn’t we be

like them? Constant oppression affects their behavior. . . . Calling someone a slave & keeping him in low estate, fixes the notion that they are lower than we. Then we lose our capacity to judge & govern. When we demand hard labor from others without pay, we become severe in our judgments of them & we brutalize them for criminal behavior. One evil leads to another & true Friends [Quakers] will feel concern on this account.”

—Christopher Cumo

slave owners by letting them reclaim fugitives who had fled to the Northwest Territory. Although the United States ended the import of slaves in 1808, the Constitution counted each slave as three-fifths of a person, giving the South a larger voting bloc in the House of Representatives than would have been possible had the Constitution deemed slaves mere property. Having survived the Revolution, slavery would persist until the end of the Civil War.

Slavery in the Caribbean

Slavery in the Caribbean began with the arrival of the Spanish in 1492 and continued well into the nineteenth century. Spain’s colonization of the Caribbean islands was followed by the presence of the Dutch, British, and French. Major

commodities such as tobacco, coffee, and especially sugar fueled Caribbean slavery. During the eighteenth century the slave trade brought in more than 4 million slaves to the region, including more than 2.532 million slaves who were taken to the British islands, more than 1.180 million who were taken to the French islands, 350,000 who were taken to the Dutch islands, and more than 200,000 who were taken to Spain’s island of Cuba.

Most of these slaves were imported during the eighteenth century when the demand for sugar, one of the first luxuries consumed by the masses in Western societies in the eighteenth century, reached new heights. Sugar was one of the most labor-intensive crops. Sugarcane was harvested year-round and took up to a year and a half to mature. It also needed large amounts of fertilizer. Slaves, therefore, were forced to carry baskets of manure on their heads to fertilize the soils, a difficult and exhausting task on the steep hillsides in the Caribbean. Slaves also suffered from burns from the process of boiling juice and mutilation from the vertical rollers used to squeeze out the juice from sugarcane.

The long hours, brutal treatment, and intense heat contributed to high mortality rates. Death rates among slaves in the Caribbean were one-third higher than those of slaves in the

THE BAPTIST WAR

The Baptist War, also known as the Christmas Uprising or the Great Jamaican Slave Revolt of 1831–1832, was a slave rebellion that began as a result of the House of Commons' campaign to completely abolish the institution of slavery throughout the British Empire. Planters and slave owners who were aware of this campaign became infuriated and created a countercampaign of protest to keep slavery alive. As these debates and campaigns went on, slaves began to anticipate their freedom. In addition, economic distress as well as a six-month drought followed by heavy rains devastated the harvest and exacerbated the slaves' discontentment.

Sam Sharpe, a domestic slave and Baptist minister who worked on Montego Bay, was a literate, intelligent, and charismatic leader who attempted to spearhead a slave revolt. Motivated

by the teachings of white missionaries on abolitionism and nonviolence, Sharpe's plan was to have slaves peacefully resist work starting Christmas Day until they were freed and given wages for their work. Unfortunately, slave resistance was unsuccessful and spawned a massive riot on Christmas Day, 1831. The ten-day rebellion rallied as many as 60,000 slaves of Jamaica's 300,000 slave population. The aftermath was devastating. Six hundred twenty-six people were tried, and 312 people were executed for their involvement or supposed connection to the event. This number included Sharpe and white missionaries suspected of being allies to the enslaved. The rebellion, though unsuccessful, demonstrated the political awareness of the slaves and hastened the emancipation of slaves in the British islands in 1833.

American South, and suicide rates were also higher. The average life expectancy of a Caribbean slave was seven years after arrival. Planters believed that it was more cost-effective to simply purchase more slaves than to breed slaves, as was the practice in the United States. Their rationale was that it would take roughly

14 years before a newborn male would become a valuable worker in the field. Thus, purchasing new male slaves and working them to death was more profitable.

These conditions caused numerous rebellions, many of them sparked by newly arrived slaves from Africa who fiercely resisted their captors. Jamaica had an especially large number of slave revolts and a high incidence of sabotage, arson, and theft. In 1831 a major slave revolt in Jamaica, referred to as the Baptist War, prompted the emancipation of slaves in the British Empire. Smaller islands such as Barbados, Antigua, and Saint Kitts experienced fewer rebellions because sugar production took up so much land that rebellious slaves had few places to hide or set up maroon communities. The only successful rebellion was the Haitian Revolution (1791–1804) in which Toussaint L'Ouverture led the enslaved and free people of color to defeat the French and their allies, Spain and Britain. As a result, Haiti won its independence and became the first free black nation in the Western Hemisphere.

Insurrections were more common in the Caribbean than in the United States for many reasons. First, the ratio of slaves to white people was much greater in the Caribbean islands, where slaves often made up as much as 90

percent of a colony's population. Second, the Caribbean slave population was made up of a larger proportion of African-born slaves. Rebellions were most common when large numbers of native-born Africans were brought into an area at one time. By contrast, assimilated American slaves tended to be less likely to revolt. Third, because slavery in the Caribbean was practiced on relatively small and separated islands, it was difficult to organize military force to suppress rebellions.

The slave rebellions along with abolitionist movements in Europe contributed to the fall of slavery in the Caribbean. In 1807 Great Britain and the United States outlawed the slave trade. In 1833 Britain emancipated more than 800,000 slaves in its colonies while paying its planters 20 million pounds in compensation. In 1848 France and Denmark abolished slavery. However, the Caribbean slaves received nothing but freedom, and no attempts at reconstruction or reparations were made.

Slavery in Brazil

African slaves were first brought to the captaincies of Pernambuco and São Vicente in 1550. From these colonial centers slavery eventually spread to all areas of Brazil. It is estimated that between 3.5 million and 4 million Africans arrived in Brazil in the three centuries of slave importation, the majority coming from West and West-Central Africa. Another significant source of Brazilian slaves was Angola, while

Mozambique and other areas of East Africa provided lesser numbers of slaves.

In the sixteenth century sugar plantations, known in Brazil as *engenhos*, were established and manned by slaves. In addition, slaves were used in a variety of functions to support the plantation system, including farming, ranching, and the transport of sugar to ports for export. The use of slaves to support the sugar plantations and related enterprises grew from a few thousand in 1570 to over 30,000 by 1600. As the sugar economy flourished in the seventeenth century, an estimated 500,000 additional Africans were imported by 1640. Slaves worked both the large plantations, where hundreds labored, and the smaller holdings, *lavadores de cana*, that were worked by smaller numbers. In addition to sugar, slaves were used in the production of a variety of other export crops such as tobacco, rice, coffee, and cotton. Africans were also utilized on small farms that produced corn, fruit, manioc, chickens, hogs, and goats for sale in local town markets.

In the nineteenth century coffee production rose dramatically, and this led to a resurgence of slavery on the coffee plantations of São Paulo, Minas Gerais, and Goiás at the very time it was being abolished in other parts of Latin America. Not all slaves worked on plantations. Some found less-harsh conditions in cattle and goat raising or as teamsters. Africans also worked as deep-sea fishermen and whalers and were used in nearly all facets of maritime activity.

In Minas Gerais, Goiás, and Mato Grosso slaves worked in the gold mines or panned for gold and diamonds in the rivers. Young African women were brought in to serve as cooks and domestic servants in the camps and towns. Slave women were able to trade foodstuffs for gold, which they often used to purchase their own or their children's freedom.

Slaves performed all sorts of domestic functions in their masters' households, where women prepared food, cleaned, tended to children, mended cloths and did the laundry, while functions such as coachmen, footmen, stablemen, and sedan chair porters were performed by men. Slaves skilled in the trades including cobblers, seamstresses, and woodworkers were often hired out as *negros de ganho*, and their wages went to

➤ LUIS DA GAMA—AFRICAN BRAZILIAN ABOLITIONIST

Many elite Brazilians of African descent refrained from publicly opposing slavery or taking part in the abolitionist movement before it gained widespread acceptance in the 1870s. One notable exception was Luis Gonzaga Pinto da Gama (1830–1882). The child of an African-born mother and an aristocratic father of Portuguese descent, Gama was sold into slavery by his father to pay a gambling debt. Gama gained his freedom by obtaining documents that proved his enslavement to be illegal and eventually worked his way into a position of a clerk at a law office. There, he learned the fundamentals of law and used his knowledge to advance the cause of abolition. Gama's efforts in the courtroom gained freedom for hundreds of slaves and earned him considerable notoriety within the growing abolitionist movement. He also challenged Brazilian racial hierarchy through his literary work. In his most famous poem, "The Herd of Goats," he criticized the valorization of whiteness in Brazil by emphasizing that all Brazilians are "goats," an epithet used against African-descent multiracial Brazilians, due to centuries of racial mixture. Though active in the abolitionist cause in Brazil, Gama would not live to see the official end of slavery in 1888.

—Josef Castaneda-Liles

their owners. Young slave women were often the first sexual partner for sons of slave owners.

Slaves also played an important role in the conquest and settlement of the Brazilian littoral. Due to a shortage of Portuguese soldiers, colonists used armed slaves to defend against Indian, French, and Dutch attacks. Slave-soldiers were also used in offensive operations to pacify the coastal areas.

Slavery began to decline when Brazil abolished the slave trade in 1850. Another factor was the diversification of the economy. Manumission became common in the second half of the nineteenth century, as owners found that free labor was less costly and more efficient. Children born of slaves were granted freedom under the provisions of the Rio Branco Law of 1871. In 1885 a new law gave freedom to all slaves over the age of 60. Complete emancipation came with the

passage of the Golden Law in 1888. The Golden Law had but two articles:

Article 1: From this date, slavery is declared abolished in Brazil.

Article 2: All dispositions to the contrary are revoked.

Brazil became the last nation in the Western world to abolish slavery. The passage of the Golden Law had broad support, but it was opposed bitterly by some slave owners. Their resistance was one of several factors that led to the overthrow of the monarchy by the military in 1889 and the beginning of republican Brazil.

Slavery in the United States

Nearly as soon as the British created a permanent settlement in North America at Jamestown, slavery was introduced. Although its growth was at first minimal, slavery soon became central to American politics, economics, and social relations. Slavery was a defining factor in early American history and in the lives of African American slaves.

A Dutch sale of 20 slaves to Jamestown colonist John Rolfe in 1619 marked the first instance of slavery in British North America. For the first 50 years, Africans and white settlers worked alongside each other. But as dependence on

indentured servants lessened and as tobacco became central to the Virginian economy, African slavery became entrenched and was soon legally mandated as an inheritable lifelong condition. By the end of the seventeenth century, statutes passed by colonial legislatures decreed that children born to slave mothers would also be enslaved, and by 1750 African slaves numbered upwards of 144,000 in the Chesapeake. Two in 5 Virginians were enslaved. Another 40,000 slaves lived in Georgia and South Carolina. It is not altogether clear whether white racism toward Africans led to slavery or if enslavement fostered racist beliefs, but it is clear that racism and slavery grew together in the New World. The historian Edmund Morgan points out that in colonial Virginia, paradoxically, slavery and racism became the ideological basis for American commitment to freedom and equality for all whites.

As the United States expanded and grew, slavery evolved, becoming more important and more diverse. The importance of slavery to the American economy grew as new cash crops such as rice, indigo, and especially cotton were introduced. The historian Ira Berlin identifies four distinct slave communities that developed during the first 200 years of slavery: the North; the Chesapeake; the coastal low country of Georgia, South Carolina, and Florida; and the lower Mississippi Valley. Each possessed its own unique terrain, crops, and patterns of labor. On the eve of the American Revolution, the dependence on slavery was such that one out of five Americans was enslaved.

In the nineteenth century, slavery became largely a Southern phenomenon. While racism continued to thrive in the North, the region lacked a sustainable cash crop like tobacco that created a demand for slave labor. As a result, the institution of slavery became marginal. Between 1777 and 1804, states from Vermont to New Jersey passed laws to gradually abolish slavery. In the decades following the signing of the U.S. Constitution (which had protected slavery) the institution of slavery appeared to be waning in the South as well, but the invention of the cotton gin in 1793 brought a new cash crop to the southern and southwestern United

➤ **FREDERICK DOUGLASS, A FAMOUS AMERICAN SLAVE**

Born in 1818, Frederick Douglass became perhaps the most famous ex-slave in American history. In 1838 Douglass claimed freedom for himself by escaping to New York. In 1845 he published the first of three autobiographies, *Narrative of the Life of Frederick Douglass, An American Slave*. In it he detailed his childhood and his experiences as a slave, using his personal history to stir readers to action against slavery.

As an abolitionist speaker and writer (in addition to his books he published an antislavery newspaper, the *North Star*), Douglass worked to convince Americans that slavery was incompatible with American liberty and the ideals upon which the country was founded. Speaking in Rochester, New York, on the Fourth of July in 1852, Douglass questioned, "What to the American slave is your Fourth of July?" He then thundered, "I answer, a day that reveals to him more than all the other days of the year, the gross injustice and cruelty to which he is the constant victim." Throughout the 1850s Douglass continued to agitate against slavery, and long after the American Civil War ended he fought for African American equality and challenged Americans to fulfill the promise of the Thirteenth, Fourteenth, and Fifteenth amendments.

—Bonnie Laughlin-Schultz

States: cotton. The cultivation of cotton dramatically increased Southern reliance on slave labor and its commitment to the maintenance of the so-called peculiar institution. Fueled by cotton, southwestern territorial expansion, and the natural reproduction of a growing African American population, the number of slaves in the United States rose rapidly, from 1.5 million in 1820 to 4 million in 1860. One million slaves moved west with the expansion of cotton-growing terrain. By 1840 Southerners grew 60 percent of the world's cotton, stimulating the Northern textile industry and supplying countries as far as Russia.

On plantations (where many, but not all, slaves lived and worked), planters employed violent coercion to maintain control. Slaves learned

how to resist slavery in large and small ways, from running away to insurrection to everyday acts such as working slowly or breaking tools. Families, at times, provided a refuge and protective circle from the violence and degradation. While many slave families were split apart by sale and the lives and labor of slaves were very difficult, African Americans created a distinct culture that could be a refuge for them as they worked to create lives for themselves and their kin.

As the United States gained territory in the southwest, first with the Louisiana Purchase and later with the Mexican Cession, the question of whether slavery should be extended arose, and out of this discussion emerged competing definitions of freedom. To the abolitionist movement that arose in the 1830s and grew in the decades that followed, freedom and slavery were irreconcilable opposites; thus, antislavery activists like William Lloyd Garrison declared that slavery must be immediately abolished. Many Northerners, on the other hand, felt that freedom entailed being able to work in the new territories like Kansas and Nebraska without competing with slave labor or slave owners. In contrast, many Southerners became persuaded that freedom entailed the right to own and transport slave property within the South and beyond. Multiple conflicts over slavery's future throughout the 1840s and 1850s ultimately propelled the North and South to war. It took four years of violent war to accomplish the destruction of slavery, and in 1865 the Thirteenth Amendment abolished slavery once and for all throughout the United States.

Slavery in Pre-Colonial African Societies

Slavery in Africa has a long history, predating the European arrival by several centuries and lasting even into the twentieth century. As historian Paul E. Lovejoy has noted, scholars consider slavery a “central institution in many parts of Africa” and know that Africa was the chief supplier of slaves for “ancient civilizations, [the] Islamic world, India and [the] Americas.” A vigorous two-way slave trade between Africans and Arab peoples existed from initial contacts in the ninth century, a trade in which Africans both imported and exported human beings. Slavery was not considered a badge of inferiority, and many slaves were people of great skill and even of great learning.

Europeans arriving in West Africa discovered a well-developed, operational slave-trading system. The trans-Saharan slave trade started as part of the overall trade of salt and other minerals for food that was essential for survival in desert communities. This trade declined after Moroccans conquered the Songhai empire, but the slave trade again increased when gold trading declined.

Initially, African rulers perceived the European slave trade as simply a continuation of the trade they conducted with Arabs. Arab trade routes had connected the Sahel region, the northern Sudan, and the eastern coast into an Islamic trade network from medieval times. Africans purchased salt, horses, cloth, glassware, and metalware from Arab traders, and in return, provided gold and slaves. These two items comprised 90 percent of Africa's exports, and ivory made up most of the balance in trade goods.

Although Arabs found uses for slaves—mostly females for domestic service—the Portuguese initially had to sell slaves within Africa, mainly to Moroccans. Slowly, the Portuguese began finding use for slave labor—mostly male—on their sugar plantations on the Cape Verde Islands, Madeira, São Tomé, and Príncipe. During

the sixteenth century, they extended this trade to Portuguese possessions in the Americas.

The fact that African kingdoms participated in the slave trade is not surprising considering that slavery has had a long history in many world societies. Slavery had long been part of the normal order of things in Africa, and African rulers deemed European interest in the trade comparable to Arab interest. Only when this trade became insatiable and replaced all other legitimate commerce, even providing guns for humans, did the slave trade inflict its destructive effects on Africa, particularly West Africa.

Scholars have formulated theories about the basis for slavery in West Africa among the Ashanti, the Yoruba, and the Bini, as well as the rulers of Dahomey. One anthropologist, Melville Herskovitz, has noted that “essentially agricultural, all these societies manifest a considerable degree of specialization, from which are derived the arrangements for the exchange of goods that take the form principally of stated markets, wherein operations are carried on without the aid of a monetary system which, in pre-European days, was based on the cowry shell to facilitate the expression of values.” This highly organized economic system produced a surplus, and that surplus supported a highly differentiated class system, including the institution of slavery. In Dahomey, plantation slavery existed while in other coastal West African systems it does not appear to have done so. Slavery in other coastal West African areas was part of the highly elaborate labor specialization of the distributive system. In other kingdoms, slavery appears to have been of the domestic sort, with many slaves being reserved for the ruler’s use. Rulers could use these slaves to obtain European goods or for ritual sacrifice.

Each of the three stages of the slave trade (1350–1600, 1600–1800, and 1800–1900) was marked by slavery’s spread over ever-larger geographic areas, slavery’s increasing role in the economy of African polities, and transformation of the political and economic order. Scholars note a strong link between gold production and trade and the slave trade, especially in five areas of important production—three in West Africa and two in East Africa. There was also, of course, a regional trade in luxuries that included slave trading.

Several interesting characteristics marked African slavery. Slavery was one of many types of dependency in Africa, and it was enmeshed in the kinship system, the dominant form of social organization in most African societies. In slavery’s earliest forms, no separate slave class existed in Africa. Political influence in small-scale, kinship-based societies depended on the size of a person’s kinship group. Many, if not most, of these societies allowed slaves to become full members of the kinship group. Alternately, they might be retained as dependents whose welfare was joined with that of their owners and a relevant kinship group. Slaves formed only one type of dependency group. Early African society was not based on slavery as a central institution, but as it grew more important many African societies became slave societies.

In contrast to Islamic slavery, which expanded slowly and essentially retained many traditional African features while adding the stamp of training in a universal religion, the beginning of the transatlantic slave trade marked an explosive growth in slave trading. This expansion caused major changes in those African societies that it touched. Slavery expanded to vast areas in a short time and it did so intensely. From 650 to 1600, approximately 3.5 million to 10 million people were removed from Africa by the slave trade. This is a considerable number, but it averages to transporting 5,000–10,000 people per year over six Saharan routes and two major East African ones. These figures should be contrasted with numbers taken from 1650 to the end of the Atlantic slave trade where estimates range from just over 11 million to more than 20 million.

Clearly, there was much money to be made in the trade, and many African polities became slave societies. Little could be gained economically or militarily by opposing European traders’ desires, since their home countries often backed them. Some African rulers became so secure in their positions that they relaxed control of their court slaves. In the 1800s Sultan Bangassou, of what is now the Central African Republic, became so enriched by the slave trade and the support of Europeans involved in it that he raised the status and personal freedom of his court’s slave women.

Scholarly studies make it clear that slavery's growth could just as easily have proceeded from internal or external factors or an interaction of both. Indicative of this fact are slavery studies conducted on the Julas and other similar Islamic commercial groups. As historian John Thornton has noted, the Julas inhabited an area of the western Sudan and had "a chain of villages worked by their slaves who provided them with provisions and served as carriers on their commercial expeditions." Village heads in these settlements formed a type of minor nobility in the region. Thornton's conclusion is that "the development of commerce and of social mobility based on commerce was intimately linked to the growth of slavery, for slaves in villages performing agricultural work or carrying goods in caravans or working in mines under private supervision were essential to private commercial development."

Slaves also measured the political elite's wealth. They could be used to generate private armies, rule client areas, or produce wealth through labor or investment. For example, Sudanese empires used slave armies and administrators to check the feudal nobility's power, and studies indicate that slavery also performed the same function in other African regions. In the case of the Congo, kings collected their slaves into a central area, Mbanza Kongo, and turned them into the capital needed to consolidate power. Many of these slaves owned estates, and their combined wealth enabled rulers to resist tendencies to fragment the area into smaller and weaker political units. Similarly, the nearby Ndongo kings used slaves as administrators to combat the power of independent-minded nobles.

Not surprisingly, Europeans entering Africa in the fifteenth and sixteenth centuries found a ready source for the slave trade. A thriving market for such transactions existed, and slaveowners, merchants, and state officials were the very people Europeans made contact with. The nature of African society was such that transferring rights in people was intimately bound with the legal construction of wealth and obligation. John Thornton notes, "This legal structure made slavery and slave marketing widespread and created secondary legal mechanisms for securing and regulating the sale of slaves, which Europeans could use as well as Africans."

The conclusion appears inescapable. A well-developed system of slavery and a slave trade existed before Europeans arrived in Africa, although the rapid increase of slave exports suggests the diversion of internal routes to external ones. As John Thornton has argued, "the institution of slavery was widespread in Africa and accepted in all the exporting regions, and the capture, purchase, transport, and sale of slaves was a regular feature of African society." Seemingly, "This preexisting social arrangement was thus as much responsible as any external force for the development of the Atlantic slave trade."

Slavery in the Middle East

In the eighteenth century and much of the nineteenth century, slavery was practiced throughout the Islamic Middle East, as it had been for centuries. Islamic law required that neither Muslims nor any free non-Muslim living in the Abode of Islam (Dar al-Islam; any territory, land, or country under Islamic authority) could be enslaved. Slavery could be imposed on prisoners of war and children of slaves, and those who were enslaved were to be treated humanely. The freeing of slaves was considered a good deed and was practiced often in the wills of deceased individuals or in case of the birth of a child. In many cases, slaves lived and worshipped with their master's families but were denied the right to marry. As Muslims, slaves were considered equals to their Muslim masters but were relieved of some religious duties, such as the payment of the *zakat* (religious almsgiving tax).

The high demand for slaves was met by slaving expeditions into the Abode of War (Dar al-Harb), non-Islamic territories directly

► EUNUCHS AND HAREMS

For many years, the Western image of the Middle East was reduced to that of a palace where a polygamous Muslim ruler held sex slaves in his harem, which was guarded by a huge, castrated black man, the eunuch. The sultan of the Ottoman empire, who maintained a large harem with many wives, concubines, female relatives, and eunuchs, was seen as the epitome of this character. Of course, such arrangements were rare in Muslim society, where most families lived together and polygamy was uncommon.

But eunuchs had a special place in society. Some lived as guards and servants at sacred sites, such as the Prophet's Mosque in Medina, while others were employed by wealthy Muslims who could afford a harem. The eunuch's duty was to protect and organize his owner's private, domestic areas. The term "harem" describes something sacred or taboo. The custom to seclude female family members in private rooms appeared early in Islam, probably under Byzantine influence. The harem included up to four wives,

daughters, unmarried sisters, and the older women of the family. Access was granted only to the *mahram*, a close blood relative, normally the husband or the husband's brother, son, or father. Female servants and slaves lived and worked in the harem, while eunuchs guarded them and communicated with the outside world. This rigorous form of separation could only be maintained in the harems of wealthy merchants, ministers, or the rulers.

Turkey abolished polygamy and the harem system in 1926. However, echoes of the old harem system remain. Many private homes still maintain a section that is reserved for the family, while visitors usually remain in the guest area. Thus, the idea of gender seclusion as an important cultural feature continues and is enforced, not by eunuchs but instead by social pressure and local customs. As for eunuchs, some still exist and maintain their other essential duties as mediators and guardians of sacred places.

—Sebastian Maisel

contiguous to the Abode of Islam. This meant that most slaves came from sub-Saharan Africa, central Asia, and eastern Europe. Many larger cities had slave markets, where slave traders, often Christians and Jews, sold slaves for various purposes and to different customers. Although the idea is contested, it is believed that slaves were classified according to their race and thus had to fulfill certain duties and work.

Slaves were sold to upper- and middle-class households, where they served as domestic servants, cooks, or guards. Others were bought to entertain their masters as singers, dancers, or educators. Since sexual relations with female slaves were permitted by Islamic law, in some societies Muslim men kept slaves as concubines. If a female slave gave birth to a child, she was often freed after the death of her owner. The child was considered free.

Muslim rulers customarily maintained a secluded area for their families called the harem, or sanctuary, that was administered, occupied, and guarded by servants, eunuchs, and

concubines, all of them slaves. Furthermore, since only small-scale industry or farming was common in most of the Middle East, relatively few slaves performed hard physical labor.

Of special importance was the use of slaves in armies and as guardians for rulers. Such slaves, as they gained military prowess, often expanded their influence over their masters and at times even surpassed them and established their own dynasties, such as the Mamluks in Egypt. Until 1826 the Janissaries, former Christian slaves who were trained as warriors and administrators, were the military and governmental elite of the Ottoman empire. Slave soldiers were employed in many wars until the end of the nineteenth century.

During the nineteenth century, strong pressure was brought to bear on the Ottoman government by Western powers to abolish slavery. In response, in 1830 Sultan Mahmud II liberated all white slaves, mostly Circassians, who routinely sold their children into slavery, and some Greeks. In 1858 the trade in black slaves was

banned throughout the empire, but the order was routinely ignored, and existing black slaves were not given their freedom. Thus in 1880, under British pressure, Abdulhamid II signed a treaty that abolished slavery and the slave trade throughout the Ottoman empire. The illegal traffic in slaves continued on a limited basis, however, until after World War I.

The Decline in the West African Slave Trade

The Atlantic slave trade, which expanded and developed over nearly four centuries, did not end abruptly when Britain and the United States outlawed the participation of their citizens as of 1808. In fact, nearly 4 million captive Africans—more than 30 percent of the entire volume of the Atlantic slave trade—were forcibly transported to the Americas in the nineteenth century. Yet concerted British diplomatic and naval actions, along with a shift toward legitimate trade between Africans and Europeans, finally brought the slave trade from West Africa to an end in the 1860s.

After Great Britain's government banned its citizens' participation in the Atlantic slave trade, it attempted to force other nations to do the same. At the end of the Napoleonic Wars, British diplomats secured treaties by which France and other major continental powers agreed to abolish their slave trades. Portugal protected its extensive slave traffic between Angola and Brazil, however, by agreeing only to end slave trading north of the equator. Subsequent treaties with Spain and Brazil, which became independent from Portugal in 1822, were ineffective, and hundreds of thousands of African captives continued to flow to Brazil and Cuba for decades. This illegal trade was highly lucrative, and it

involved capital, ships, and sailors from a variety of countries including Britain, the United States, Cuba, Brazil, Spain, and Portugal.

In 1819 British lawmakers established a naval squadron to intercept slave ships that was stationed off the African coast until the end of the century. The United States and France set up small anti-slave-trade squadrons as well. Ultimately antislavery squadrons seized more than 1,500 ships carrying roughly 160,000 African prisoners. The fates of such ships and their human cargoes were determined by so-called courts of mixed commission, comprised of British and other officials and located at various sites in Africa and the Americas. Such courts released thousands of captives to face uncertain futures in Havana, Rio de Janeiro, and St. Helena (an island in the South Atlantic). But the most important site where British personnel freed ex-captives was on the African coast, at Sierra Leone.

Previously settled by black refugees from Britain and the Americas, Sierra Leone became a Crown colony as of January 1, 1808. Thereafter, the British government decided that Sierra Leone should be the relocation destination for slaves intercepted by British naval squadrons regardless of these slaves' origins and regardless of the opinions of Africans who already lived there. By 1814 there were 10,000 recaptives (that is, people rescued from slave ships) in the colony, mostly in Freetown. Over the next half century, about 3,000 new recaptives were landed at Sierra Leone per year, eventually numbering more than 150,000 and speaking over 120 separate languages. Missionaries and other reformers set up churches and schools for them, hoping to promote Christianity and Western culture in Africa. Over time, recaptives and their descendants influenced other Africans both in the vicinity of Freetown and as far away as the Bight of Benin, where thousands of Yoruba-speaking Saro (as Sierra Leonians in Nigeria were called) migrated in the middle decades of the nineteenth century.

As the European and American demand for captives slowly declined in the first half of the nineteenth century, West Africa's foreign trade in agricultural and mineral products expanded dramatically. Legitimate trade, or trade

in commodities other than slaves, responded to changing international markets and gave African elites continued access to European trade goods. The most important of the new African exports were palm products from the bights of Benin and Biafra (modern Nigeria) and groundnuts from Senegambia, both of which yielded oil used as lubricants in industrial machinery. In the 1840s, palm oil exports from the Niger River delta averaged 15,000–20,000 tons a year, equivalent to about three-quarters of total oil imports into the UK. By the mid-nineteenth century palm oil had become West Africa's major overseas export. Reformers particularly from Britain supported such legitimate trade along with missionary attempts to spread Christianity as efforts to atone for the slave trade and “redeem” Africa. Yet ironically, legitimate trade often expanded slavery within West Africa. Declining foreign demand put African slaves—still supplied through robust inland trading networks—within the purchasing power of local elites, who could put them to profitable work in commodity production.

British treaties and interceptions greatly reduced the volume of slave trafficking in the North Atlantic, especially from the West African coastal areas stretching from Senegambia to the Gold Coast. In the bights of Biafra and Benin slave exports continued, though in reduced numbers, as legitimate trade expanded. But in the South Atlantic, the slave trade was barely affected by abolition measures. West Central Africa, with its strong ties to Brazil, remained the most significant slave-exporting region in Africa, while Southeast Africa (principally Mozambique) became an important transatlantic slave exporter only in the nineteenth century. Over 2 million captives were forcibly transported from West Central Africa to Brazil in the nineteenth century, more than half of them between 1825 and 1850. The other major African slave-exporting regions—the Bight of Benin, the Bight of Biafra, and Southeast Africa—each sent nearly 400,000 captives to the Americas between 1808 and the end of Atlantic slave trading in the 1860s.

The transatlantic slave trade ceased for good after international pressure finally brought its effective prohibition in Brazil and Cuba. In 1850

➤ SAMUEL AJAYI CROWTHER

Samuel Ajayi Crowther was about 12 years old when his household was caught up in regional warfare in Yorubaland, today's southwestern Nigeria. Taken prisoner and enslaved in March 1821, he spent the next nine months bound to several different masters and walking toward the coast. At Lagos he was sold to Portuguese traders, who in April 1822 loaded him and 186 others onto a ship bound for Brazil. But to his surprise, only a day or two later two British men of war accosted the ship on which Crowther was imprisoned. The British Royal Navy seized the ship and brought it, along with its captive cargo, to Sierra Leone. There, Crowther and the others were freed by the British government. Over the succeeding years, Crowther was educated by British missionaries and became a devout Anglican. In the 1840s he worked with British missionaries to spread Christianity in the territory that became Nigeria, partly among his own Yoruba people. A gifted linguist who had studied Latin and Greek, Crowther translated the Bible into Yoruba and produced other works codifying the Yoruba, Igbo, and Nupe languages. In 1864 Crowther was ordained as the first African bishop of the Anglican Church. He died in 1891.

—Lisa Lindsay

the British Royal Navy blockaded Brazilian ports—a move that was technically illegal—although there was no public defense of slave trading either within Brazil or internationally. A Brazilian law of the same year outlawed slave importation from Africa and was effectively enforced by Brazilian and British authorities. Spanish Cuba terminated its slave trade in 1866 after a treaty and naval action involving both Britain and the United States. Though slavery itself continued to exist in Brazil and Cuba, the Atlantic slave trade finally came to an end.

Indian Indentured Servitude— India, Africa, Caribbean, Southeast Asia

Indian indentured servitude was a system of contract labor introduced during the nineteenth and early twentieth centuries by planters and overseers in various British, French, and Dutch colonies. Indian indentured laborers were contracted to work on the tea plantations of Assam in India and on the plantations and public works projects in Natal and the Transvaal in South Africa. In Southeast Asia they were recruited for plantations in Malaysia, Fiji, and Singapore. In the Caribbean the abolition of African slavery

in 1834 created the need for a regular and relatively cheap labor supply for the perpetuation of the plantation system of agriculture. Indian indentured laborers were employed mainly on the sugarcane plantations of Trinidad, British Guiana, Jamaica, Grenada, St. Lucia, St. Vincent, Martinique, Guadeloupe, and Surinam.

The contracts for indentured workers stipulated the number of years of work and the nature of the work as well as the medical care and housing facilities to be given to the laborers. In some colonies the contracts also dealt with return passages and settlement in the colony. The specific stipulations varied over time and according to estate and colony. Colonial government policies and the fluctuating demands for labor led to regular changes in the logistics of the scheme. Generally, an indentured laborer in one of the sugar colonies agreed to work for five years on the plantations. In most cases the laborers were required to work for a minimum of 45 hours a week with payment of 25 cents a day, or

➤ A WARNING TO WORKERS

The following is a copy of a pamphlet in English that was circulated in the districts of recruitment in order to prevent Indians from registering as indentured servants.

ESCAPE FROM DECEIVERS
ESCAPE FROM THE DEPÔT PEOPLE
Beware! Beware! Beware!

It is not service. It is woe.

Do not fall into their snare. They will ruin you.

You will weep your life along.

Instead of rupees, rubbish will fall (on you).

They are taking you across the Sea!

To Mauritius, to Demerara, to Fiji, to Jamaica, to
Trinidad, to Honduras.

They are not islands; they are hell.

Do not go by mistake. By exciting your greed for money they will destroy your caste. There you will have to break stones. On board ship people only get one seer of water in twenty-four hours. At stations, on pilgrimages, in Dharmasalas, in the bazaar they will ask you if you want employment. They have no employment to give. They will take you to Calcutta where by contract

They will sell you into the hands of the Sahibs.

These men are given money to deceive people.

They delude them with sweet words and
sweetmeat.

Fall not into their snare.

Do not listen to their words. These men are to be
found everywhere. Proclaim this loudly in all
villages.

and Industry*, December 1915, n.p.

they were paid per task work. In all cases they were supposed to be given allowances for clothing and food. The employers were responsible for the provision of medical care and housing facilities. In the Caribbean, the individual was given a certificate of residence after five years and was allowed to return to India upon completion of ten years' residence in the colony. In Mauritius they were required to return to India after five years.

For the colonies in Africa, Southeast Asia, and the Caribbean, the system worked as follows. The interested planters in the colony informed their relevant colonial governments of the number of laborers they required for the year. The colonial government informed the Colonial Office in London of the required number, the cost of importing this number, and the source(s) of funding. Directives were then issued to the India Office and the colonial government in the relevant presidencies in India. A government official in Calcutta would hire subagents, who hired recruiters to venture to the districts and villages to persuade laborers to register for the scheme. Once laborers were recruited, they were transported to the main depots in Calcutta and Madras and remained there until coolie ships were ready to depart. These ships were commissioned by the British imperial government to transport laborers to the colonies and were legally required to follow rigid regulations to curtail sickness and mortality during the journey.

A combination of factors led to Indians becoming contracted laborers. Internal migration within India was not unknown, and laborers were accustomed to moving from one area to another in times of severe weather or economic difficulties. With the introduction of the plantation system of agriculture by British colonizers and the large-scale cultivation of sugarcane, jute, and tea, a sizable and affordable labor supply was needed. Indentureship provided secure employment opportunities for a fixed period of time, and laborers affected by severe climatic conditions grasped these opportunities.

The emigration of Indians for overseas colonies was also a result of various factors. Internal migration, the negative impact of British colonial policies, socioeconomic conditions in India, and the development of the plantation

systems in British colonies are key factors that influenced emigration. Historians in the past have focused on two main arguments. One argument is that the socioeconomic situation in India forced the laborers to seek employment opportunities overseas, while the other is that conditions in the colonies led to the development of the system. The former emphasizes unemployment and impoverishment, droughts and famines, rapid increases in population growth, social evils such as prostitution, and restrictions on widows' remarriage in India. The latter examines the plantation system of agriculture and the extent to which it provided an opportunity for Indian laborers to obtain steady employment on the sugarcane, cocoa, and tea plantations of the Caribbean and Southeast Asia.

A more recent trend of scholarship (an Indian nationalist perspective) presents a combination of these two arguments. It attributes the large-scale emigration of Indian laborers to the coercive policies of the British imperial government in India (which led to the intensification of poverty). At the same time, British imperial policies in other colonies led to the transportation of labor from one part of the British Empire to other parts.

The Indian indentureship system faced numerous problems. Despite the British government's efforts to regulate the system, it was perceived as another form of slavery by humanitarian groups in India and Britain and throughout the colonies that recruited labor. In some colonies, the emerging Indian middle classes and cocoa and coffee planters were opposed to the labor scheme on social and economic grounds. By 1915, a massive campaign against Indian emigration and indentureship had developed in India, where individuals and organizations agitated against the system in the districts of recruitment. They conducted public meetings, distributed pamphlets, and hindered the operations of the recruiters and the depots. They called for the termination of the system on the basis that it was degrading to Indians and India. Their agitation against Indian emigration represented one small aspect of an ongoing struggle against British rule and colonialism in India whereby Indian emigration and the inferior status of Indians within the British Empire

were emphasized. They were aided by the complaints of repatriated indentured laborers, government officials, and a vocal press in India and the colonies. These combined to put pressure on the British imperial government and led to the termination of the recruitment of indentured laborers for overseas colonies on March 12, 1917. The system came to a complete end when all indentured contracts were officially terminated on January 1, 1920.

Labor Recruitment in Nineteenth-Century Oceania

As legal slavery was outlawed in most of the world during the nineteenth century, many plantation owners, mine owners, and others met their need for labor through apprenticeship programs, sharecropping, or indentured servitude (labor contracted for a limited period to pay for a debt, transportation to a certain locale, or food and lodging). The resulting labor conditions often differed little from slavery, even though the laborers were legally free. As the need for labor increased in regions bordering the Pacific, from the 1840s through the early 1900s labor recruiters came to Oceania, most notably from Peru and Australia, to seek workers. In addition, many Pacific islanders were recruited to work elsewhere in Oceania, notably Fiji, Vanuatu, and New Caledonia. Recruiters targeted people in all

parts of Oceania. The exact number of recruited laborers is disputed but was certainly in the many tens of thousands. The laborers typically worked in sugar production, in mining (nickel and guano), or as domestic servants.

Some laborers (estimates suggest just under one-third) signed honest contracts. Most of these laborers received what they had been promised, and most were able to return home once their labor obligations had been met. Just over a third of workers found, however, that they had been deliberately deceived. Mostly illiterate, these workers were unable to read their contracts and were surprised to find that their work, wages, contract length, or destination was different from what the recruiter had promised. Most of these individuals returned home but only after great hardship.

Just over one-third of the workers experienced outright kidnapping, known by the racist term “blackbirding,” and experienced working conditions similar to slavery. This occurred most frequently in the 1860s, especially with Australian and Peruvian “recruiters.” Blackbirding became more common for several reasons. In Fiji recruitment increased to provide labor for cotton plantations. Because of the American Civil War, almost all cotton exports from the United States ceased. European planters in Fiji capitalized on this opportunity, creating their own cotton industry. In order to do so labor was needed, and blackbirding began in earnest in Vanuatu and the Solomon Islands. In Queensland, a self-governing British colony in northeast Australia until 1901, laborers were recruited (by trickery or kidnapping) from Vanuatu, Papua New Guinea, the Solomon Islands, and New Caledonia to work in the sugar industry in the 1860s. It is thought that approximately 62,000 workers were brought to Queensland in the second half of the nineteenth century.

Blackbirding began to subside in the 1870s, in part because targeted peoples found ways to resist or avoid it. In some places chiefs outlawed recruitment, while in others the people hid when a ship came near. In addition, British and French authorities stepped up patrols in the Pacific to prevent illegal methods of labor recruitment. Another key step was taken when Australia passed the Pacific Island Labourers Act

THE FATE OF NIUE

The island of Niue in central Polynesia was visited by three recruiting vessels (two Peruvian and the third Spanish). The first, *Trujillo*, in 1862 took aboard 50 men. The first missionary in Niue, Reverend George Lawes, wondered whether all those placed under guard even had time to give a response before being hustled belowdecks, suggesting that they were captives more than volunteers. The second, *Rosa Patricia*, came in 1863. When a few dozen Niueans went on board hoping to trade, the captain simply sailed away. The ship then sailed to the other side of the island

and repeated the process, kidnapping 40 total. The third, *Rosa y Carmen*, arrived in 1863, already crowded with Easter, Cook, and Tokelau islanders. Under the guise of requesting dysentery medicine, the ship sailed off with the medicine and the Niueans who delivered it. The three ships took away 109 men, leaving Niue with twice as many women as men. Instances such as this were not atypical for smaller islands, especially in the mid-nineteenth century when blackbirding was at its peak.

—Joel Tishken and Allison Sellers

in 1901 as part of the White Australia Policy, requiring the deportation of approximately 7,500 Pacific islanders. The same act prohibited Pacific islanders from entering Australia after 1904.

Melanesia managed to demographically weather labor recruitment due to its larger populations. Yet for Polynesia, where populations were smaller, kidnappings were demographically devastating. Polynesians had been targeted by Peruvian recruiters for the strenuous guano industry. Kidnappers visited every inhabited island chain of Polynesia except Hawaii. Some peoples suffered a demographic disaster from which they never recovered. The population of many of the islands of Tuvalu, for example, was reduced by two-thirds.

Oceania's nineteenth-century labor experiences did increase connections between Oceania and the edges of the Pacific. Many Oceanians interacted with peoples they would not have

otherwise encountered. New pidgin languages and cultural and religious options emerged as a result. Nonetheless, some parts of Oceania entered the twentieth century depopulated and demoralized as a result of blackbirding.

Introduction: Consumerism

In the 1600s and 1700s Europeans and colonial Americans were spending ever greater amounts of money on the purchase of goods and services that clearly went beyond their basic needs for clothing, food, and shelter. Evidence for such a change in consumption patterns is provided by literary references, art and fashion

history, commentary by moralists and religious leaders, debates among philosophers about the effects of luxuries on a person's character, the emergence of coffeehouses and restaurants, the expansion of the book industry, the increase in the number of fashionable shops, and the ever-rising demand for overseas products such

as sugar and tobacco. Further evidence is provided by the recent work of historians who have examined probate inventories, the legal documents that list a deceased person's worldly goods so they can be passed on to his or her heirs. Evidence from France, the Netherlands, England, Scotland, Belgium, France, Germany, New England, or the Chesapeake region all lead to the same conclusion: from generation to generation, individuals across the social spectrum in the 1600s and 1700s were acquiring possessions in greater number, range, quality, and cost. A new age of consumerism was beginning.

Long before the seventeenth and eighteenth centuries, the world's rich, especially those who lived in cities, spent money on jewelry, expensive clothes, exotic foods, home furnishings, scents, and finely crafted weapons. In many societies, however, such spending was held back by a number of factors. The range and variety of goods available were limited, and fashions remained constant from one generation to the next, so there was no need to discard possessions and replace them with up-to-date new ones. More importantly, many religious traditions and secular philosophies discouraged self-indulgence and the amassing of possessions. Christianity, Buddhism, and Hinduism all idealized poverty. Islam taught that the performance of religious obligations, such as pilgrimage and charitable giving, was a better use of wealth than the amassing of worldly goods. Furthermore, many governments discouraged some forms of consumption through sumptuary laws, which imposed restrictions on the purchase of certain types of clothing, food, and luxury goods to maintain social distinctions and prevent wealthy individuals from impoverishing themselves and thus damaging their ability to support their families and pay taxes.

As consumerism in the United States and Europe accelerated in the nineteenth century, traditional religious arguments about its dangers continued to be made, but in an increasingly secular age, they did little to discourage people from flocking to department stores, buying goods on credit, and ordering from mail-order catalogues, all to fill their homes and wardrobes with ever greater quantities of goods. In the United States, where consumer spending lagged behind that

of England and France in the early nineteenth century but soon caught up and passed it, the production of men's and women's ready-made clothing, costume jewelry, clocks, and watches all doubled between 1890 and 1900; glassware and lamp production grew from 84,000 tons in 1890 to 250,563 tons in 1914. In 1904 approximately 374,000 pianos were sold in the United States, compared to only 32,000 in 1890.

Every explanation for the growth of consumerism in Western societies begins with the fact that beginning in the late seventeenth century prosperity was increasing on both sides of the Atlantic. Europe's and America's expanding roles in world commerce, increased agricultural production (which reduced food prices), and industrialization meant that ever-increasing numbers of people had disposable income to spend. This increase in prosperity took place at a time when a host of new products on which to spend one's money became available. In the seventeenth and eighteenth centuries, the most important consumer goods in Europe were foreign imports: tobacco, tea, coffee, chocolate, Indian cottons, and above all sugar, which by 1800 Europeans were consuming at the rate of 18 pounds (8.2 kilograms) a year. The number and variety of new products on which to spend money multiplied in the nineteenth century as a result of the Industrial Revolution. The West's mills and factories not only produced high-quality and less expensive versions of items for which there had been long-term demand (glassware, mirrors, utensils, tablecloths, draperies, carpets, clothing, musical instruments, shoes, clocks, etc.) but also a stream of brand new "must-have" products (telephones, toasters, cook stoves, electric lamps, vacuum cleaners, cameras, and equipment for newly popular sporting activities such as golf, tennis, bicycling, and baseball).

Businessmen also played an important role in encouraging consumer spending. By the end of the nineteenth century successful manufacturers and retailers had large advertising budgets, made it possible for customers to buy goods on credit, and created a new type of shopping venue, the department store. The first department store was the brainchild of Aristide Boucicaut, a Parisian fabric salesman who in the early

1850s transformed his dry goods shop *Le Bon Marché* into a store that sold mainly clothing but also furniture, kitchenware, toys, and musical instruments. His store and its many imitators occupied handsome center-city buildings with lavish window displays, had aisles and carefully arranged displays to encourage browsing, sold goods at a fixed price, and allowed exchanges and refunds. Going shopping became a popular leisure-time activity, especially for women.

Consumerism in the nineteenth century was not an exclusively Western phenomenon. The first Russian department stores were opened by French businessmen in St. Petersburg and Moscow in the 1850s. In Meiji Japan, demand for Western-style clothes, umbrellas, shoes, and musical instruments grew in the 1880s and 1890s, and Misukoshi, Tokyo's first department store (modeled by its founder Takahishi Sadao on Wanamaker's store in Philadelphia) opened in the early years of the 1900s. In the Middle East, wealthy residents of Istanbul and Cairo showed increased interest in Western clothing styles and certain Western household items such as sewing machines, but the bazaar and the small specialized shop, not the department store, remained centers of buying and selling. For many centuries, merchants on Africa's east coast had found ready buyers for imported textiles and other goods from the Middle East, and during the era of the transatlantic slave trade, Africans avidly sought European tools, weapons, alcoholic beverages, chocolate, tea, and cloths in addition to cowry shells as payment for slaves. During the colonial era British manufactures had some success marketing soaps, lotions, clothing, and household goods among their African subjects.

Nowhere outside the West, however, was there anything close to a consumer revolution. New fashions and new goods, most of them imports from Europe or the United States, attracted small numbers of wealthy individuals, but the strength of traditional value systems and the absence of major social change discouraged consumer spending. More importantly, the overwhelming majority of people in Latin America, Asia, and Africa were simply too poor to purchase anything beyond their basic needs.

—James H. Overfield

Consumerism in Africa

Since the 1700s, Eurocentric writers have considered Africa a place historically lacking in complex and dynamic economies, fashions, and populations that valued the acquisition of goods above and beyond what people need to subsist. In other words, they considered Africa—in all its vastness and diversity—a place that until very recently was devoid of consumerism. Recent scholarship has revealed not only the problematic bias in this way of thinking but also, more importantly, a rich history of consumerism on the continent that predates European imperialism in Africa.

From the tenth century onward, trade with the Middle East by way of northern and eastern Africa circulated a diversity of goods as well as Islamic religious beliefs. By the middle of the eighteenth century, the distinctiveness and attractiveness of a person's material possessions was an important way of measuring local social status. In Zanzibar by 1800 the type and variety of a person's clothing, such as the head scarf, was fundamental in establishing and negotiating political, social, religious, and gender

CONSUMERISM AND ZIMBABWE

Nineteenth-century colonial ideas of hygiene depicted African bodies in racist ways, as “barbaric,” “uncivilized,” and inferior. Africans were thought to be inherently “dirty” or unhygienic; their clothing and hairstyle fashions, not reflecting European ideas of what “respectable” men and women looked like, were seen as socially subversive. While Africans, particularly those in large cities, began to consume European items of hygiene and fashion increasingly from the 1890s onward, they did not simply emulate European consumer habits. Instead, foreign products were often incorporated into preexisting hygienic strategies. In Zimbabwe, for example, some groups adopted Vaseline, a brand of petroleum jelly, to smear on their bodies after washing instead of the more traditional mixture of soil and animal fat.

—Danielle Kinsey

differences. In this way, consumption of foreign goods became an essential part of East African culture and society.

The Atlantic slave trade focused the development of consumerism in Africa, particularly along the continent's west coast. European slave traders noticed that by the beginning of the eighteenth century consumer tastes in slaving ports had become extremely cosmopolitan, fickle, and diverse. West African traders' demands included some 40 varieties of cloth, tea, coffee, chocolate, sugar, tobacco, alcohol, precious metals, and tools. By 1800, guns and ammunition were highly valued commodities to exchange for slaves, as West African leaders came to rely more heavily on gunpowder weaponry to maintain their local authority, capture slaves, and, more and more as the nineteenth century wore on, procure ivory to exchange with Europeans. The West African royal courts often derived cultural legitimacy from possessing a variety and abundance of foreign goods, once again revealing how important consumerism was to African politics and society.

Southern Africa went through a series of precious metal and diamond rushes beginning in the 1860s that prompted Europeans to formally colonize the continent in what is referred to as the "scramble for Africa." Britain came to value southern Africa as not only a place of mineral wealth but also of potential customers for the products of British manufacture. On the diamond mining compounds in Kimberley in the 1890s, African miners were obliged to spend their wages on the compounds at mining company-owned stores. Colonialism also worked to create and attract African consumers in subtler ways: missionaries and colonial governments preached a "civilizing mission" that, among other things, encouraged Africans to adopt European ideas of hygiene, domesticity, and aesthetics by purchasing European soaps, lotions, beauty products, clothing, and other everyday household items.

Throughout the twentieth century and particularly after World War II, Western companies continued to try to open up the African market and orient consumers to their products. Advertising campaigns, product supply, and the opening of shops has happened unevenly across the

continent, creating major consumer differences between regions as well as between rural and urban areas.

Consumerism in Late Tokugawa and Meiji Japan

As a legacy of the sixteenth century, when Japan was racked by nearly constant civil war, Japan's warrior aristocracy favored policies of self-sufficiency that were necessary in times of warfare. Commerce was limited, and merchants were consigned to the bottom tier of the class system. With peace and improvements in transportation, commerce began to flourish in the seventeenth century. This, coupled with financial requirements of the alternate attendance system, by which daimyo (feudal barons) alternated between living in their home domain and in Edo (present-day Tokyo) on an annual basis, inspired daimyo to concentrate on growing cash crops such as sugar and indigo rather than striving for self-sufficiency within each domain. The alternate attendance system also led to improvements in transportation and the development of nationwide trade, and the city of Osaka became the principal market for goods. By the Genroku period (1688–1704), the merchant houses of Osaka had become wealthy, and consumption extended beyond the samurai class. Increasingly well-to-do peasants, artisans, and merchants became involved in conspicuous consumption that led to inflation and the government's eventual revaluation of the coinage.

▶ WOODBLOCK PRINTS AND CONSUMERISM

One of the main aspects of Japanese consumerism is found in the print culture that dates back to the 1600s and gained world attention during the Meiji period. Most widely known are the woodblock prints that were used to publicize famous courtesans and actors and the pleasures of life in cities. Beginning in the late eighteenth century, artists such as Hokusai (1760–1849) and Hiroshige (1797) made popular the depiction of landscapes, produced for the consumption of commoners rather than elites, and in the Tempo Reforms of 1842 the depiction of courtesans and actors was banned altogether as a means of improving public morality. After the increase of trade with Europe during the Meiji Era, interest in photography and new printing techniques undercut the market for traditional Japanese woodcuts. While the Japanese were often wrapping porcelain for export with old woodblock prints, famous European artists such as van Gogh and Monet were influenced by the prints and popularized the genre in Europe.

—David Rands

A woodblock print by Utagawa Hiroshige depicts a drinking party at the teahouse Kawachiro, with women dancing and playing musical instruments for two men. Hiroshige's prints were in high demand in nineteenth-century Japan. (Library of Congress)

In the eighteenth century, however, because the daimyo were limited to taxing agriculture and not commerce, they found themselves under ever increasing economic burdens. With a fixed tax base and rising inflation, they were forced to borrow money from financially successful merchants, and by the end of the Tokugawa period, the government was advocating austere spending practices for the daimyo it oversaw. Consumerism was not absent at the end of the Tokugawa period, however, and merchants continued to engage in conspicuous consumption as they found their purchasing power far above their social status. While not specifically regulated to the level of written sumptuary laws on a national scale, the four-class social order prohibited merchants, the bottom social class, from the luxuries of those above them. Thus, a merchant might have worn a cotton kimono as an outer garment while wearing silk clothing underneath. Conversely, a member of the samurai class would be consigned to wear a silken kimono as an outer garment while wearing cotton underclothing. Economic realities were not reflected in the social hierarchy.

The Meiji Restoration led to changes in the nature of Japanese society that greatly affected consumerism. The class hierarchy of the Tokugawa period was dismantled, and samurai, who had been prohibited from engaging in commerce, became active participants in Japan's industrialization. As the isolationist policies of the Tokugawa were replaced by more liberal trading practices, men from all former social classes began to engage in trade with the West. The increase in social mobility, industrialization, and new freedoms for financial pursuits among samurai fueled Japanese consumerism.

Among the many factors giving rise to an increase in consumerism, none was more important than the government's policy of adopting Western practices. Known as *bunmei kaika*, this represented a dramatic change in thinking. The government no longer advocated austerity but rather advocated the adoption and mastery of capitalistic business practices. In Japan the samurai took the lead in the liberalization and modernization of the Japanese economy by adopting Western ideals. Japanese fashion was

replaced by Western attire, and wealth was displayed through the accumulation of consumer goods as symbols of social status. Significant to this was the development of the Japanese department store, the first of which began in 1908 with the Daimaru Department Store in Kyoto. Multistoried and carrying a wide variety of consumer goods, these stores represent the apex of consumerism that grew from the end of the Tokugawa through the Meiji periods.

From the Genroku period, consumerism became an important part of Japanese society. At times relegated to specific social classes, it nevertheless continued to have a place in the Japanese economy. When Tokugawa political control collapsed, the social order ceased to be a constraint on consumerism, and people from all social classes saw economic success as a means of gaining prestige. This increase in social mobility, based on conspicuous consumption, allowed consumerism an even greater role in the Japanese economy through the end of the Meiji period.

Consumerism in North America and Europe

Consumerism, or the acquisition of material goods beyond subsistence for the purpose of satisfying desires, forming identities, and displaying social position, developed in two stages. In the first stage, industrialization and the expansion of the commercial economy in the eighteenth and early nineteenth centuries heralded a consumer revolution in which more people than ever before could enjoy the possibilities of buying consumer goods. This remained restricted primarily to the wealthy and the new middle class, leaving

peasants and the working class either producing for themselves or concerned instead with basic subsistence and survival. In the second stage, mass consumerism, which only emerged in the later nineteenth century, took hold as new approaches to marketing and a wider variety of inexpensive products transformed life for all social classes. No longer focused on bare subsistence, almost everyone could participate in the consumer economy.

The process of industrialization, which emerged first in Britain in the latter half of the eighteenth century, introduced new production techniques and technologies that brought less expensive and more plentiful goods to the marketplace. Most famously, cotton textiles were among the first mass-produced, machine-produced commodities. Produced in large mills, particularly in the north of England, cotton fabric was both durable and took dye well. In addition to wealthier markets, fabric was also sold abroad to the poor and even to the factory workers who produced it. In the last years of the eighteenth century the production and sale of cotton fabric brought vast profits to England's middle-class entrepreneurs and factory owners, encouraging class competition and social emulation whereby individuals sought to identify and maintain their class position through the purchase and display of consumer goods. This sustained a middle-class economy of "things," identified by the eager purchase of material goods, including luxury items such as Wedgwood china and glassware; household items including pewter, cutlery, and tea equipment; and personal products such as watches, shaving goods, and perfumes. These material goods took on ever-increasing prominence, as the list of items now deemed "necessities" continued to grow and take on ever more powerful emotional significance.

The growth of eighteenth-century consumerism is also characterized by the expansion of shops and the development of early marketing techniques. Producers and shopkeepers realized that the purchase of goods was not limited just to goods needed for subsistence and basic well-being; rather, wants and needs could be expanded almost indefinitely to meet expectations of class position and comfort. The number of retail shops grew throughout Europe, and early advertising

in the form of posters, trade cards, and window displays emerged at this time as well. Shoppers were further encouraged to consume by the extension of credit, the promotion of bargain items, and even the sale of some goods at a loss.

This first stage of consumerism was not a pronounced feature of early North America outside of Southern landowners and the urban middle-class of the northeastern United States. While some wealthier Americans sought to emulate European fashions and trends through the purchase of clothes, furniture, and ceramics, others, particularly at times of tension with Britain, avoided consuming “British baubles.” In the eighteenth century, moreover, many Americans still relied upon barter rather than a cash economy, and the limited number of shops, the largely rural population, and nationalist feelings that often disparaged European influences all limited the growth of a consumer economy.

The second stage of consumerism took off on both sides of the Atlantic from about 1850. This stage is characterized by increasing numbers of retail shops (and later the development of the department store), a focus on visual display rather than textual advertisements, and a new emphasis on large consumer durables, notably household appliances and the automobile in the early twentieth century. By the time of the American Civil War (1861–1865), mass consumerism was developing in the United States as increased urbanization, immigration, and wealth contributed to larger markets that could sustain significant economic growth. Increased competition and a series of economic depressions in the last quarter of the nineteenth century later encouraged producers to place emphasis on managing sales and demand rather than on production.

Larger markets and greater competition also promoted the transformation of small shops, the mainstay of traditional consumption, to grand department stores. Whiteleys (London), the Bon Marché (Paris), Marshall Field’s (Chicago), Wanamaker’s (Philadelphia), and others expanded or opened across Europe and the United States in the second half of the nineteenth century. These consumer emporiums coordinated the sale of diverse goods and sold the experience of shopping as an activity worthy in its own right. The department store came to be a place not just

➤ JOSIAH WEDGWOOD

One of the first entrepreneurs to recognize and harness the power of consumerism was Josiah Wedgwood (1730–1795). Responding to a demand for expensive Chinese porcelain, which far exceeded the supply available in Britain, Wedgwood introduced production and marketing techniques to promote his products. His division of labor process efficiently produced large numbers of ceramics whereby workers and artists were responsible for only small parts of the final product. Wedgwood also recognized that business and amusement were intertwined in the consumer economy, so he introduced elaborate London showrooms to display his wares and attract the attention of wealthy middle-class patrons. Finally, he actively sought out aristocratic patronage, carefully publicizing royal use of his products such as his Queen’s Ware line used by Queen Charlotte. These early endorsements were designed to appeal to a consuming public eager to replicate the tastes and styles of their social superiors.

—Justin Bengry

to see the phenomenal range of material goods available to consumers but also to be seen participating in the consumer economy.

For many women, the space opened up by these new urban shopping venues offered new experiences of the modern metropolis and sites where they could enjoy the pleasures of modern life away from what was often seen as the stifling confines of the middle-class home. Women had long organized family purchasing decisions and the household economy, yet by the late nineteenth century the female shopper was increasingly characterized as irrational and gullible. Even the term “kleptomania” was coined to describe women so consumed with desire for commodities and social emulation that they stole items they did not actually need.

By the early twentieth century, mass consumerism was a widely accepted feature of life across Europe and North America. Consumer debt increased relative to savings compared to the previous century. Marketing and advertising were becoming professional areas of expertise, seeking to segment and analyze markets based

on gender, age, class, and ethnicity to better understand desires and buying habits. Producers and retailers of material goods were relying upon this expertise to understand their markets and modify products. But they also began to modify products in the interest of planned obsolescence to encourage consumption of newer products to replace those that no longer satisfied consumer desires. Most importantly, an overall increase in wealth and the ability of working-class consumers to purchase more material goods than ever before made mass consumerism virtually universal in the twentieth century.

Development of the Department Store

The department stores that emerged in Europe and the United States in the mid- to late nineteenth century aided the shift in industrialized

nations from economies of production to economies of consumption. This economic transformation inspired a shift in values as the buying public was encouraged to reject older notions of thrift and industriousness and instead to develop a taste for leisure and luxury. One historian, William Leach, has argued that the department store was an incubator of an emerging consumerist “land of desire.”

The forerunners of the large department stores of the turn of the century were large wholesale establishments that included a well-stocked shop floor where retail customers could roam among product displays rather than having to stand at a counter and place orders. Most notable were A. T. Stewart’s Marble Palace (1846) and Stewart’s larger Iron Palace (1862) in New York City as well as Aristide Boucicaut’s Bon Marché, which opened in Paris in 1869. Such establishments revolutionized the retail process and transformed shopping into a leisure activity. By the early twentieth century most large Western cities featured large, elaborate department stores, as did major cities in Japan.

The large department stores that appeared in this era, including Macy’s in New York, Marshall Field’s in Chicago, Wanamaker’s in Philadelphia, and Harrods of London were architectural extravaganzas filled with opulent spectacles, overloading the senses and encouraging in the common citizen a taste for luxury. For its 1902 opening in Chicago, for example, Marshall Field’s, had six orchestras playing and 39 marble-floored lavatories available. The new stores were meant to appeal, in particular, to middle-class women who were active agents in the creation of consumer culture. These stores offered women an entry to the public sphere where they could treat shopping as a new pastime. The department stores were social centers that featured concerts, facilities for child care, restaurants, art exhibits, fashion shows, lavish window displays, theaters, quiet rooms, luxurious washrooms, and pageantry.

The stimulation of consumerist desire was carefully choreographed. Innovations such as revolving doors, sidewalk entrances without stoops, and escalators made it easy for customers to enter and circulate throughout the building. Buying also was made easy. Credit was

Pedestrians look at Marshall Field's window, Chicago, 1909. (Bettmann/Corbis)

➤ A NEW KIND OF STORE

John Wanamaker opened his New Kind of Store in Philadelphia in 1877, one year after Philadelphia's Centennial Exposition of 1876, the first world's fair held in the United States. The fair had inspired him, as an early biographer said, to create a "store that would in itself be a great exposition." Joseph Appel's *The Business Biography of John Wanamaker Founder and Builder, America's Merchant Pioneer from 1861 to 1922* (1930), listed the following Wanamaker firsts:

- 1876—First restaurant in a general store.
- 1878—Grand Illumination of Store (no goods sold) from 7:30 to 10:00 in the evening; "Simply an opportunity to promenade and see the sights of the store." (November 11)
- 1880—Bargain Room opened.
- 1882—First soda fountain installed.
- 1883—Dairy restaurant opens, with pastry and ice cream made on the premises.
- 1883—Rolling chairs provided for those visitors who could not walk around.

- 1884—Bureau of Information and Post Office opened in Arcade, "where 50,000 people pass to and fro in a day."
- 1886—First exhibition of fashion after manner of Paris stores.
- 1887—Celebration of the Centennial of the adoption of the Constitution of the United States. "Women are dressed in Revolutionary costumes spinning flax, and there are old time shoemakers and other industrial exhibits."
- 1890—"Never outside of Paris has so great a quantity of muslin underwear been sold in so brief a time."
- 1892—Paris Salon paintings first brought to America for exhibition in the store.
- 1893—A miniature world's fair in the store, with its exhibits later shown at the Chicago Exposition.
- 1896—Main aisle arrayed as a reproduction of the Rue de la Paix in Paris.

—Fred Nadis

offered as well as installment payment plans, charge accounts, money-back guarantees, and free delivery. Department stores also flooded turn-of-the-century newspapers with advertisements to encourage business. Owners sought to promote their stores as cultural centers. For example, John Wanamaker, a devout Christian, channeled the Christian notion of service to the consumer experience; his employees were to treat all customers with deference, while the store itself was positioned as serving the wider community. In this sense the department store helped forge a new mass culture in which class distinctions began to blur, while links to older ethical principles remained.

By the late nineteenth century large retailers had emerged not only in the United States and Europe but also in Japan. Takashimaya, which began as a kimono retail store in Kyoto in the nineteenth century, by 1901 had branch stores in Tokyo, Yokohama, Osaka, and Kobe. With the popularity of Japanese art and handicrafts of the late nineteenth century in full force in Europe,

Takashimaya opened a branch store in Lyons, France, in 1899 and exhibited at the Paris Exposition of 1900.

By the early twentieth century the department store had emerged as an important new economic and cultural institution. Consumption became not only an acceptable leisure activity but also a form of duty, as consumers reciprocated the idea of service that emanated from department stores such as Wanamaker's.

Mail Order Merchandising— The Sears Catalog

Along with giant department stores that catered to urban crowds, the mail order catalogs that sold to rural areas of the United States were important adjuncts to the rise of consumerism at the turn of the twentieth century. Federally mandated delivery services such as Rural Free Delivery and Parcel Post helped to nurture mail order businesses.

The modern mail order business began in 1872 when A. Montgomery Ward started his catalog, offering “all kinds of merchandise” to rural customers. He called his business “the Original Grange Supply House” and gained endorsements from officials of the Grange Halls that then served as mutual support societies for farmers. By 1886, the Ward’s catalog had as many as 280

pages listing up to 10,000 items. That same year, Richard Warren Sears began his own company. Sears had been a railroad station agent who had experimented with selling goods, particularly watches, via other station agents in rural Minnesota while relying on cut-rate railway shipping fares. In 1886 he opened the R. W. Sears Watch Company in Minneapolis and in 1887 moved the booming business to Chicago, closer to the nation’s manufacturing and railroad centers. He re-incorporated the business under the name Sears, Roebuck and Co. in 1893.

Sears was a skilled promoter with a gift for crafting advertisements that appealed to rural residents. While his first advertisements were simple fliers offering watches, jewelry, and silverware, by 1893 the Sears catalog included items such as firearms, sewing machines, bicycles, cream separators, women’s clothing, books, and seeds. Despite the company’s growth, Sears’s irresponsible business practices made his original partner, the watch repairman Alvah Roebuck, nervous. In 1896, after Roebuck left the firm, Chicago garment manufacturer Julius Rosenwald, a gifted businessman, joined the company. Under Rosenwald’s guidance, the company’s strategy changed. Rather than simply selling whatever was on hand as in the past, they attempted to become a dependable supply house for American farmers, offering any goods that rural Americans needed. They offered reasonable prices and “money back guarantees” while gaining profits through high-volume sales. Sales increased from \$750,000 in 1895, the year before Rosenwald joined, to \$10 million in 1900, the year that Sears became more profitable than Montgomery Ward’s. By 1907, Sears’s sales reached \$50 million.

In keeping with the turn of the century vogue for “scientific management,” Rosenwald encouraged high-efficiency operations. In 1906, under Rosenwald’s direction, Sears built an enormous new headquarters and warehouse, covering 40 acres (16 hectares) of Chicago’s west side, with easy access to railroads and equipped within and without with modernized warehouse equipment. In 1909 Sears, already a wealthy man, stepped down as an active partner and eventually sold his share of the company to speculators. Business—and the catalog—continued to expand. In 1908 over 3 million copies of the

In 1906, Sears expanded its catalog and warehouse operations from its Chicago base to Dallas and began to issue a separate catalog for Texans. This 1923 catalog cover offered an idealized vision of domesticity. (Sears, Roebuck and Co., Dallas, Texas, 1923)

Sears catalog were distributed, and the catalog company's merchandise included not only all the items needed to furnish a house or farm but also mail order houses as well. Over the next three decades, Sears shipped as many as 100,000 mail order houses to customers, who, with a few simple tools and construction know-how, could follow the plans to build homes in numerous styles and at a range of costs below market prices.

Sears, with its high-volume sales and its high-profile catalog—standard equipment in most farm homes—became a cultural icon at the turn of the century. While farm children might fondly remember the Sears catalog as their first reader, silent film comedian Buster Keaton's *One Week* (1920) featured Keaton and his bride disastrously attempting to build a mail order house. Sears, a big business based on mass manufacture, relied on its "folksy" image for its mass marketing. At the turn of the twentieth century, mail order businesses such as Sears and Montgomery Ward offered an enticing consumer lifestyle and big-city tastes to rural homes.

The Advertising Industry

The modern advertising industry, with its focus on visual advertisements designed by specialized professionals, emerged only in the late nineteenth century. Earlier advertising was instead produced and distributed by individual manufacturers and business owners. Only in the last century have advertising professionals and firms emerged to become part of an organized industry. This is the result of competition among manufacturers, retailers, and advertising agents as well as the mid-nineteenth-century expansion of the press.

The emergence of advertising as a serious business strategy is linked to late-eighteenth-century industrialization in Britain and the consumer revolution it spawned. New technologies and investments in machinery increased

production, making high volumes of inexpensive consumer goods available for the first time. Improved transportation infrastructure, including railway transport from the mid-nineteenth century, also meant that goods could be distributed more widely and also encouraged competition on a larger regional and national scale.

Because the American economy remained largely rural and agrarian until after the American Civil War, industrialization would not fully develop until the last half of the nineteenth century. The comparatively later expansion of the U.S. railway and transportation infrastructure in the last quarter of the nineteenth century further slowed the development of a consumer economy. As in Europe earlier in the century, however, markets, distribution, and competition all eventually expanded and encouraged the growth of national advertising, brand names, and product differentiation.

➤ IMPERIALISM AND ADVERTISING

At the height of British imperialism before the First World War, even the most familiar domestic commodities, such as soap, were used to promote the colonial project. Soap advertisements in particular cast colonial peoples as savage and backward. Many showed Africans' skin—particularly that of children—washed white and pure by the civilizing influence of their product.

—Justin Bengry

(Mary Evans Picture Library/The Image Works)

Eighteenth- and early-nineteenth-century businesses relied on a variety of methods that offered limited local advertising. These included bill posting, trade cards, and even apprentices yelling into the street before widespread newspaper and magazine advertisements were possible. Print advertisements appearing at this time in local newspapers remained small and were grouped together with similar products. Imagery was usually restricted to a simple woodcut identifying a group of ads rather than any specific product.

As distribution widened and competition increased, producers needed knowledgeable experts to help promote products. Newspapers also needed to be sure that potential advertisers would pay for advertising space. Early-nineteenth-century advertising agents filled these roles and were generally paid commissions by newspapers for the advertisements they supplied. Other agents would buy advertising space and then sell it to businesses at a profit. Some of these advertising agents began to write ad copy, and by midcentury some even published their own lists of newspapers, circulation, and publication information, thereby beginning the process of centralizing advertising and publicity activities within a professional group.

The newspaper and magazine industry also played a key role in the development of modern advertising on both sides of the Atlantic. In England, taxes on both paper and advertisements had slowed the expansion of the newspaper and advertising industries. Their abolition in the 1850s promoted the rapid expansion of the press. In the United States, preferential postal rates for magazines helped to expand the national press. Widely distributed consumer magazines directed to women, such as *Harp-er's Bazaar* and the *Ladies' Home Journal*, as well as cheap penny publications, including the *Penny Illustrated Paper*, emerged at this time, allowing ads to be seen by millions of potential consumers.

In Britain, London agents provided access to the major national daily newspapers and mass-circulation magazines that were based in the capital. In the United States, a similar concentration of agents clustered around Park Row in New York. As the use of advertising expanded in the

twentieth century, these agents, no longer mere brokers of advertising space, expanded their activities both to compete with other agents and to answer the demands of advertisers. Many grew to become full-service agents offering outdoor and media advertising, ad layout and design, placement, and copy services. Competing with one another and increasingly identifying themselves as a professional body, twentieth-century advertising agents were part of a new industry closely related to the powerful forces of consumerism, marketing, and mass media.

Kleptomania

Why were comfortable middle- and upper-class women stealing with a seemingly wanton impulsiveness from the display tables of the new department stores in Paris, London, and New York in the late nineteenth century? This riddle came to preoccupy medical and judicial authorities, writers, and even the public at large. Kleptomania emerged as a widely accepted diagnosis and explanation for this new wave of shoplifting, one that located the cause of these incongruous acts in the presumed frailty of woman's nature. The poor might steal out of need, the thinking ran, but these women were stealing because they could not control themselves.

The setting for the kleptomaniac's crimes—real and imagined—was the modern department store, an innovation of the mid-1800s. In addition to representing a new business model based on economies of scale, the department store offered its shoppers a more enticing environment of display and consumption. With its window displays luring passersby inside, its free entry

to encourage noncommittal browsing, and its calculated deployment of natural and artificial light and staging of goods, the department store enabled a far freer and more active interaction with available goods than had previous retailing. Department store entrepreneurs aimed in particular at providing a “Ladies’ Paradise,” to borrow the title of the French writer Emile Zola’s famous 1883 department store novel, an environment where women’s needs and desires could be fully and even criminally indulged.

For Zola as for others who wrote about kleptomania in these years, it was indeed female desire that seemed to be the root of the problem. The growing authority of scientific medicine was quickly brought to bear on the question, with doctors in Europe and America commonly seeking out the explanation for such motiveless theft in woman’s unique physiological constitution. Mixing scientific and quasi-scientific findings with Victorian conventions about natural gender difference, medical opinion in Europe and America cast women’s thefts as a temporary impairment of the will, brought on by the desire-stimulating environment of the department store. Presumed to be inherently vulnerable and unstable in the face of such desire, middle- and upper-class women were made in the kleptomania diagnosis (and legal defense) to seem more sick than criminal.

With more than 4,000 arrests for shoplifting in Paris in 1883 alone and a spate of very public trials there as well as in London, New York, and other cities, the kleptomaniac remained an object of study and public fascination through the turn of the century. In historical perspective, the kleptomania controversy is important in revealing the tensions and anxieties that accompanied the rise of consumer society and the shift from a bourgeois ethic of thrift to one grounded in pleasure and consumption. As women’s roles evolved to include a greater public presence in

➤ FROM EMILE ZOLA, *THE LADIES’ PARADISE*

“Madame de Boves did not reply. Then her daughter, looking round with her podgy face, saw her mother with her hands deep in the lace and in the act of making some flounces of Alençon disappear up the sleeve of her coat. Blanche did not seem surprised, and moved forward instinctively to hide her when Jouve (the department store guard) suddenly appeared between them. He leaned forward and murmured politely in the Countess’s ear:

“Would you be so kind as to follow me, madam”? . . . She cast a rapid glance around her, her face contorted with anguish. Then, recovering her haughty bearing, she submitted, and walked beside him like a queen who deigns to entrust herself to the care of an aide-de-camp. Not a single customer had even noticed the scene.”

—Patrick Young

War and Diplomacy

On July 1, 1916, two years into World War I, British, British Commonwealth, and French troops launched a massive attack against German lines along a 12-mile front north and south of the Somme River in northern France. In preparation they had subjected the German enemy to a week-long artillery bombardment in which they launched 1.7 million shells; they also had planted 17 mines in tunnels under German trenches, the largest of which contained 21 tons of explosives. On the first day of the attack the British suffered 57,540 casualties, including 585 prisoners of war, 2,152 missing in action, 35,493 wounded, and 19,240 killed. After three days, British battlefield deaths were three times higher than the number killed in 15 years of fighting in the Napoleonic Wars. When the offensive ended in mid-November, French, British, and German casualties numbered close to 1.3 million, making it to that point the bloodiest military campaign in history.

The war in which the Somme offensive took place was a testament to the achievements of countless scientists, engineers, inventors, businessmen, military planners, and government officials in the design, manufacture, and deployment of deadly and efficient instruments of warfare. Armies that had fought in the Napoleonic Wars of the early nineteenth century used weapons, ammunition, and uniforms handmade by skilled artisans and received orders from officers who communicated by shouts, bugles, and messages carried by courriers on horseback. The most advanced artillery could fire two to three rounds a minute and were lethal at no more than 800 yards. Front-loading flintlock guns, standard issue for European armies since the late 1600s, took 26 steps to load, could be fired two to three times a minute, and were accurate up to 100 yards. In World War I, soldiers fought with guns capable of firing 20 rounds a minute with an effective range of 550 yards. They were called rapid-fire guns but paled in comparison to newly developed machine guns, which could be fired 450 to 600 times a minute and had a range of 4,500 yards. Artillerymen now had a variety of guns, howitzers, and mortars to choose from, including the famous German railroad gun introduced in 1918 that was capable of shelling Paris from 80 miles away. Armies made use of barbed wire, land mines, poison gas, wireless radios, tanks, and airplanes. During the Somme Campaign, the Royal Flying Corps of Great Britain lost 782 aircraft and 576 pilots.

Navies underwent a similar transformation in the 1800s. The great ocean battles between England and France in the Napoleonic era were decided by ships of the line, most of which were 170–180 feet (51–55 meters) in length and carried around 75 guns capable of shooting solid

iron shot weighing up to 42 pounds. In World War I, naval fleets included submarines and steam-driven boats of many sizes and purposes but were dominated by dreadnoughts, named after a British battleship launched in 1906. The *Dreadnought* was protected by 1-foot-thick steel armor, was propelled by coal-fired steam turbines, was 527 feet long, and was armed with 5 submerged torpedo tubes, 11 turret mounted guns, and 27 smaller guns.

These were not the only changes in European and U.S. armies and navies in the nineteenth century. All the major powers established or expanded special academies for the training of officers, improved medical services for wounded and retired soldiers, developed systems for housing and provisioning troops, and maintained ministries whose sole responsibility was the military. Armies also increased in size, especially from the 1870s onward, when all the Great Powers except Great Britain introduced conscription systems in which young men served on active duty for several years and then entered the reserves. On the eve of World War I, Russia maintained 4.5 million active and reserve troops, France maintained 4.017 million, Germany maintained 4.5 million, Italy maintained 1.251 million, and Great Britain maintained 975,000. For Europe's Great Powers, military expenditures consumed 25–30 percent of their budgets.

Only one non-Western state, Japan, underwent a military transformation as profound and thoroughgoing as that of Europe. In the early nineteenth century Japan had no national army or navy. The Tokugawa shoguns, ruling from Edo, had their own army, but so too did the aristocratic lords of Japan's 260 provinces. Commoners were barred from bearing weapons, so fighting was the monopoly of the nobility, or samurai. During the long years of Tokugawa peace, however, the samurai became courtiers, administrators, and bureaucrats rather than warriors, and the matchlock guns and smoothbore cannon of Japan's armies became increasingly antiquated. Confrontations with Western powers, culminating

In the early nineteenth century Japan had no national army or navy. The Tokugawa shoguns, ruling from Edo, had their own army, but so too did the aristocratic lords of Japan's 260 provinces.

in the arrival of the American fleet under Commodore Matthew C. Perry in 1853 and the leveling of the Satsuma domain's forts at Kagoshima by the British Royal Navy in 1862, fully revealed the inadequacy of Japan's military. After the overthrow of the shogunate in 1867, Japan's new leaders made military modernization their priority. In 1873 in what is probably the most important step in the modernization of Japan, they ended the military monopoly of the samurai and introduced conscription. By this step, the Meiji government undermined the foundations of Japan's traditional class system and provided itself with the means to indoctrinate its new recruits with the values of nationalism and loyalty to the emperor. Meiji leaders at first relied heavily on Western expertise and weaponry. They made massive purchases of European weapons and recruited European officers to provide instruction on matters of training, recruitment, and strategy. To their credit, Japanese leaders realized that such steps by themselves were not enough to make Japan

a military power. Other fundamental changes—government centralization, the establishment of a nationwide educational system ranging from primary schools to the prestigious University of Tokyo, and rapid industrialization—also were needed. In all, these endeavors by the Japanese were remarkably successful. In 1905 they stunned the world with their victory over Russia in the Russo-Japanese War.

The transformations of European and Japanese armies and navies were not the only important military developments between 1750 and 1914. At the beginning of the period, the diffusion of firearms continued into regions such as northwestern North America, New Zealand, Hawaii, and various regions of Africa. In southern Africa the Zulu leader Shaka (ca. 1787–1828) introduced a new weapon (a short stabbing spear) and new tactics (based on the use of a crescent formation) and fielded an army made up of disciplined troops led by effective officers. His armies set off a military explosion in southern Africa that resulted in the creation of a short-lived Zulu kingdom.

Elsewhere, many states sought to strengthen their military by purchasing or learning to manufacture European weapons and introducing features of European military organization and strategy. These include the Indian kingdom of Mysore in the mid-eighteenth century, the Maratha Confederation in the late 1700s, and the Punjab empire in the early 1800s; Egypt under Muhammad Ali (r. 1805–1848); the Ottoman empire and Persia through much of the nineteenth century; Ethiopia in the late 1800s; and China, from the beginning of the era of Self-Strengthening through the early twentieth century.

Not one of these efforts was successful in the long run. Ethiopia's modernized army defeated its would-be European conqueror, Italy, in 1896 but succumbed to the same foe four decades later. The Indian states, despite their military reforms, were defeated by British East India Company troops and incorporated into the British raj. Egypt's military buildup was scuttled in the 1840s by the European powers, who feared that a strong Egyptian army would be too much of a threat to the Ottoman empire. In Persia, efforts to modernize the military fizzled out as a result of indifferent leadership from the shahs and a weak economic base. Chinese military reformers were hindered by the mistaken dogma of the Self-Strengthening Movement that building a powerful army required importing Western weaponry but no changes in the traditional Confucian political and social order. In 1911 frustrated military officers who recognized the need for more fundamental changes in Chinese society played a key role in the revolution that overthrew the Qing dynasty. Nationalist army officers in the Ottoman empire also played a key role in the events of the Young Turk Revolution, which in 1906 limited the power of the authoritarian sultan Abdulhamid II and in 1909 replaced him with a figurehead, Mehmed V. Like the Chinese revolutionaries, the fiercely nationalist Young Turks were incensed and frustrated by the failures of their leaders to overcome Ottoman military weakness despite more than a century of effort. On taking power they examined all the institutions of their society and sought to change those that stood in the way of strengthening the state. Time was not on their side, however. The regime survived losses in the Ottoman-Libyan War of

1911–1912 and the Balkan War of 1912 but not its defeat in World War I. Like its two allies, Austria-Hungary and Germany, it paid the price for defeat at the Paris Peace Conference. Having been forced to accept the punitive Treaty of Sèvres, the government of Sultan Mohammed VI was overthrown by Turkish nationalists in 1922, thus ending more than 600 years of Ottoman rule.

Whether modernized or antiquated, armies and navies exist to fight, and between 1750 and 1914 they had many opportunities to do so. Hundreds of wars were fought for the same reasons wars have been fought throughout history: to win or defend territory, to realize commercial advantage, to advance a religious principle or political ideology, to uphold national honor, or to fulfill individual ambitions. Each war brought death and misery, some more so than others. The wars of the French Revolution and the Napoleonic era were fought by armies of unprecedented size. Before 1789 the French army had 200,000 soldiers. By September 1794 it had 1.2 million soldiers, of which approximately 800,000 were armed and ready for combat. Napoleon raised 1.3 million conscripts between 1800 and 1811 and 1 million more during 1812–1813 alone. This enabled him to send an invading army of more than 600,000 troops into Russia in June 1812, of whom 40,000 survivors returned to France less than six months later. Napoleon's 600,000-man invading force was larger than the total population of Paraguay when it declared war on its neighbors Brazil, Uruguay, and Argentina in 1864 and 1865. When the War of the Triple Alliance ended in 1870, Paraguay's prewar population was reduced from 525,000 to about 221,000, of which only about 28,000 were men.

After the defeat of Napoleon, the two bloodiest wars of the nineteenth century were the American Civil War, in which 618,000 soldiers died from combat and disease, and the much shorter Franco-Prussian War (1870–1871), in which 184,000 troops were killed and over 400,000

After the defeat of Napoleon, the two bloodiest wars of the nineteenth century were the American Civil War, in which 618,000 soldiers died from combat and disease, and the much shorter Franco-Prussian War (1870–1871), in which 184,000 troops were killed and over 400,000 wounded.

wounded. Both wars strengthened the convictions of American and European peace advocates, who dreamed of a day when nations would put away their arsenals of weapons and settle their disputes by arbitration. Their efforts, backed by individuals from all walks of life and political persuasions, culminated in two peace conferences held in The Hague, Netherlands. The first, called by Tsar Nicholas II of Russia, took place in 1899, and the second, called by the U.S. president Theodore Roosevelt, took place in 1907. By the end of the second conference, which was

attended by 256 delegates representing 44 nations, signatories agreed to prohibit the dropping of projectiles or explosives from dirigibles or airplanes for a five-year period, adopted conventions for the protection of neutral states during war, and agreed not to begin hostilities without a formal declaration of war. The conference failed, however, to pass a resolution requiring nations to submit disputes to a Permanent Court

of Arbitration, and on the issue of disarmament, delegates could agree only that it required further study.

Meanwhile, between 1899 and 1914 the Boer War, the Spanish-American War, the Russo-Japanese War, two Balkan Wars, the Libyan-Ottoman War, the Philippine-American War, and the Yaqui Indian War all were fought, in addition to civil wars in South America and armed rebellions in various colonies. The arms race continued, with the main event being the naval competition between Great Britain and Germany. Nationalist passions intensified. Political

leaders sought security by entering alliance systems that turned Europe into an armed camp, with Britain, France, and Russia on one side and Germany, Austria-Hungary, and Italy on the other. Each year brought a new crisis, and generals made elaborate plans for the great war that everyone anticipated. Then, on June 28, 1914, the Archduke Ferdinand and his wife Sophie were assassinated by a Serb nationalist while visiting Sarajevo in the Austrian-controlled province of Bosnia. In this crisis diplomacy failed, and one month later World War I began.

—James H. Overfield

■ Introduction: Planning and Organizing for War in Western Societies

In the early 1900s, armies and navies in the Western world had the same purpose as those that had fought in the Seven Years' War (1756–1763) some 150 years earlier. They existed to provide the force deemed necessary to achieve the economic and political goals of the states that organized them. In almost every other way, however, the armies and navies of the early twentieth century differed from their eighteenth-century predecessors. Significant changes began in the 1790s during the wars of the French Revolution and Napoleon and accelerated in the 1800s with the introduction of new military technology, new approaches to organization and recruitment, and new thinking about strategy and tactics.

The Seven Years' War was the last in a series of limited wars that had been the norm in Europe since the end of the religious wars of the sixteenth and seventeenth centuries. Wars in the late seventeenth century and the eighteenth century were fought by relatively small professional armies that followed cautious strategies to achieve specific territorial or economic gains rather than some religious or ideological goal. Soldiers, many of whom had dubious backgrounds as prisoners, debtors, or minor criminals, were recruited mainly from rural households. Their officers were drawn from the

ranks of the titled nobility, who trained their troops to fight with muskets to which bayonets were attached. In battle, two lines of infantry advanced toward one another, with the forward troops unleashing a massive volley and then retreating to the rear to reload while another line of troops took their place. There was a similar formality in naval tactics, with ships entering battle arranged against one another in long lines so they could fire broadsides at the enemy without damaging their own ships. Of the two major naval powers, France and Britain, French admirals adopted a conservative strategy designed to avoid pitched battles that might increase Britain's advantage in terms of the number of ships.

Armies and tactics both changed dramatically between 1792, when the revolutionary government in France went to war with Austria and Prussia, and 1815, when the Napoleonic Wars ended. The most significant change occurred in 1793, when the French National Assembly, faced with internal and foreign threats, declared a *levée en masse*, which resulted in the conscription of all single men between 18 and 25 years of age for military service. The revolutionary government also established new armament factories, ordered the collection of scrap metal to forge new weapons, and imposed wage

and price controls. This was a far cry from the limited wars that Europe had fought in the eighteenth century.

The concept of a nation in arms was only one of the innovations introduced by the French. The idea that military command was something reserved for members of the titled nobility gave way to a new approach that awarded commissions and promotions on the basis of talent rather than age and social background. The army itself was organized differently. The eighteenth-century practice of maintaining separate units of infantry, cavalry, and artillery gave way to a new structure, the division, a force of from 10,000 to 12,000 men that included units of all three branches. Such a configuration provided a number of logistical advantages and gave commanders greater flexibility in planning campaigns and fighting battles. The increased use of light mobile field artillery and the abandonment of arranging infantry soldiers in long lines in favor of arranging them in columns gave rise to a distinctive new French school of warfare characterized by speed, aggressiveness, and flexibility.

These changes all had been introduced before the French armies came under the command of one of the most extraordinary and successful generals in history, Napoleon Bonaparte. Between 1796, when he assumed command of the Army of Italy at age 27, and 1815, when he fought his last battle at Waterloo, he led the French army in over 50 battles and lost only seven. Such a record became the subject of study and analysis not only by rival generals but also by countless nineteenth-century military theorists who sought to understand the reasons for his success. Following the argument developed in the theoretical and historical works of the Swiss-born Antoine-Henri Jomini (1779–1869), most military thinkers, including the widely read Carl von Clausewitz (1780–1831), concluded that along with high troop morale, accurate intelligence, speed of movement, and aggressiveness, the key to battlefield victory was to bring mass forces against the enemy's weak point in one decisive blow. Napoleon had written in 1804: "Remember these three things: unity of forces, urgency, and firm resolution to perish in glory. These are the three great principles of the military art that have brought me success."

In the immediate aftermath of the Napoleonic Wars, Europe's armies were reduced in size, mass conscription was abandoned, and leadership once more became an upper-class monopoly. Prussia was the one exception to the practice of maintaining long-service professional armies in which those who volunteered or were drafted could expect to serve a minimum of anywhere from 8 to 25 years. In Prussia a much larger percentage of the population was drafted, but a new recruit served only two years in the regular army before passing into the reserves.

Beginning in the 1830s, military planners were forced to come to terms with rapidly changing technologies. Improvements in firearms and artillery meant that hardly a decade passed without armies having to discard their outdated weapons and purchase new ones. Navies also changed rapidly. The abandonment of sails for steam engines and developments in naval ordnance increased navies' offensive capabilities and inevitably led to innovations in defense, including an emphasis on armor and new hull designs. Naval arms races occurred after the French launched *La Gloire*, a propeller-driven iron-plated warship, in 1859 and after the Germans embarked on a program of naval expansion in the late 1890s.

Further changes followed the rapid growth of railroad and telegraph networks in the 1850s and the decisive Prussian victories over the Austrians in the Austro-Prussian War of 1866 and over the French in the Franco-Prussian War of 1870–1871. The Germans' ability to move troops rapidly to the front according to meticulously planned schedules confirmed the importance of railroads. The Prussian victory also marked the demise of the small long-service professional armies that had been the norm since 1815. The new model was the Prussian system of an army made up of short-service conscripts and reserves under the leadership of highly trained general staff officers who directed troop movements, planned logistics and communications, and developed overall strategy. The Prussian victories also underscored the importance of numbers. When the war with France began, Prussia could field an army of 1.2 million soldiers, making possible the encirclement and defeat of the French army at the decisive Battle of Sedan.

The stage was now set for the rapid developments of the late nineteenth and early twentieth centuries. Armies grew in size, governments spent increasingly enormous sums on new weapons and ships, and diplomats hammered out alliances in anticipation of major war that was considered inevitable. Staff officers devised detailed plans for mobilization and opening campaigns in preparation for the same expected war. Having studied Napoleon and the Franco-Prussian War and having read the books of Jomini and Clausewitz, they all agreed that bold offense, massive numbers of troops, and a quick decisive battle would lead to victory. When war came in 1914, however, not a single one of these assumptions proved true.

—James H. Overfield

European Armies in the Old Regime

The period between the end of the Thirty Years' War in 1648 and the rise of the *levée en masse* during the French Revolution was unique in military affairs, seeing the rise of dynastic armies of the Old Regime and an unprecedented level of formality in the conduct of campaigns. The new armies arose from the absolute monarchs' desire for centralization and a general rejection of the excesses of the wars of religion. They were standing armies, built around gunpowder-based infantry units and subject to rigid codes of discipline and conduct both in garrison and on campaign. The expense of equipping and training these forces made kings reluctant to risk them in pitched battles, resulting in a style of warfare based on maneuver and siege.

The Thirty Years' War was a laboratory of early modern military science, demonstrating both the wanton destructiveness of unreliable mercenary forces paid through plunder and the advantages of long-service troops under Crown discipline. Increasingly during the latter half of the seventeenth century kings played variations on the theme introduced by the Swedes and the Dutch Republic by creating standing armies of professional soldiers. These forces were particularly attractive to absolute monarchs, not only as tools of defense and state expansion but also as tools of internal coercion and diplomatic intimidation.

The Battle of Maxen was fought in the German state of Saxony in 1759, during the Seven Years' War. It was a crushing defeat for the Prussians who were outnumbered by the enemy Austrians and forced to surrender their entire army. (Erich Lessing/Art Resource, NY)

Armies became progressively larger as kings developed the bureaucracies needed to supply and finance them. Louis XIV of France fielded an army of almost 400,000 men during the War of the Spanish Succession (1701–1714), and Frederick the Great put 163,000 men (some 3 percent of Prussia's total population) in uniform during the Seven Years' War (1756–1763). Most of these troops manned elaborate fortresses constructed along frontiers and principal waterways. Field armies were limited in size to about 50,000 men due to the logistics of supply and the limitations of forage opportunities.

The armies of the Old Regime represented the highest and lowest ranks of society. The officer corps was staffed from the hereditary nobility with the exception of the technical fields of engineering and artillery, which drew their officers from the educated middle classes. The rank and file were recruited or conscripted from the lowest rungs of the socioeconomic ladder. Pay was low, often late, and subject to stoppages for upkeep and equipment expenses. Living conditions in the barracks were often below the standards mandated by law for prisons. The troops were subject to ruthless discipline designed to produce instant obedience to orders and stoic indifference to casualties. This harsh discipline and the brutal conditions of service made desertion a constant problem, so much so that some commanders avoided night marches, extensive

THE EXCEPTION OF ENGLAND

While the absolute monarchs of the continent created armies that were extensions of the royal will, England pursued a different pattern. England had rejected absolutism with an axe on January 30, 1649, with the execution of Charles I and had emphasized the point with the almost bloodless Glorious Revolution in 1688, getting rid of James II. In addition to kings who exhibited absolutist tendencies, England had also endured the virtual military dictatorship of Lord Protector Oliver Cromwell during the Interregnum. These experiences left Parliament wary of the coercive power of a standing army. Although Parliament left the command of the army to the Crown, they claimed the power of the purse in military affairs and voted only a modest annual budget for the army. The army thus became the stepchild of the state, unloved, often neglected, and generally resented unless there was an unpleasant task to be done.

—Melvin Smith

foraging operations, and even pursuit of a fleeing enemy as they offered too many opportunities for absconding.

The infantry was the core of the armies of the Old Regime, supported by artillery and cavalry. The artillery of the day was cumbersome and once emplaced was rarely moved during a battle. Cavalry was useful for scouting and for pursuit of a broken enemy, but cavalry could not break well-led infantry. Thus the infantry weapons of the era dictated tactical deployment of an army. The standard sidearm was a smoothbore flintlock musket that had a lethal range of about 150 yards (137 meters) but lacked any kind of accuracy at any range. It was tipped with a socket bayonet. The most effective use of the weapon was volley fire at close range delivered from (by modern standards) tightly packed formations. With two armies blazing away and then closing with the bayonet, heavy casualties were not uncommon.

Because these armies represented a substantial investment for any king, they were generally reluctant to risk them in a set-piece battle. Campaigns consisted of elaborate maneuvers to achieve surprise or local superiority. Often the

objective was not to seek out the enemy army but instead to threaten his lines of supply or lay siege to his fortresses. A successful campaign could be reckoned as a season spent foraging off the enemy's territory without firing a shot.

European Navies in the Old Regime

European navies came into being as European economies became increasingly involved in maritime trade in the fifteenth century. By 1700 these navies had evolved from a form of seagoing militias into professional services with specialized vessels. The capital outlay to build and maintain such navies was an enormous and ongoing expense that made true blue-water fleets an option open only to the strongest of the maritime economies. For financial and geographic reasons Britain became the primary European naval power by the end of the Napoleonic Wars.

Following the Ottoman capture of Constantinople in 1453, European maritime trade gradually shifted west. This trend accelerated with the discovery of the New World and establishment of direct trade with Asia, and the value of the cargoes increased exponentially. National economies were built on spices and tea from the Orient and gold, silver, and furs from the Americas. Protecting these merchantmen became a priority, and preying upon the trade of an enemy nation became an accepted tool of warfare. Both required armed ships.

The initial navies were composed of a core of state-owned vessels augmented in time of war with armed merchantmen and privately owned

warships issued with letters of marque, which allowed them to legally prey on enemy shipping as a sort of seagoing militia. The merchantmen and privateers often proved reluctant to press home an attack when a battle hung in the balance. As a result, nations turned to professional fleets with purpose-built warships.

By 1700 three distinct types of warship were commonplace. Line of battle ships, or ships of the line, had at least 60 guns on at least two gun decks, with the largest carrying more than 100 guns. These largest first rates carried a crew of 800 to 1,000 men. Frigates, with 32 to 38 guns on a single gun deck, were the workhorses of any navy, serving as fleet scouts, commerce raiders, and convoy escorts. Sloops of war were the smallest naval vessels, armed with about 20 guns mounted on the open-weather deck.

Building a navy represented a tremendous capital outlay, and unlike raising a land army, the expense was a long-term investment. While most of a crew could be paid off at the end of hostilities, the ship still required upkeep even if mothballed, and some of the specialists in the crew could not be readily hired and fired. Naval dockyards and port facilities became more specialized along with the evolution of the ships they served. Only states with a significant merchant marine could justify the cost of an ocean-going blue-water fleet, and only the most solvent of governments could afford one.

Navies represented a significant drain on skilled and specialized nautical manpower, so much so that even in intensively maritime states there were not enough sailors to meet the demands of the fleet, the merchantmen, and the privateers. As service in the latter two paid better and was not as dangerous, governments were hard-pressed to provide warship crews. Thus the volunteer core of the navy was leavened in time of war with sailors press-ganged from ports or seized from merchant ships stopped at sea and filled out with unskilled landmen scraped from inland jails. The commissioned ranks in the navy were less landed and aristocratic than in the army; life at sea was harsh and technically demanding for the officers as well.

Britain generally maintained naval supremacy throughout the eighteenth and nineteenth centuries. Following the reverses of the

Captain Charles Brisbane's quartet of Royal Navy frigates surprise the Dutch defenders at Willemstad, Curaçao, on January 1, 1807, during the Napoleonic Wars. (David Marley)

> HORATIO HORNBLOWER AND "LUCKY JACK" AUBREY—FICTIONAL HEROES OF NAPOLEONIC NAVAL CAMPAIGNS

The last great fleet engagements of the navies of the old regime took place during the Napoleonic Wars. Two series of historical novels set in this age capture the exuberant essence of life at sea in the King's Navy. The older series by C. S. Forester chronicles the career of the socially awkward but militarily valiant Horatio Hornblower from midshipman to admiral. The more recent series was penned by Patrick O'Brian and traces the travels and exploits of "Lucky Jack" Aubrey and his doctor (and sometime spy) Stephen Maturin. Both dashing captains have made it to film, with Hornblower first being played by Gregory Peck on the big screen (1951) and later by Ioan Gruffudd in a made-for-television miniseries (1998–2003). Russell Crowe played Aubrey opposite Paul Bettany as Maturin in *Master and Commander: The Far Side of the World* (2003). All the novels are worth reading, and all the films are worth seeing.

—Melvin Smith

American Revolution, fully 40 percent of the budget was devoted to rebuilding the navy in 1784–1785. Britain was willing to make these expenditures because so much of its national economy was based on maritime trade, and in turn the strength of that economy provided the revenues needed. Britain's unique insular nature

allowed it to concentrate on naval affairs rather than building up land forces for defense, and the location of the British Isles provided an excellent base of operations for projecting power along the Atlantic coast of Europe.

The “Nation in Arms” — The French Army and the French Revolution

Once the revolutionaries in France proclaimed a republic in 1792 and executed King Louis XVI in January 1793, they were faced with the problem of defending the revolution from a hostile

coalition comprising almost all of the other Great Powers of Europe. In response, the revolutionaries resorted to a radical new approach to army organization. Unlike the small professional armies that opposed them, they proclaimed a *levée en masse*, or mass conscription, in August 1793. For the first time in history, conscription was used to raise the entire armed forces of a country, and this new French army had an immediate and decisive impact on the Revolutionary Wars of the 1790s.

The *levée en masse* comprised a conscription of the entire French society for war. In addition to forcing young bachelors into the army, the measure forced other men to work creating the weapons of war, while women and children made the uniforms, sacks, and other equipment required of the troops. Even the elderly were conscripted to preach to the people the virtues of the revolution and hatred of their enemies. Through such propaganda, the revolutionary leadership sought to encourage war enthusiasm and nationalism and thus unite the entire country behind the war effort. The result of the *levée en masse* was that unlike its enemies, every segment of French society was focused on the one objective of defeating its opponents. By 1794 the army numbered 800,000, dwarfing the smaller armies in the rest of Europe.

The imposition of conscription was not without problems. Opposition to conscription was particularly widespread among the peasantry, and many failed to report for duty or deserted after joining the army. In the early 1790s the desertion rate reached 200,000 per year, and some of those opposed to conscription joined counterrevolutionary forces in France. However, with France's large population, these deserters could be easily replaced. In battle the new French army suffered significant numbers of casualties, as the new tactics adopted by the generals normally involved bayonet charges. Although the French losses were great, dead or wounded soldiers could be replaced, while those of their enemies could not. The sheer size of the French army allowed it to overwhelm its opponents. At battles such as Jemappes and Valmy in the early 1790s, the conscripted French army proved its superiority to the professional armies it faced. The victories won by the conscripts of France

The Battle of Jemappes, near Mons, Belgium, November 6, 1792. The French Revolutionary Army defeated the greatly outnumbered Austrian Army, the first victory by a mass republican French army. (William M. Sloane, The Life of Napoleon Bonaparte, 1909)

LAZARE CARNOT, ORGANIZER OF THE *LEVÉE EN MASSE*

Lazare Carnot (1753–1823) was a French politician and mathematician who became a delegate to the National Convention in 1792 and a member of the Committee of Public Safety in 1793. In this post he organized the *levée en masse* and oversaw the operations of the French armies on the battlefield. His numerous successes in this role earned him the sobriquet “Organizer of Victory.” Politically a moderate, he was one of the

original five members of the Directory but was dismissed in 1797 and took refuge in Geneva. In 1800 he was appointed minister of war by Napoleon, but his republican sympathies were increasingly out of step with Napoleonic France, and he retired from public life. After the restoration in 1815, Carnot went into exile and died in Magdeburg.

—Wesley Ferris

ensured the survival of the revolution and laid the foundations for the expansionism of the late 1790s and the Napoleonic era.

Recruitment and Conscription

The French Revolution showed the value of mass conscription to modern warfare, but it was the Franco-Prussian War of 1870–1871 that conclusively demonstrated the importance of a large army comprised of well-trained and skilled conscripts. In the aftermath of the Franco-Prussian War, most of the Great Powers of Europe remodeled their armies along the lines of Prussia, with significant consequences for subsequent military history.

Universal conscription first appeared in Europe during the 1790s as part of the military reforms adopted by Revolutionary France in order to defend the French Revolution and defeat the monarchies of Europe. It allowed France to field an army that dwarfed the small professional armies of its rivals and was an important component of the victories won by France during the Revolutionary and Napoleonic periods. In response, France’s enemies reformed their armies

and incorporated many of the reforms made by France including conscription, which aided the eventual defeat of France in 1815.

Although the European states abandoned conscription and returned to smaller armies after the Napoleonic Wars, Prussia again demonstrated the value of conscription in the 1860s. Among the many military reforms that Prussia adopted in the 1860s was conscription, which allowed this emerging German state to field a 1 million-man army after the Austro-Prussian War of 1866. Prussia’s crushing victory over France in the Franco-Prussian War of 1870–1871 was seen in the rest of Europe as a vindication of Prussia’s military reforms, including conscription.

Between 1871 and 1914 almost all of the Great Powers of Europe adopted some form of conscription, leading to mass armies that in some cases numbered in the millions. Even smaller nations such as Sweden and Belgium adopted universal service. Only the United Kingdom did not impose peacetime conscription, in large part due to its reliance on its navy for defense, although pressure for conscription increased even in the United Kingdom after the failures of the Boer War.

Conscription and the size of the armies it created became a critical focal point in the international rivalry that preceded World War I, as military prowess came to be measured by the size of a country’s army. For example, in the years prior to 1914, a declining birth rate was of increasing concern to the French government, as it indicated a decrease in the number of future conscripts in comparison to its German

➤ ALBRECHT GRAF VON ROON

Albrecht Graf von Roon (1803–1879) was a lifelong officer in the Prussian army who, after serving on the General Staff, was appointed war minister in 1859. In this post he carried out, over the widespread objections of Prussian liberals, a comprehensive reform of the Prussian army, arguing that modern warfare required professionalism and thoroughly trained soldiers. To achieve this von Roon instituted universal conscription, which doubled the size of the Prussian army by 1862. In addition, he subordinated the Landwehr, a middle-class national guard that had its origins in the militias raised in 1813 to fight Napoleon, to the regular army. These reforms greatly strengthened the Prussian army and were an important contribution to the Prussian victories over the Austrians in 1866 and the French in 1871. Kaiser Wilhelm I made von Roon a count in 1871 and promoted him to field marshal in 1873, a year after his retirement.

Europe's Arms Race before World War I

During the four decades preceding the start of World War I in 1914, European nations engaged in a multifaceted arms race, building larger armies and navies and eagerly seeking new or improved weapons. Industrialization and new manufacturing techniques not only allowed the development of new weapons systems, but the efficiency they produced also allowed nations to create larger standing armies without reducing industrial output. Rising populations also contributed to the size of European armies. As empires expanded and territorial competition intensified on the continent and abroad, many industrialized European nations adopted a conscription and reserve system, giving them a pool

of trained military personnel who could be mobilized rapidly at the onset of war.

During the latter half of the nineteenth century great advances took place in science and industry. Better metallurgy provided stronger steel and more economical methods of producing it, allowing the construction of more powerful artillery and rifles. Better steel also spurred the design of larger warships with thicker armor and heavier guns. Precision machining techniques produced weapons that packed more punch, delivered that punch at greater ranges, and put that punch on target with greater accuracy. Germany led the way in the newly developed chemical industries, which provided stronger explosives and propellants for the new weapons. By 1910 quick-firing artillery, magazine rifles firing smokeless powder cartridges, and machine guns were standard issue in European armies. In many cases these acquisitions were the result of a sort of positive feedback loop: if Country A developed a new technology, Countries B and C would either follow suit to keep up or develop some other counterforce to negate Country A's advantage. Country A would respond by seeking to reestablish superiority, setting off another round of mutual military increases. Competition grew fierce as the turn of the century approached, and the size of an army or fleet became an important consideration during negotiations between the Great Powers.

In addition to adopting new weapons, European militaries expanded their numbers radically during the quarter-century preceding the war. Populations had grown due to better medicine and agriculture, and new manufacturing techniques were more efficient and less labor-intensive. These factors gave European governments the ability to place more men in uniform than ever before. Most nations (with the exception of Britain among the Great Powers) adopted some form of conscript and reserve system in which young men were drafted, trained, and, after a brief term of active duty, passed on to reserve formations. This system created truly massive armies on the continent. In 1914 Germany could call up 4.5 million men, while France fielded a standing army and reserve of just over 4 million. Russia's massive population provided an army of 5.9 million men, and Austria-Hungary faced them

THE KAISER'S FLEET

The most visible aspect of the European arms race centered on building battleships. These massive heavily armored and armed ships were technological marvels and were seen as an indication of the wealth and industrial might of the nations that possessed them. Britain had been the leading naval power for decades as the century drew to a close, but in Germany both Kaiser Wilhelm II and Admiralty secretary Alfred Tirpitz had visions of building up the German fleet to establish parity with the British in the Atlantic. The German Fleet Laws of 1898 and 1900 provided massive funding for a naval building program that would double the number of German battleships by 1916. Kaiser Wilhelm and Tirpitz expected that the fleet increase would benefit Anglo-German relations, forcing the British to respect Germany's potential as an enemy and court Germany as an ally to counter France and Russia, Britain's main colonial rivals. The British reaction was the exact opposite, driving public opinion further toward outright alliance with Russia and France. It touched off an increase in naval building in British shipyards and generated a revolution in battleship design with the launch of the all big-gun HMS *Dreadnought* in 1906.

—Melvin Smith

with 3 million. Italy, aspiring to Great Power status, had 1.251 million men trained in 1914.

More impressive than the raw numbers themselves are the percentages they represent. Lightly industrialized Italy had a 1911 population of 35.4 million; its army represented 3.5 percent of the total population. Russia had a 1910 population of 160.7 million, meaning that some 3.7 percent of Russia was in uniform when the war began. Slightly more industrialized Austria-Hungary claimed a 1910 population of 51.4 million; it was able to train and equip 5.8 percent of the population by the time war broke out. Germany, with a 1910 population of 64.9 million, fielded an army that represented 6.9 percent of the nation. Despite later derision of Prussian militarism, the ratio in France was even higher. France's 1901 population stood at 38.5 million. Even allowing for some population increase by 1914, this meant that its army of 4.017 million

The German battleship *Kaiser Wilhelm der Grosse*, about 1903. (Naval Historical Center)

men army comprised more than 10 percent of the total population. Considering that half the population was female and that roughly half of the male population was too young or too old to be in uniform, these figures indicate that by 1914 more than 60 percent of Frenchmen of military age were in the military, either on active duty or in the reserves. Europe had become an armed camp of mutually antagonistic alliances and counteralliances, primed for a massive conflict.

Naval Strategy in Europe, 1750–1800

During the last half of the eighteenth century, the “age of fighting sail” reached its climax. In these decades, the Royal Navy of Great Britain was challenged by the navies of other western

European countries in three major wars. However, by the early 1800s, when Admiral Horatio Nelson (1758–1805) defeated a combined French and Spanish fleet at the Battle of Trafalgar, the British established a nearly complete control over the oceans.

In 1750, Great Britain, without a large standing army, maintained the world’s largest navy, used mainly to protect its position in worldwide commerce. France, the leading military power in Europe, maintained a navy about one-third the size of Britain. The other major naval powers were Spain and the Netherlands, whose navies were smaller still. Other European countries had only minor naval establishments.

The relative power of each nation was based mostly upon the ships of the line each could place at sea, along with smaller supporting vessels. The training and abilities of the officers and men in each navy also played an important role. The British ships of the line were large warships capable of fighting line battles, in which two columns of opposing ships maneuvered to most effectively bring to bear their broadside guns on the enemy. In such battles it was generally thought that larger ships had the advantage, although designers had to strive for a balance between size and firepower on the one hand and maneuverability on the other. In the eighteenth century most ships of the line were “74s,” referring to the number of guns they carried. While British ships were not materially superior to their opponents, the Royal Navy was much more aggressive than their opponents. Line battles tended to be indecisive, with few ships lost, but British commanders were more likely to take chances to break their opponents’ lines of battle, resulting in decisive victories. French and Spanish commanders used more conservative, defensive strategies.

Conflicting claims between Britain and France in North America resulted in open warfare in 1754. The French and Indian War, as it was known in North America, was subsumed in the Seven Years’ War that broke out in 1756. At sea, this war was fought mostly in the waters near the North American and Caribbean colonies of Britain and France. British squadrons kept a close watch on French ports and tried to intercept French squadrons as they attempted to convey men and supplies to the American

colonies. Despite considerable losses, the British largely succeeded in their task. When the British and American colonists took the French fortress of Louisbourg in 1758, the French squadron was trapped there and destroyed. The Royal Navy also played an important role in the capture of Quebec in 1759 and Martinique in 1761. When the Spanish entered the war in 1762, the Royal Navy also captured Havana and destroyed most of the Spanish ships stationed in the Americas.

The Treaty of Paris ended the Seven Years' War on February 10, 1763. Great Britain received Canada and other territorial concessions, and its navy was regarded as supreme. France and Spain, however, sought revenge, and both countries began to rebuild their navies. For their part, British governments neglected to maintain the fleet or to build new ships. By 1778, the French could place nearly as many ships of the line at sea as the British, and the Spanish navy was nearly as large.

Between 1775 and 1778, the Royal Navy's major duty was to support the British army's attacks on American rebels. A comprehensive blockade of American ports was not enforced, allowing French military supplies to reach the Americans. In July 1778, the French openly entered the war, and within a year, the Spanish also declared war on Great Britain. In the summer of 1779, a Franco-Spanish fleet of 66 ships of the line seized control of the English Channel, and a much smaller British squadron was forced to take shelter in harbor. The allies were unable to use their advantage to invade England, but the Royal Navy was unable to maintain command of the sea. When the Netherlands joined Britain's enemies in December 1780, the Royal Navy was forced to commit ships and men to guard against the Netherlands' fleet.

Thanks to French sea power, the American and French armies forced the surrender of Cornwallis at Yorktown in October 1781. From that point, American independence was virtually certain. A British victory over the French at the Battle of the Saintes on April 12, 1782 managed to preserve British Caribbean possessions. The net result, however, was to turn the naval war into a draw rather than a British defeat.

The final conflict of the period was the series of wars between revolutionary and Napoleonic

The decisive British victory at the battle of the Nile left Napoleon's army stranded in Egypt in 1798. The battle for control over the seas between Great Britain and other European states culminated in the French Revolutionary and Napoleonic wars with complete victory for the British. (James Stanier Clarke and John McArthur, The Life and Services of Horatio, Viscount Nelson ... from His Lordship's Manuscripts, 1840)

France and Great Britain. War broke out between Great Britain and France in 1793. The French Navy had declined greatly from its zenith in 1783. The officer corps had been depleted by the loss of its noble officers, and many ships of the line had been lost when in August 1793 the French port of Toulon was seized by counterrevolutionaries and the Royal Navy and held until late in the year. At first, however, the British failed to capitalize on their advantages. The French took the initiative and gained an ally when Spain joined the French in 1796. The outnumbered Royal Navy concentrated on home defense. More aggressive tactics resulted in victories over the Spanish at the Battle of Cape St. Vincent and over the Dutch at Camperdown in 1797. The following year, Nelson virtually wiped out the French Mediterranean fleet at the Battle of the Nile. These victories combined and an improved blockade strangled French commerce. The Peace of Amiens in 1801 allowed a brief respite to France, but when war broke out again in 1803, the Royal Navy was prepared materially and doctrinally to exert real control over the sea. French and Spanish colonies around the world were captured by the British. A last serious effort to break the British stranglehold in 1805 failed when a combined Franco-Spanish fleet was defeated off Trafalgar by Horatio Nelson's squadron. Although Nelson was killed in the victory,

Trafalgar ended any serious naval challenge to Great Britain for most of the nineteenth century.

Theories of Land Warfare, 1750–1789

There was no great revolution in military affairs between 1750 and 1789, but there were minor innovations and refinements. The armies of the Old Regime reflected the states that they served: rigid, hierarchical, and thoroughly regimented. War was a formal exercise of the strength and will of kings, an extension of dynastic ambitions. The most important and prolific military writer of the age was Prussian king Frederick the Great; other writers either followed his lead or devised ideas to counter his innovations. It was the epitome of the age of limited warfare.

The new technologies of war introduced during the seventeenth century had thoroughly redesigned the military paradigm in Europe. Gone were the pike formations that had dominated the battlefields of the wars of religion. Cavalry was no longer the decisive arm, having been demoted by the rise of a musket-and-bayonet infantry. Artillery was becoming less of an art and more of a science. There was no introduction of a new military technology that forced a massive shift in tactics or strategy during the period in question. What happened instead was a refinement of tactics and strategy as the limits of the available technology and formations it required were explored and exploited.

The armies of the day were a reflection of the absolutist states that produced them. Officers

were drawn from the hereditary nobility and were the only members of the military who had any vested interest in maintaining the system they served. The other ranks were drawn from the lowest social orders, often through conscription. For them war was a profession, a business; they did not enlist out of a sense of duty to the state or to a cause.

The most successful commander of the era was Frederick the Great. Ruling a nation of limited resources, he sought efficiency at all levels of military affairs. He called for short and lively wars seeking a speedy decision of the conflict. But at the same time, actual battle was a chancy proposition; the army had to be rigorously trained and rigidly disciplined to be an extension of the commander's will, but that discipline and control could evaporate in the heat of a major battle. Thus, the objective of a campaign was not to seek the decisive battle to annihilate the enemy's main field force but rather to force the enemy to move, to yield a position of advantage. War was an exercise of position, of complex maneuvers, and of the subtle acquisition of incremental gains close to the frontier, not of deep penetrations and pitched battles.

France was on the losing side of both the War of the Austrian Succession and the Seven Years' War, and as the latter involved significant territorial losses, a rethinking of French doctrine seemed to be in order. Artillery, which Frederick the Great ranked as an "auxiliary rather than an 'arm'" (although he did have a lot to say about its proper employment and mobility), underwent a dramatic change in France following 1763. Artillery chief Jean-Baptiste de Gribeauval designed lighter cannon with bored (rather than cast) barrels, producing a weapon that was more mobile, more accurate, and more powerful. Chevalier Jean du Teil drafted plans to group cannon into larger batteries that were to concentrate on savaging the enemy's infantry rather than on counterbattery duels.

France also sought innovation in infantry tactics. Where Frederick the Great believed in the *ordre mince*, a tightly controlled line of three ranks that optimized infantry firepower, France experimented with *ordre profond*, infantry arrayed in dense columns. Ultimately, the French armies of the revolution employed the

ordre mixte, first proposed by Comte Jaques-Antoine de Guibert in 1772, that combined the mobility of columns with the firepower of the line and offered a variety of options for the commander on the field. France also embraced the use of skirmishers, light infantry that fought in open order, as opposed to Frederick's massed battalions.

France also laid the groundwork for the adoption of the division as a primary military unit. Pierre de Bourcet theorized on breaking an army into smaller subdivisions that marched separately along different routes to concentrate on an objective for mountain campaigns. Marshal Victor-François de Broglie put the theory into practice during the Seven Years' War, although when peace returned the divisions disappeared. All of these ideas, however, found their way into France's military by 1795 and provided the basis for Napoleon Bonaparte's stunning successes as he fine-tuned these basic ideas and introduced a few new concepts of his own.

Napoleon as a Military Strategist

Few names loom larger in the history of warfare than that of Napoleon Bonaparte, the Corsican of the lesser nobility who rose to command France and conquer most of Europe during the first 15 years of the nineteenth century. Much of his success came from his ability to integrate existing ideas into a uniform military doctrine. He also introduced his own refinements and concepts

that produced a potent military that almost defied the collective might of the rest of Europe. That Napoleon had talent is evident. That he had ambition is undeniable. That he was a great revolutionary in military affairs is a subject of debate.

Napoleon's career began when he entered the Royal Military School at Brienne at age 9. After graduation he entered the École militaire in Paris, completing the two-year course of study in a single year (graduating 42nd out of 58 students). In 1785 the 16-year-old second lieutenant reported to his first posting with the La Fere artillery regiment. In 1788 he came under the tutelage of master artillerist Baron Joseph du Teil. During all of these years Napoleon read voraciously on military affairs, embracing the Prussian king Frederick the Great's emphasis on central position, de Broglie's concept of the division as an operational unit, and Guibert's theories on flexibility and mobility in war. Napoleon also studied the writings of Pierre de Bourcet,

➤ NAPOLEON'S HEROES

Although Napoleon never wrote a treatise on his formula for military success, he often commented on military planning and strategy in his voluminous correspondence. In this passage from one of his letters he singled out for praise four "great captains" he admired.

"No great actions are the product of chance and luck; they must always proceed from calculation and genius. Rarely does one see the great men fail in their most perilous enterprises. Consider Alexander the Great, Caesar, Hannibal, Gustavus Adolphus, and the other Great Captains. They always succeeded. Is it because they were lucky that they thus became great men? No! But being great men, they knew how to master chance. When one desires to study the sources of their success, he is quite astonished to see that they have done everything to obtain it."

—Melvin Smith

Source

Jay Luvaas, ed. and trans., *Napoleon on the Art of War* (New York: Touchstone, 1999), 30.

whose treatise on mountain campaigns provided the genesis of Napoleon's success.

In August 1793 Napoleon was a captain of artillery. Two and a half years later he was commander of the French army in northern Italy. Using many of the ideas of Bourcet, Napoleon divided his forces into divisions that marched separately toward an objective and combined forces for battle. His divisions lived largely off the land by requisition and waged an aggressive war of movement, as envisioned by Guibert. By April 1797 as a result of Napoleon's campaigns, Piedmont had been defeated, and Austria had been driven from the war.

Napoleon's greatest strength as a strategist was the ability to translate theory into practice and create a unified whole from disparate parts. He held some advantages over earlier commanders. He was a military prodigy with an ability to grasp an enemy's intent quickly, and he possessed an appreciation of the impact of terrain on both battle and strategic movement and the flexibility to adapt to new situations and seize a sudden opportunity. That being said, the armies he commanded were of a different mold than the dynastic armies of the previous century. The French Revolution introduced a patriotic element into the rank and file that had not existed before. While the armies of Frederick the Great were likely to dissolve through desertion had he relied on foraging, Napoleon could count on most of his men coming back when sent to requisition supplies. For the same reason, Napoleon could exploit a victory with a destructive pursuit of the broken enemy, a feat that the Prussians could not accomplish.

It did not hurt matters that Napoleon was in supreme command of France. This allowed him to impose changes from above rather than fight an entrenched bureaucracy. Where de Broglie had experimented with divisions, Napoleon institutionalized the system and imposed it on the French military as a whole. He developed the concept a step further, introducing the *corps d'armée*. A corps consisted of several divisions under the command of a small staff. It was self-contained, with its own infantry, cavalry, artillery, and support units, and fully capable of independent operations. Mutually supporting corps advancing along parallel tracks gave

several advantages to a commander and were an integral component of Napoleon's basic strategy. Since the corps advanced through separate areas, they could depend on requisition for much of their consumables, reducing the logistical tail and increasing speed and mobility. Napoleon's armies could penetrate deeply into an enemy state and bring about a decisive battle.

During the eighteenth century, wars were protracted affairs of maneuver, with the risky pitched battle being a rare thing. Napoleon sought the exact opposite, preferring to march an army deep into enemy territory, threatening some vital asset to bring the enemy's forces to battle. Once the main force of the enemy's field army had been defeated, the emperor could impose terms on his opponent. He was not one to seek the incremental victories of Frederick the Great. Warfare was an integral part of Napoleon's diplomacy, and the best position from which to negotiate a settlement was with one's boot on the enemy's throat.

Admiral Nelson and the New Naval Warfare

Prior to the Revolutionary War and the Napoleonic Wars, naval warfare in the eighteenth century had in most cases been indecisive, as admirals were wedded to conservative tactics that discounted maneuverability. Instead it favored set-piece battles in which each opposing fleet formed its ships into a single line facing the opponent, and each ship fired on its corresponding number in the enemy line. These tactics were increasingly displaced at the turn of the century by a more fluid and offensive mind-set on the part of the British Royal Navy, a movement that

THE BATTLE OF TRAFALGAR, OCTOBER 21, 1805

The Battle of Trafalgar was the decisive naval battle of the Napoleonic Wars and one of the most important naval battles in history. When French vice admiral Pierre-Charles de Villeneuve's Franco-Spanish fleet of 33 warships sortied from the Spanish port of Cadiz, it was attacked by a British fleet of 27 warships under the command of Admiral Nelson. Nelson's plan was to split his fleet into two columns that would pierce the Franco-Spanish line at two points, thus allowing for each segment of the enemy fleet to be defeated thoroughly. A combination of Franco-Spanish inexperience and

British competence and self-assurance meant that this plan worked to perfection. By the end of the battle the Franco-Spanish fleet had been utterly vanquished, having lost two-thirds of its warships. Although Nelson was fatally wounded by a French sharpshooter at the height of the battle, he lived long enough to hear of the extent of his victory and exclaimed "Thank God I have done my duty." The British victory at the Battle of Trafalgar ended the threat of a French invasion of the British Isles and cemented British naval supremacy for a century.

—Wesley Ferris

was led by Admiral Lord Horatio Nelson (1758–1805). Nelson had a profound impact on naval warfare, not only in the Napoleonic Wars but also in the decades after his death.

He had an aggressive attitude toward naval warfare, emphasizing the advantages of attacking the enemy. Believing in the superiority of British warships and seamen, he argued that no British captain could go wrong by sailing his warship toward the enemy and engaging them. Tactically, Nelson focused on the value of maneuverability. Unlike traditional tactics, he was willing to divide his forces and attempt to bring the preponderance of his firepower against isolated sections of the enemy fleet. An important component of this emphasis on maneuverability was the latitude that Nelson gave his ship captains. Once a general battle plan was sketched, he left it to his captains to maneuver their warships to take advantage of the opportunities that battle presented to them. This trust in his subordinates made Nelson incredibly popular with his captains and seamen, and the Nelson touch, which brought out the best in those who served with him, also contributed to his success.

These new attitudes toward naval warfare were not exclusively pioneered by Nelson, as glimpses of them could be seen at the battles of Camperdown (1797) and St. Vincent (1797). However, Nelson was the most famous and most effective practitioner of them. At the Battle of the Nile (August 1, 1798), he destroyed a

British admiral Horatio Nelson's overwhelming triumph over the combined Franco-Spanish fleet at the Battle of Trafalgar ensured Great Britain's protection from invasion for the remainder of the Napoleonic Wars. (Print after W. L. Wyllie, 1905, from the collection of Philip Haythornthwaite)

French squadron at anchor and ruined Napoleon's scheme to invade Egypt. At the Battle of Copenhagen (1801) Nelson deliberately ignored an order to disengage in order to execute a difficult maneuver that resulted in the destruction of the Danish fleet. His most famous victory was the decisive Battle of Trafalgar (1805), although it also cost him his life. In the years that followed Nelson was lauded in the United Kingdom as one of its greatest heroes. Moreover, naval strategy in the decades to follow revolved around the idea of implementing his strategies.

Nineteenth-Century Military Theory—Clausewitz and de Jomini

In the aftermath of the Napoleonic Wars, military theorists attempted to unlock the secrets of Napoleon's success and to understand the nature of war in light of the changes that those years had wrought. If Napoleon's genius could be understood, it was hoped, it could be emulated, and future generals could achieve the same victories. Explanations for Napoleon's success came to be broadly divided into two groups, whose leading theorists were Antoine-Henri de Jomini (1779–1869) and Karl von Clausewitz (1780–1831).

Jomini, born in Switzerland, served in Napoleon's army as a staff officer under French Marshal Michel Ney from 1802 until 1813, when he defected to the Russian army and was given the rank of lieutenant general prior to the Battle of Leipzig. Jomini's theories on war were distilled in his most famous work, *Précis de l'Art de la Guerre* (*Summary on the Art of War*), published in 1838, although his ideas had changed little from his first writings on military strategy in 1803. He argued that wars could be explained rationally and that they could be understood by a simple formula that he felt was derived from Napoleon's methods of warfare. The key to victory was offensive action to combine superior forces against weaker enemy forces at a decisive point. For Jomini, war was a scientific enterprise best understood on scientific principles. Such a focus excluded social, political, and logistical factors and also ignored the human component of war, such as the potential for human error. For Jomini, war was a limited exercise that would be decided by simple decisive actions in battle. Thus, any country could match Napoleon's success simply by adopting his methods on the battlefield. Jomini's theories had an appeal to the conservative states that reasserted themselves

after 1815, as they were eager to learn the secrets of Napoleon's military success without having to also adopt the social and political changes that the French Revolution had set in motion.

Clausewitz was a Prussian officer who, after a series of Prussian defeats at the hands of Napoleon, was a leading reformer of the Prussian army between 1807 and 1811. When King Frederick William III of Prussia bowed to Napoleon's demands for assistance with his invasion of Russia, Clausewitz and other reformers resigned their commissions to assist the Russians. After aiding the liberation of Prussia, Clausewitz was made the director of the Prussian war academy, a post he held until 1830, a year before his death in 1831. His most famous work, *Vom Kriege* (*On War*), was published posthumously by his widow in 1832.

Clausewitz's theories were in many ways fundamentally opposed to those of Jomini. Whereas Jomini narrowly focused on the battlefield, Clausewitz argued that war could not be separated from social, political, and cultural factors. No longer could war be the exclusive preserve of a narrow band of professionals. The Napoleonic Wars had shown that war would now involve the common people of the country as well through nationalist enthusiasm and mass recruitment. Since war now had a greater capacity for escalation and involved entire populations clashing with each other, it was imperative that political leaders enter into war with specific objectives. War itself was not to be seen as an end but rather as the means to the achievement of political goals. Moreover, in contrast to Jomini's scientific and rational principles, Clausewitz emphasized modern war's chaotic nature. Wars and battles were uncertain and unpredictable and were waged by men who were subject to the full range of human flaws, to say nothing of the fog of war itself. Thus the morale of soldiers and officers was vital in order to push forward to victory despite the human errors and confusion that could occur on the battlefield. According to Clausewitz, although war should only be entered into with specific objectives, once it began it had to be waged thoroughly and ruthlessly. The enemy's armies had to be confronted and destroyed, the enemy's capital occupied, and its government and people brought to their knees.

In essence, modern warfare involved unlimited means to limited ends.

In the first decades after the Napoleonic Wars, Jomini's theories held sway over military strategists, influencing the generalship in such conflicts as the American Civil War. However, the string of Prussian victories in the late 1860s and early 1870s, culminating in the triumph over France in 1870–1871, saw the emergence of Clausewitz. Field Marshal Helmuth von Moltke (1800–1891), the Prussian chief of the General Staff and the architect of Prussia's victories, had been a student of Clausewitz at the Prussian war academy and had adopted Clausewitz's theories in his strategies and in his reorganization of the Prussian army. By training officers to think independently and to act as they felt appropriate to further the overall strategic aim, each element of the army would be able to coordinate actions without explicit direction from the high command. This decentralization of the command structure was a means by which the disorder of the battlefield could be overcome. The other major powers were eager to unlock the key of the Prussian victories and turned to Clausewitz's theories on war. Thus since the 1870s Jomini's theories have been almost entirely forgotten, while Clausewitz has remained at the forefront of thinking on war into the twenty-first century.

Mahan and the Role of Sea Power

Alfred Thayer Mahan (1840–1914) played an important role in the development of naval theory and strategy at the end of the nineteenth century and was also a strong supporter of American imperialism. His belief that naval and commercial power required a powerful navy influenced many leaders in Europe and the United States. Mahan was the son of Dennis Hart Mahan, a West Point instructor responsible for initiating

the study of military theory in the United States. The younger Mahan was appointed to the Naval Academy and graduated second in his class in 1859. During the Civil War he served in the blockade of southern ports. Following the war Mahan continued his naval career, but his real interest was in history and its lessons. In 1883 he published *The Gulf and Inland Waters*, a book about Union naval operations during the Civil War. The book established his academic reputation and earned him an appointment to the Naval War College at Newport, Rhode Island. Mahan gathered his lectures and in 1890 published them as *The Influence of Sea Power upon History, 1660–1783*. The book made a case that commercial and political power rested upon naval power. Only a strong navy, with battle squadrons that could seize control of the seas, would secure a country's future.

The book had little impact at first. Mahan, however, did his best to raise interest in his work. He sent copies to naval and political leaders in the United States and Great Britain, including Senator Henry Cabot Lodge of Massachusetts and Theodore Roosevelt, the future president. When Mahan visited Great Britain, he was celebrated and received honorary degrees from both Cambridge and Oxford. Kaiser Wilhelm of Germany was so impressed that he ordered that a copy of Mahan's book be made available on every ship of the German Navy.

Mahan followed his book with articles calling for an American navy second to none. Improved funding for the Naval War College was one priority. Other priorities included cooperation (although not an alliance) with Great Britain. Mahan directly attacked the isolationist

Alfred Thayer Mahan was an author, naval officer, and educator whose book *The Influence of Seapower upon History*, argued that the nation that controls the oceans maintains its supremacy in times of peace and war. (Library of Congress)

► SEA POWER AND THE U.S. ROLE IN THE WORLD

In the following excerpt from Mahan's most famous book, *The Influence of Sea Power upon History, 1660–1783* (1890), the author draws a link between naval power and colonial possessions.

“Undoubtedly under this second head of warlike preparation must come the maintenance of suitable naval stations, in those distant parts of the world to which the armed shipping must follow the peaceful vessels of commerce. The protection of such stations must depend either upon direct military force, as do Gibraltar and Malta, or upon a surrounding friendly population, such as the American colonists once were to England. . . . Such friendly surroundings and backing, joined to a reasonable military provision, are the best of defenses, and when combined with decided preponderance at sea, make a scattered and extensive empire, like that of England, secure. . . . Colonies attached to the mother-country afford, therefore, the surest means of supporting abroad the sea power of a country.”

attitude prevalent in the United States in his day. He called for the annexation of Hawaii as vital to national security. Bases in the Caribbean and a U.S.-controlled canal through Central America were also important. In his view, additional coaling stations throughout the world would be needed to provide supplies for squadrons protecting merchant ships.

As American commercial interests grew, Mahan believed that it was important to create a modern navy to protect them. Contemporary naval doctrine limited the navy's role in wartime to raiding enemy commerce and defending the American coasts. Instead, Mahan believed that only squadrons of battleships able to assert control over the sea would help the United States assume its rightful place among nations. A concentrated battle fleet would discourage enemy attacks and provide for the national defense.

Mahan served as president of the War College from 1886 to 1893 and commanded the cruiser *Chicago* from 1893 to 1896. He also wrote a number of books, including *The Influence of Sea Power upon the French Revolution and Empire, 1793–1812* (1892) and articles that appeared in influential journals. Mahan criticized the quality of the existing American warships and continued his call for quantitative and qualitative improvements. Many Americans were displeased that a serving naval officer was interjecting himself into politics, but Mahan found many allies and supporters. The most influential was Theodore Roosevelt, who regularly met with Mahan. As assistant secretary of the navy during the Spanish American War, Roosevelt arranged for the American Asiatic Squadron to attack the Philippines, in accord with Mahan's thinking. The peace treaty with Spain reflected the expansionist ideas of Mahan, with new acquisitions—the Philippines, Guam, and Puerto Rico—to serve as naval outposts.

Mahan retired from the navy in 1896 but was recalled to serve on the Naval War Board when the Spanish American War broke out. He was one of five American delegates to the Hague Peace Conference in 1899. In 1906 Mahan was promoted to rear admiral while on the retired list. He served as president of the American Historical Association in 1902 and continued to write about naval matters until his death in 1914.

Military Academies and Military Professionalism in Europe and the United States

National military academies are a relatively recent development in military affairs, most dating from the early decades of the nineteenth century. The traditional method of training young officers was through practical experience in the regiment. It took quite some time for the concept of the military academy to take root. Several nations founded specialist schools for artilleryists or engineers during the eighteenth century but still relied on the older regimental systems for the training of most of the officer corps. Even after the introduction of general academies, most officers were commissioned through alternative methods. The early academies did not enjoy the elite status that most enjoy today.

The primary method of training officers before the rise of service academies was learning by doing. A young man was commissioned, primarily based on social acceptability, directly into his regiment. There the new officer learned drill, discipline, tactics, and the fundamental customs of the officer corps. All later learning was through pure experience, although more ambitious officers supplemented experience with study.

The development of formal military academies was a lengthy affair. John of Nassau, cousin to the more famous Maurice, opened a military academy at Siegen in 1619. This was not so much a national academy but instead was a for-profit operation, training officers from a variety of nations. Frederick William I of Prussia created a cadet school in Berlin in 1717 that provided about one-third of the officer corps, with the rest rising through the traditional regimental system. Russia opened a military academy in 1731. The British joined the trend in 1741 with the establishment of the Royal Military Academy at Woolwich to train artillery and engineering officers. The Austrian Theresian Military Academy inducted its first class in 1751, unique in that it admitted 100 noble and 100 common officer candidates. France also inaugurated an academy system in 1751.

These eighteenth-century academies were limited in scope. Most were dedicated to specialist skills like artillery and engineering and sought to inculcate and reinforce the culture of

the nobility. They were merely an alternative—and not necessarily an elite one—to the existing regimental system.

The military schools of the nineteenth century initially followed the same model. Britain established the Royal Military College in 1800 to train staff officers in response to reverses suffered in the early years of war with Revolutionary France. The initial role of the college was expanded in 1802 to include a Junior Department to train cadets as line officers. The college moved to a new location at Sandhurst in 1812. The cadets paid tuition, boarding, and uniform fees, as at a civilian public school, and were not subject to military discipline. The college developed a reputation for disorderly behavior, rioting, and bullying similar to the public schools of the era as well. Cadets received only rudimentary instruction in practical military skills, often outdated and usually useless in the field. Simultaneously, the traditional purchase system, which required no formal military training, remained the primary avenue of commission: between 1834 and 1838 only 86 of the 397 commissions given in the line infantry went to graduates of Sandhurst. Only after the abolition of the purchase system in 1870 did Sandhurst become the normal route to a commission.

The United States Military Academy (USMA) was also founded in 1802 and likewise had a low reputation during its first 15 years of operation.

> NAPOLEON ON MILITARY EDUCATION

Napoleon was a great believer in a formal military education and, unlike most of his contemporaries, believed that it went beyond the mechanics of laying guns or building fortifications. Whereas most nations were content to focus on the technical skills in their service schools, Napoleon stated: “Tactics, the evolutions, the science of the engineer and of the artilleryist can be learned in treatises, much like geometry, but the higher art of war is acquired only through the study of history of the wars and battles of the Great Captains, and from experience.” The formal study of military history thus became a central theme in the service academies of the empire.

—Melvin Smith

President Thomas Jefferson pushed for the creation of an academy to train American officers in artillery and engineering. The first two superintendents, hampered by both engineering duties that constantly called them away from USMA and a sense of privilege that often put them at odds with national authority, failed to instill a sense of duty and professionalism into the corps of cadets. Not until the tenure of Sylvanus Thayer (1817–1833) did the academy develop a sound and broad curriculum of military and civil engineering, leadership, and liberal arts. He also laid the groundwork for the key academy values of “Duty, Honor and Country” that became the official motto of the institution in 1898. Unlike its European counterparts, the USMA provided the vast majority of American officers in the nineteenth century and was for a number of years the only engineering school in the nation.

Triple Alliance

The Triple Alliance was a secret treaty of mutual assistance between Germany, Austria-Hungary, and Italy in effect from 1882 to 1915 and a diplomatic manifestation of the dissatisfaction felt by Italian imperialists. In May 1882, Italy, angered by the establishment of the French protectorate in Tunisia (1881), joined the Austro-German Dual Alliance. According to the treaty, the three powers were to support each other if the French should attack. Additionally, Germany and Austria-Hungary promised to help Italy acquire Tunisia (from the French) and Tripoli (from the disintegrating Ottoman empire).

The coordination of the Austria-Hungarian and Italian policies in the Balkans within the

framework of the Triple Alliance was instrumental in establishing and maintaining the de facto Austrian protectorates in Serbia (1881–1895) and Romania (1883–1916). After 1895, the three powers successfully concerted their opposition to the Japanese expansion and coordinated their policies in China. Nevertheless, the immediate Italian territorial ambitions in the Mediterranean and the Balkans remained unfulfilled. Additionally, Germany from 1899 to 1902 clearly shifted the focus of its alliance policy while trying to create a bloc with Russia and France and set the limits to British overseas expansion.

Dissatisfied, Italy turned to Paris and recognized, in 1900, the French protectorate in Tunisia and claims in Morocco in exchange for being given a free hand in Tripoli and Cyrenaica. At the beginning of World War I, Italy refused to support Germany and Austria-Hungary, stressing that France was not the aggressor. In 1915, Italy's entry into the war on the side of the Triple Entente (an alliance between Great Britain, France, and Russia that commenced in 1907) formally liquidated the Triple Alliance.

Triple Entente

The Triple Entente was an international collaboration among Great Britain, France, and Russia from 1907 to 1917 that developed from the settlement of their long-standing and intense colonial conflicts and differences. The earlier Anglo-French Entente, out of which the Triple Entente grew, was based on several conventions concluded on April 8, 1904. These agreements provided that France would recognize the priority of the British in Egypt in return for its own predominance in Morocco. France and England

agreed that no fortification in Morocco should be erected that would menace Gibraltar and that the Spanish claims in northern Morocco should be recognized. France surrendered its ancient exclusive fishery rights on the shores of Newfoundland in return for British territorial concessions on the borders between Gambia, Nigeria, and the French possessions in Africa. Additionally, Britain and France settled their disputes over spheres of influence in Siam, the customs regime in Madagascar, and control over the New Hebrides.

Another core treaty that led to the Triple Entente was the Anglo-Russian Entente, which was based on a bilateral convention concluded on August 31, 1907. The agreement sought to prevent the German penetration in the Middle East and envisaged the division of Persia into spheres of influence: Russian (northern), British (south-western), and a neutral zone between them. Additionally, Russia acknowledged Afghanistan and Tibet as being in the British sphere of influence.

Although the earlier Franco-Russian defense alliance of 1894 dealt primarily with the European strategic situation, the two powers successfully coordinated their attitudes and policies in the Middle East and China as well. Additionally, the Anglo-Russian and Anglo-French agreements had a broader international impact.

The Anglo-Russian Entente was instrumental in the Russo-Japanese rapprochement over their imperial interests in the Far East (in 1911). The Moroccan crisis of 1906 stimulated the development of military cooperation within the Anglo-French Entente.

During World War I, the Triple Entente finally developed into a multilateral military and political alliance. In 1915 and 1916 Britain, France, Russia, and Italy reached an agreement about the future partition of the Ottoman Empire. The entente powers also pledged to compensate Italy in case the German colonial empire was partitioned, but the entente powers did not fulfill this promise. After their victory, England and France managed to obtain control over German and Ottoman possessions through the League of Nations mandate system, but the revitalized controversies over colonial issues contributed to the final breakup of the entente in the 1920s.

■ Introduction: War and Warfare in Europe

By 1900, European states supported the largest, best-equipped, and most widely imitated armies and navies in the world. It is surprising therefore to find that the number of wars fought in Europe between 1750 and 1914 was comparatively small in comparison to the frequency of wars in other parts of the world and in previous periods of European history. Only the Seven Years' War (1756-1763) and the wars during the French Revolution and the Napoleonic era were general wars in which coalitions of European states fought one another. In the case of the Seven Years' War, only the fighting between Prussia and its two major oppo-

nents, Austria and Russia, took place in Europe itself. Great Britain, the ally of Prussia, and France, the ally of Austria, fought one another mainly on the seas and in India and North America.

After Napoleon's defeat at Waterloo in 1815, Europe was free of warfare until midcentury, when a coalition of Great Britain, France, and Ottoman Turkey fought against Russia in the Crimean War (1853-1856), which took place on the northeast coast of the Black Sea, far from Europe's major population centers. Between 1859 and 1871 four wars were fought in connection with the unification of Italy and Germany.

In 1859 France and its Italian ally Piedmont defeated Austria in a war that resulted in all of Italy coming under the control of Piedmont except the Papal States and Venetia. Between 1864 and 1871 Prussia fought three successful wars against Denmark, Austria, and France, the last of which, the Franco-Prussian War (1870–1871), led directly to the unification of Germany and the elevation of Prussian king Wilhelm I of the House of Hohenzollern to the position of German emperor. Prussia's wars also helped nationalists bring about the final unification of Italy. In the Austro-Prussian War of 1866, Italy allied with Germany and took Venetia; during the Franco-Prussian War, Italy gained control of the Papal States, while France, the papacy's protector, was focused on fighting the Germans. Europe had no further wars until 1914.

Although European armies and navies in the nineteenth century fought relatively few wars on European soil, they were busy in other ways and in other parts of the world. Troops were used to suppress domestic resurrections and revolutions in several parts of Europe in 1830 and 1848, in France in 1871, and in Russia in 1905. Armies and navies also played a key role in Europe's imperialist expansion in Africa and Asia. Russia fought successful wars against Persia, the Ottoman empire, and the khanates and emirates of central Asia but lost to Japan in 1905, when the two states went to war over conflicting claims in Korea and Manchuria. France went to war in Algeria, Morocco, sub-Saharan Africa, Vietnam, and China. Great Britain, with the largest empire, also was involved in the greatest number of imperialist wars, more than 50 between 1815 and 1914.

European armies and navies and their supporters were victorious in fighting another type of campaign, one that was political rather than military. This victory resulted in an unprecedented increase in military spending, especially between 1870 and 1914. The combined military expenditures of the six major powers (Britain, France, Russia, Italy, Austria-Hungary, and Germany) were four times higher in 1914 than they had been 44 years earlier. Such commitments were both a symptom and a cause of the antagonism and insecurities that characterized

European diplomacy in an age of imperialist rivalries, economic competition, and nationalist fervor.

—James H. Overfield

Seven Years' War, 1756–1763

The Seven Years' War was the third war between Austria and a rising Prussia for control over Silesia, the culmination of the long Anglo-French struggle for colonial supremacy, and the last major conflict before the French Revolution to involve all the traditional great powers of Europe. There were three principal theaters of this war. Great Britain helped support Frederick of Prussia in battling Austria, France, and Russia and their allies: British finances helped purchase mercenary troops to augment Prussia's army. The British navy battled the French navy in the Atlantic and Indian Oceans as well as the Mediterranean and Caribbean Seas. Finally, augmented by colonial militia, the British made a determined and ultimately successful effort to destroy French power in North America. When the Seven Years' War ended, Frederick gained Silesia, though with significant manpower losses; the British gained territory in India and all of French Canada (save for tiny St. Pierre and Miquelon Islands off the Newfoundland coast).

When hostilities erupted in North America after British general Edward Braddock's disastrous effort in 1755 to take Fort Duquesne, British king George II sought a treaty with Frederick II of Prussia to guarantee the state of Hanover, where George's family had ruled before moving to England. This friendship eventually led Austria to ally with France and Russia (and Saxony and Sweden and very much later Spain) against Prussia, England, and later Portugal.

Two years later, the European fighting, mostly to the east and south of the Kingdom of Prussia, began. When Czarina Elizabeth joined the Austrian-French alliance, Frederick, who understood the advantages of interior lines, believed strongly in the initiative, and was an aggressive, tactically oriented commander, attacked Saxony to take that kingdom out of the opposing alliance. In spring 1757, he invaded Bohemia and defeated the Austrians at Prague.

Then he laid siege to Kolin and, dividing his forces to retain the siege and meet a large relief army, lost one-third of them in the resulting five-hour battle against Austrian count Leopold von Daun in June. Thereafter, Frederick retreated.

At this point, Frederick demonstrated his understanding of interior lines and of the proper use of audacity. He faced the French advancing onto Hanover, which he was pledged to defend, the Swedes on his north, the Russians to his east, and the Austrians from the southeast. He fought a larger French-led army at Rossbach in the state of Thuringia and won a two-hour battle, and a month later, in early December, he defeated the Austrians in Silesia near the town of Leuthen.

The victory at Leuthen was remarkable. Frederick hurried 170 miles in 12 days to take command of a defeated Prussian army and expel the Austrians, who occupied a sound defensive position about 5 miles long on a north-south axis. Frederick's forces approached, and then, as several oblique hills hid his advance, he moved the bulk of his smaller army—infantry and cavalry—to his right. When he attacked, his force greatly surprised and eventually overwhelmed the Austrian left. Despite the efforts of Austrian prince Charles to reestablish his line on an east-west axis, when nightfall came, the Austrians had fled the field, having suffered major casualties heading into winter quarters.

This victory may well have marked the high tide for Prussia during the conflict. Although Prussian forces initially defeated the Russians in a costly battle at Zorndorf in the summer of 1758, Frederick was defeated by a combined Austrian-Russian army at Kunersdorf in the summer of 1759, losing some 18,000 men in six hours of battle. Frederick crossed the Oder River near Frankfurt and attacked the larger allied army, seeking to envelop its flanks, but his forces became disorganized, attacked in piecemeal fashion, and suffered grievously. Later, Prussia lost a detachment at Maxen before going into winter quarters.

In 1760, the main fighting occurred in Silesia, although there were battles elsewhere. In the fall of 1760, the Russians seized Berlin, the Prussian capital, although Frederick soon defeated von Daun at Torgau. It was a bloody and

costly victory, however, where Frederick lost one-third of his attacking force.

In 1761, William Pitt stepped down as British prime minister, and his policy of subsidizing Frederick's European land campaigns to free British power to seize France's overseas empire ended. This development led more to campaigns of maneuver and countermaneuver in Europe. Still, before the weight of the Austrian-based alliance could overwhelm Prussia, Elizabeth of Russia died and was succeeded by Peter III, who greatly admired Frederick, agreed to an easy peace, helped arrange peace between Prussia and Sweden, and helped Frederick push Austrian forces out of Silesia. In the ensuing peace treaties, Austria lost Silesia to Prussia; otherwise, territorial borders remained mostly unchanged.

The conflict between Great Britain and France was more decisive. Called the French and Indian War in North America, it was the last of four great colonial conflicts on that continent and across the globe, and it resulted in a great British victory. Prime Minister William Pitt planned financially to support Prussia to contain the French on the European continent while he concentrated British power on conquering French colonial possessions. Despite some fits and starts and perhaps less than ideal cooperation by American colonial governments and militia, the British ultimately triumphed over the French in North America while defeating the French in India and thus paving the way for the vast British empire on the subcontinent.

Pitt put the wealth of Britain into the war effort. He sent large armies transported by huge navies to the New World; he purchased supplies from colonial purveyors; and he engaged colonial militia and rangers. And he kept his focus on the objective—winning Quebec. Similarly, he sought to defeat the French fleet and to take French possessions on the Indian subcontinent.

By 1758, the weight of British (and colonial) power began to be felt in the conflict. Pitt brought focus and determination to the conflict. The British under General John Forbes again attacked Fort Duquesne, this time advancing from western Pennsylvania in the fall. The attack succeeded, the French retreated, and the British cut off Quebec from French Louisiana. Also, that

year, another offensive commanded by General Jeffrey Amherst sailed from Halifax, Nova Scotia, to attack Louisbourg, a French fort on Cape Breton Island, guarding the entrance to the Gulf of St. Lawrence and the St. Lawrence River, the route connecting Quebec and France. Amherst landed west of Louisbourg and brought up siege weapons, and the fort surrendered. However, an attack against Fort Ticonderoga on Lake George did not fare as well, and the British rather unexpectedly retreated when the French commander expected a continuation the next day and he in turn contemplated retreat.

The victories of 1758 were completed by greater victories in 1759. General Amherst gained control over Ticonderoga, which the French had mined and exploded before abandoning. Meanwhile, General James Wolfe sailed to Quebec, approached the city from the western side, engaged in a battle on the Plains of Abraham against the French commander, Louis-Joseph de Montcalm-Gozon, the Marquis de Montcalm de Saint-Véran, and the British compelled the surrender of the citadel. Both opposing commanders died in this pivotal battle.

In 1760, Amherst compelled the surrender of Montreal, and the French had lost their colony in Quebec. The war would drag on for another several years as the conflict expanded to include the Spanish and Cuban and Gibraltar areas of operation.

Meanwhile, the British defeated the French in India. After the British won at Wandiwash in early 1760, they pushed the French back upon their main base at Pondicherry in southern India. British control of the seas guaranteed the attackers adequate supplies, while the French defenders weakened. Finally, some months later, the British began a siege bombardment in January 1761, and the French garrison surrendered five days later. Thereafter, the British East India Company, through diplomacy, trade, bribery, and force, managed to expand British power along the coast from the Tamils in the south to north of Madras to the east and north. Thereafter, the British engaged in four so-called Mysore Wars against local rulers to solidify their growing empire that developed from the fighting of the Seven Years' War. In the end, this world war of a sort led to Britain gaining French Canada,

Minorca, and Florida; France ceding Louisiana to Spain; and Prussia keeping Silesia.

French Revolutionary Wars, 1792–1802

From the outset, the French Revolution aroused the hostility of European royalty, who feared that revolutionary ideas could spread beyond France to stir up upheavals in their own countries. Likewise, French émigré nobles added fuel to the war fervor by urging European rulers to intervene and suppress the revolution. Friction with Austria intensified when King Louis XVI and Queen Marie Antoinette tried in vain to flee abroad in June 1791 and join the revolution's enemies. Finally, the Pillnitz Declaration issued by the Austrian and Prussian rulers on August 27, 1791, made it clear they would intervene and restore royal power if other European powers would join them. The French interpreted the declaration as an act of interference in their internal affairs, and it was the French who first declared war. When Austria and Prussia concluded a military convention in February 1792, the Legislative Assembly declared war on Austria on April 20, 1792.

At the beginning, French troops suffered a series of setbacks. Although the army had numbers and enthusiasm, it lacked discipline and experienced officers. An attempt to invade Belgium ended in disaster. Meanwhile, Austro-Prussian forces under the Duke of Brunswick advanced toward Paris. On July 25, 1792, the duke issued the famous Brunswick Manifesto, threatening to raze the capital if the royal family was harmed. The Legislative Assembly proclaimed France in danger, and revolutionaries accused King Louis

of conspiring with the Austrians. Tension grew when a Parisian crowd stormed the Tuileries palace on August 10, 1792, and arrested and imprisoned the royal family. In September the new legislature, the National Convention, abolished the monarchy and proclaimed a republic. The Girondins, a moderate republican group, and the Jacobins, a radical revolutionary faction, dominated the Convention, which had the immediate task of continuing a war that was going badly. Verdun surrendered on September 2, 1792; Lafayette with his troops had already deserted to the Austrians.

The Convention decreed the enlistment of new volunteers, reorganized and equipped the army, and placed it under the command of Generals Charles Dumouriez (1739–1823) and François Kellermann (1735–1820). The republican army won its first victory over the Duke of Brunswick at Valmy on September 20, 1792. The engagement, not important militarily, was nevertheless a victory of the revolutionary army and a turning point in the war. In late 1792 the French continued the offensive. The Prussians evacuated Verdun, and General Adam Custine (1740–1793) occupied Mainz and Frankfurt. Dumouriez defeated the Austrians at Jemappes, took Brussels, and occupied the Austrian Netherlands, roughly present-day Belgium. French troops entered Savoy and Nice, and their patriots requested annexation to France.

Meanwhile, the execution of King Louis in January 1793 and the annexation of Belgium and most of the Rhineland forced Britain to form the First Coalition, consisting of Russia, Austria, Prussia, Spain, Holland, and Sardinia. In response, the Convention boldly declared war on Britain, Holland, and Spain in February 1793. The Austrians pushed the French out of Belgium and at the Battle of Neerwinden defeated General Dumouriez, who soon abandoned his troops and also defected to the Austrians. In southeastern France, the British besieged and captured the port of Toulon. The troops of the republic had once again been pushed back on all fronts.

In Paris, the Jacobins took control of the government on June 2, 1793. Facing a dangerous war situation and widespread antigovernment outbreaks throughout the country, the Jacobins set up the Committee of Public Safety and instituted the Reign of Terror to win the war and

suppress the revolts of the Girondins, royalists, and Catholic clergy. On August 23, 1793, the Convention declared universal conscription of all single men ages 18 to 25 to defend France. The revolutionary army employed new tactics emphasizing the use of artillery and rapid mobility of the cavalry. Promotion was based on merit. In December 1793 the republican army took the offensive against the Coalition armies, forcing them to retreat across the Rhine, while the young Colonel Napoleon Bonaparte helped wrest the city of Toulon from the British.

In Paris, leadership passed to revolutionary idealist Maximilien Robespierre, who would dominate the Convention until July 1794. Robespierre dreamed of establishing a Republic of Virtue through the Reign of Terror. He cracked down on the Hebertists, who wanted to carry the economic revolution further, and guillotined the Dantonists, who called for an end to the Terror. After General Jean Jourdan's victory at Fleurus against the First Coalition armies in June 1794, the initiative on the Continent favored France, and terror seemed increasingly unnecessary. Reacting to the excesses of Terror, moderates in the Convention and Robespierre's opponents in the Committee of Public Safety brought him down in July 1794 and beheaded him. Political changes followed. The rule of the Thermidorians, lasting from July 1794 to the autumn of 1795, brought the dismantling of the apparatus of Terror and the closing of the Jacobin clubs. In 1795 the Thermidorians drafted a new constitution and set up the Directory (1795–1799), a political body of five directors jointly responsible for conducting France's domestic and foreign affairs.

In the war against the European Coalition, the army of the Directory drove the Austrians out of Belgium and occupied Holland in December 1794. Prussia, financially exhausted, withdrew from the war and concluded the Treaty of Basel in March 1795. Soon Spain and Holland made peace. The Polish revolt forced Russia to leave the Coalition. Only Britain and Austria remained at war with France. The war against Austria continued during 1796–1797. Jourdan invaded southern Germany, while Napoleon attacked the Austrians in Italy. Although the German campaign ended in failure, in the Italian

campaign Napoleon defeated the Austrians at the battles of Millesino, Lodi, Castiglioni, Roveto, Bassano, and Arcola in 1796. He struck at the Sardinian army at Mondovi, knocked it out of the war, and occupied the fortresses of Mantua and Milan in January 1797. He advanced toward Rome, but the pope hastily signed the Treaty of Tolentino. In April 1797 Napoleon crossed the Alps and forced the Austrians to conclude an armistice. Six months later they signed the Treaty of Campo Formio, by which they ceded Belgium and the Rhineland to France but retained Venice, Istria, and Dalmatia. The Italian campaign effectively ended the First Coalition, and Britain alone remained at war with France.

Napoleon now decided to strike at Britain. He organized the Egyptian expedition, ultimately hoping to deprive the British of India, a most unlikely prospect in view of British sea power. In May 1798 he sailed for Egypt with 350 ships, more than 30,000 troops, and a corps of scientists. He defeated the Mamluk cavalry at the Battle of the Pyramids near Cairo in July. Admiral Horatio Nelson (1758–1805), however, destroyed Napoleon's fleet at the Battle of the Nile, cutting him off from Europe. In early 1799 Napoleon set out to take Palestine and Syria but failed. He returned to Egypt in May and smashed an Ottoman force at the Battle of Abukir. This victory left him free to consider his return to France. In August he sailed from Egypt, leaving General Kléber in command of the French army.

In Europe, Britain formed the Second Coalition (December 1798), which included Austria, Russia, Naples, Portugal, and the Ottoman empire. In 1799 coalition armies defeated the French at the Battle of Magnano, while at the Battle of Cassano the Austrian general Melas and the Russian army under Marshal A. Suvorov (1729–1800) won a major victory. Suvorov overcame another French army at the Battle of Tiberia in June, while at the Battle of Novi he and Melas routed the French. Only General André Masséna was successful over the Russians, driving them out of Zurich, while General Guillaume Brune defeated an Anglo-Russian force in Holland. But soon the Second Coalition began to fall apart. In October 1799 Russia withdrew and made peace with France when Tsar Paul I changed sides and revived the Armed Neutrality against Britain.

Back from Egypt, Napoleon staged a coup d'état on November 9, 1799; set up the Consulate; and proclaimed himself first consul. After the allies rejected his peace offering, in early 1800 Napoleon renewed his campaign in northern Italy against the Austrians. Marching through the most difficult snow-covered terrain, he crossed the St. Bernard Pass, attacked the Austrians, and took Milan. On June 14 he fought an obstinate battle against the troops of General Melas at Marengo, turning a likely French disaster into an Austrian rout. The Austrians then asked for an armistice, but only after a French victory at Hohenlinden (December 1800) and a French invasion of Austria (January 1801) did the emperor negotiate the Treaty of Lunéville on February 9, 1801. By its terms, France annexed Belgium and southwestern Germany, while Austria recognized the Helvetian (Swiss), Batavian (Dutch), Ligurian (Genoese), and Cisalpine (Lombardy) republics, which became French dependencies.

Britain still remained at war with France until 1802. But both countries were now eager for a breathing spell. On March 27, 1802, they negotiated the Treaty of Amiens, which ended Anglo-French hostilities. For the first time in ten years, Europe was at peace. Yet the peace of Amiens proved to be a brief truce. A year later a second round of wars, the Napoleonic Wars, would begin.

Napoleonic Wars, 1803–1815

The Napoleonic Wars were a continuation of the French Revolutionary Wars that began in 1792 and ended with the conclusion of the Anglo-French Treaty of Amiens in 1802. But the peace of Amiens turned out to be temporary. Soon territorial disputes between France and Britain brought them into a new confrontation, and

Napoleon encamped an army around the port of Boulogne on the English Channel in anticipation of an invasion of Britain. In response, the British declared war on France on May 26, 1803, and set about organizing a new alliance, the Third Coalition, that included Austria, Russia, and Sweden.

Napoleon hastily removed his troops from the English Channel and sent them to the Rhine and northern Italy. Having assumed command of the armies in Germany, he routed the Austrians at the Battle of Ulm (October 1805) and took 30,000 Austrians prisoner. Almost simultaneously, the British Royal Navy under Admiral Horatio Nelson destroyed the French fleet at Trafalgar on October 21, thus breaking France's naval power and confirming Britain as the mistress of the seas.

While Britain dominated the seas, Napoleon continued the conquest of central Europe. He occupied Vienna, while Russian armies under General Kutuzov and Tsar Alexander arrived at Olmütz, a city in Moravia, to join the Austrians in an attempt to stop the French advance. On November 29, 1805, Napoleon's army took position at Austerlitz, where his army of 73,000 men faced a combined Austro-Russian army numbering 86,000. On December 2 in what is sometimes called his masterpiece, he defeated the Austro-Russian armies, and in the wake of the defeat Emperor Francis II of Austria accepted the humiliating Treaty of Pressburg, ceding territories to France's German allies and Napoleon's Italian kingdom. Napoleon's brother Joseph became king of Naples, while another brother, Louis, was proclaimed king of Holland. Napoleon also dissolved the Holy Roman Empire in August 1806, replacing it with the Confederation of the Rhine, consisting of 16 German states with himself as its protector. He also ordered Francis II to abandon his imperial crown of Holy Roman Emperor for the more restricted title of Francis I, emperor of Austria.

Napoleon still faced Britain and Russia, however, and soon had a new enemy in Prussia, whose leaders felt threatened by the creation of the Confederation of the Rhine and the presence of French troops throughout Germany. The Prussians on October 1, 1806, delivered an ultimatum to Paris demanding the withdrawal of French troops to the west of the Rhine and simultaneously invaded Saxony. In response,

Napoleon launched his own lightning campaign and routed the Prussians in two simultaneous battles at Jena and Auerstädt in October 1806.

Napoleon next turned against Britain and tried to destroy the "nation of shopkeepers" (his term) by imposing an economic blockade known as the continental system. His Berlin Decree (November 1806) banned trade and the importation of British goods into continental Europe. Russia, however, continued to pose a threat to Napoleon's grandiose designs even after the disaster at Austerlitz. After fighting an indecisive battle against the Russians on the ice and snow at Preussisch-Eylau in February 1807, he routed the Russians at the Battle of Friedland in June. Alexander concluded an armistice, and in early July 1807 the two emperors and King Frederick William of Prussia met on a raft on the Nieman River and concluded the Treaties of Tilsit, by which Alexander and Napoleon agreed to divide Europe between them: Russia recognized Napoleon's dominance in western and central Europe, and France supported Russia's claims in eastern Europe and Ottoman territories. Alexander also agreed to join Napoleon's economic blockade.

Napoleon had reached the zenith of his power by 1808. He created new republics, deposed dynasties, established the French empire, set up dependencies ruled through relatives or close friends, and ruled 70 million people. Russia maintained friendly relations with him. Only Britain, Sweden, and the Ottoman territories in the Balkans remained outside French influence. But soon his power began to fade, as the rise of nationalism among the defeated nations and Britain's persistent opposition turned the tide against him.

Nationalism was most evident in Portugal and Spain, which Napoleon invaded after Portugal defied Napoleon's ban and opened trade with Britain. Although he was successful at first, a Spanish guerrilla war, which the British financed, tied down 200,000 French troops. After several years of hard fighting, Napoleon's brother Joseph, who had been installed as king after Ferdinand VII had been deposed, relinquished the throne and fled Madrid in 1812. The Peninsular War was Napoleon's first major defeat.

In 1809 Austria announced, rather prematurely, a "war of liberation" of the German

EUROPE IN 1810

people and sent an army of 170,000 into Germany. Napoleon left Spain and again took command of the French army against the Austrians. He defeated them at the Battle of Wagram (July 5–6) and compelled them to sign the Treaty of Schönbrunn, depriving them of considerable territory and population.

Relations between France and Russia also began to deteriorate. After Alexander lifted the economic blockade and opened Russian ports to British trade, Napoleon, furious, embarked on his invasion of Russia. On June 24, 1812, he crossed the Nieman River with his multinational Grand Army of 500,000 men. The army advanced rapidly, but the Russians evaded a pitched battle and allowed the French to press on through burning villages, towns, and cities. On September 7 Napoleon engaged the Russians at Borodino, where despite repeated French attacks the Russian defense held. Finally the two

armies retired toward the evening to their earlier positions after between 75,000 and 90,000 troops had been killed or wounded.

The next day, preferring the loss of Moscow to the loss of his army, the Russian general Mikhail Kutuzov decided to withdraw his troops beyond Moscow, allowing the French to enter the city. On September 14 the last Russian detachment left Moscow, and virtually the entire population followed. Napoleon's vanguard entered a deserted city where mysterious fires broke out, burning it to the ground and devouring supplies and everything upon which the enemy had depended for shelter and subsistence.

Napoleon offered Alexander a truce but, after waiting five weeks without an answer, ordered what proved to be a catastrophic retreat as swarms of soldiers and peasants harassed and attacked his army, committing horrific atrocities upon the starving, freezing, and dying soldiers.

The Russian army made surprise attacks on the French at the battles of Tarutino, Maloyaroslavets, and Vyazma. At the crossing of the Berezina River, the Russians caused thousands of French soldiers to drown or freeze to death. Napoleon, seeing the destruction of his Grand Army, abandoned it on December 5, 1812, and returned to Paris to raise another army.

Early in 1813, Napoleon returned to meet the Russians in Germany. This time, however, he confronted not only the Russians but also a new European coalition as well, the Sixth, that began with the Russo-Prussian alliance to wage the “war of liberation” in Germany. In a series of battles during the spring of 1813, Napoleon defeated the Prussians and Russians at Lützen and Bautzen, and even after Austria joined the coalition, Napoleon again overwhelmed the allied armies at the Battle of Dresden, his last major victory. At the Battle of Leipzig (October 16–19), however, the allies destroyed Napoleon’s forces, and once more Napoleon was forced to retreat. Five months later, on March 31, 1814, Tsar Alexander entered Paris at the head of the allied armies and dictated the terms of surrender. Napoleon abdicated, and Louis XVIII became king of France.

Napoleon’s captors exiled him to the island of Elba, assigning it to him as a sovereign principality and allowing him to retain the title of emperor. The French treasury provided him with an annual income of 2 million francs. In February 1815, however, Napoleon escaped from Elba aboard a small ship and landed in southern France. Received enthusiastically by the French people, he entered Paris on March 20 and began his ephemeral Hundred Days rule. The alarmed allies, meeting at the Congress of Vienna, raised an army under Arthur Wellesley, Duke of Wellington. Napoleon also gathered an army, marched to the north, and repelled the Prussian attack under General Gebhard Blücher at Ligny. On June 18 the Battle of Waterloo ensued. At one point in the battle it seemed that the French would carry the day, but when Blücher returned and joined Wellington with reinforcements, the French army disintegrated. The Napoleonic Wars had finally ended.

Napoleon was exiled to the distant volcanic island of St. Helena, off the west coast of Africa,

where he arrived on October 15, 1815. Here he remained until his death on May 5, 1821.

The Crimean War

Waged between 1853 and 1856, the Crimean War pitted imperial Russia against the allied forces of the Ottoman empire, Great Britain, France, and Piedmont-Sardinia. The first European war since Napoleon’s defeat in 1815, the Crimean War resulted from failed diplomacy over European powers’ rival interests in the Middle East. Remembered as a useless and bloody war, the Crimean War has been described as the first modern war due to technological innovations, including ironclad warships, tactical use of the electric telegraph, the railroad, the minié ball, and trench warfare. It also was the first war that was photographed and was covered by war correspondents “in the field.” Primarily fought on the Black Sea’s Crimean Peninsula, the war ended in a decisive and humiliating defeat for Russia.

By the mid-nineteenth century, Britain’s and Russia’s competing visions for the European balance of power and dominance in the eastern Mediterranean focused on the Ottoman empire and led to an international conference in London, where the Straits Convention was signed in 1841. The convention forbade the passage of foreign warships through either the Dardanelles or the Bosphorus as long as the Ottoman empire was at peace. Although the agreement effectively

> FLORENCE NIGHTINGALE

Credited as the founder of modern nursing, Florence Nightingale (1820–1910) symbolized patriotic duty in Great Britain during the Crimean War. When the British public learned at the war's outset that sick and wounded soldiers were not properly cared for, Nightingale organized a group of nurses who, under her command, battled the filth, pestilence, disorder, and overcrowded conditions found at the British military hospital in Scutari. Popularly known as “the lady with the lamp” for her hospital rounds by lamplight, Nightingale championed the ordinary soldier, leading a national campaign for the improvement of soldiers' health and living conditions that continued after war's end.

—Brigid O’Keeffe

Known the world over as the “The Lady with the Lamp,” Florence Nightingale rose to fame during the Crimean War for introducing the first female nurses to military medical facilities. (Library of Congress)

blocked Russia's access to the Mediterranean, it protected Russia's position in the Black Sea unless it was itself at war with Turkey.

In 1844 Russian tsar Nicholas I met with the British foreign secretary, Lord Aberdeen, to discuss the Ottoman empire's future. Already convinced of the Ottoman empire's imminent dissolution, Nicholas I departed, confident that Russia and Britain would cooperate in overseeing the partitioning of Ottoman lands in the event of the empire's demise. Britain, however, remained committed to upholding the territorial integrity of the Ottoman empire and to blocking Russia's imperial ambitions in the Mediterranean.

In 1853 an ongoing dispute between Catholic and Orthodox Christians over guardianship of the Palestinian holy places provoked renewed conflict between the Ottoman and Russian

empires. When the Ottoman government bowed to the pressure of French emperor Napoleon III and sided with Catholics in Jerusalem, Nicholas I defended the interests of Orthodox Christians. He demanded that the Ottoman government uphold Orthodox interests in settling the Holy Land dispute and recognize Russia as the protector of the Ottoman empire's Orthodox Christian subjects. When the Ottomans refused, Nicholas I ordered Russian forces to occupy the Ottoman-controlled Danubian Principalities in May 1853. Britain and France, both opposed to Russian expansion in the eastern Mediterranean, dispatched naval forces to Besik Bay, just to the south of the Dardanelles, on Turkey's northwest coast.

After a series of failed diplomatic efforts, fighting erupted between Russian and Ottoman forces in October 1853. Russia enjoyed an

initial victory in sinking the Ottoman naval fleet off Sinope, in the Black Sea, in November, but the British decried the battle as a massacre. In March 1854 Britain and France, later joined by Piedmont-Sardinia in 1855, allied with the Ottomans and declared war on Russia. Austria claimed neutrality and forced Russia to withdraw from the Danubian principalities. The allies confronted Russia along the Russo-Turkish border in the Caucasus and in a series of naval attacks on the Black, Azov, Baltic, Bering, and White seas but ultimately decided to center their offensive on Russia's naval base at Sevastopol in the Crimea. The Siege of Sevastopol began on October 17, 1854. Meanwhile, following the Anglo-French victory at Alma (September 20, 1854), the Russians claimed victory at the Battle of Balaklava (October 25, 1854) in which British troops charged down a narrow valley that was flanked by Russian guns on both sides. Of the close to 700 British troops who attacked, 110 were killed, 129 were wounded, and another 32 were wounded and taken prisoner, all in a battle that lasted only 20 minutes. The name of the British unit was the Light Brigade, inspiring the famous Tennyson poem "The Charge of the Light Brigade."

Sevastopol fell to the allies on September 9, 1855, and by early 1856 the combatants were ready to negotiate peace. The war had claimed an estimated 256,000 Russian and 252,000 allied lives, with a high proportion of deaths resulting from disease rather than military action. Meanwhile, the reform-minded tsar Alexander II had succeeded Nicholas I upon his death in March 1855.

By the Treaty of Paris, signed in March 1856, Russia surrendered territories (Moldavia, Wallachia, and Serbia) in the Danubian principalities that it had gained in previous wars, abandoned its demands for recognition as protector of the Ottoman empire's Orthodox subjects, and joined the other signatories in renouncing further interference into the Ottoman empire's internal affairs. The treaty turned the Black Sea into a neutral zone and guaranteed the territorial integrity of the Ottoman empire. Britain and France had succeeded in containing Russia's expansionist ambitions, and Piedmont-Sardinia had garnered support in its pursuit of Italian independence from Austria. Russia's status among

European powers shrunk, while reformers at home interpreted the war as evidence of Russia's need for critical reforms. Russia turned to domestic reforms for the next two decades and withdrew from international politics, which facilitated German and Italian unifications.

Franco-Prussian War

The Franco-Prussian War of 1870–1871 was the third of three wars of German unification. Prussia's victory allowed its minister-president, Otto von Bismarck (1815–1898), to create the German Empire and thereby complete the process begun by the Danish War of 1864 and the Austro-Prussian War of 1866.

The Franco-Prussian War's immediate origins lay in the so-called Hohenzollern Candidature. In early 1870 the Spanish, having overthrown Queen Isabella II, offered their crown to Prince Leopold Hohenzollern-Sigmaringen, Prussian King William I's south German Catholic cousin.

Prussian infantry advance at the Battle of Sedan in September, 1870, during the Franco-Prussian War. The battle was a decisive victory for the Germans, who defeated and captured the sole remaining French field army, along with Napoleon III. The defeat led directly to Napoleon's overthrow and the end of the Second French Empire. (Henry Guttman/Getty Images)

► FIELD MARSHAL HELMUTH VON MOLTKE THE ELDER

Helmuth von Moltke the Elder (1800–1891), chief of the Prussian General Staff during 1857–1888, organized and oversaw the German triumph over France. His preparations for war in the late 1860s, which gave the Prussian army strategic and tactical command methods to fight on broad fronts, enabled Prussia and its German allies to mobilize with an unprecedented speed and efficiency in the war with France. This combined with superior tactics and artillery provided an advantage that the French could not overcome. Von Moltke also oversaw actual field operations, including the siege of Paris. His clashes with Bismarck about the actual role of the civilian leadership in wartime offered a foreshadowing of far more serious civil-military clashes among German leaders during World War I.

—Bruce DeHart

Pressured by Bismarck, Leopold accepted Spain's offer in late June, but when news reached Paris, Emperor Napoleon III's government, fearing Hohenzollern encirclement, threatened war on July 6. Although Leopold withdrew his acceptance, the French government pressed the issue, demanding that William promise that the Hohenzollern candidacy would never be renewed.

Confronted by French ambassador Vincente de Benedetti (1817–1900) at Bad Ems on July 13, William politely rejected the demand, subsequently telegraphing to Berlin an account of what had transpired. To create a crisis with France, Bismarck made public an altered version of the king's telegram that implied that William and Benedetti had exchanged insults. Bismarck's Ems Dispatch inflamed public opinion in both Germany and France, and on July 19 the French declared war.

Superior leadership and organization allowed Prussia and its German allies to mobilize rapidly and seize the initiative. Invading France through the Lorraine gap, German armies won a series of hard-fought victories (Spichern, Vionville, Mars-la-Tour, Gravelotte, and St. Privat) in early and mid-August, demonstrating superiority both in tactics and artillery. They then

bottled up one of the two main French armies, Bazaine's Army of the Rhine, in the fortress city of Metz (August 19) and defeated the second main French force, MacMahon's Army of Chalons, at Sedan (September 1–2). The defeat at Sedan resulted in the capture of Napoleon III and 100,000 French soldiers.

In Paris, French leaders proclaimed a republic and established a Government of National Defense that raised half a million soldiers to continue the war. After Sedan, however, the war's outcome was never in doubt, as the fighting revolved around German efforts to pacify conquered provinces and to force an encircled Paris to capitulate. On January 28, 1871, with Parisians on the verge of starvation, French leaders accepted an armistice. The Treaty of Frankfurt, adopted in May, required France to surrender Alsace and part of Lorraine, pay an indemnity of 5 billion francs, and accept an army of occupation until the indemnity was paid.

Arousing nationalism throughout the German states, the Franco-Prussian War created circumstances in which the leaders of Baden, Bavaria, and Württemberg consented to join with the states of the Prussian-dominated North German Confederation (1867) to form the German Empire on January 18, 1871. Prussia's victory and German unification signaled a new balance of power in Europe, while the harsh peace poisoned Franco-German relations for the immediate future.

War Memorials in Nineteenth-Century Europe

War memorials in nineteenth-century Europe reflected two central concerns that developed out of the French Revolutionary and Romantic eras: recognizing the individual and nationalism. Monuments developed over the course of the century to reflect ever more muscular nationalism

➤ ARC DE TRIOMPHE

The most notable monument of the nineteenth century is the massive Arc de Triomphe, standing over 164 feet (50 meters) high in the center of a traffic hub designed by Baron Haussmann that anchors the Champs-Élysées avenue in Paris. In 1806, to honor his victory at Austerlitz, Napoleon commissioned architect Jean-François Chalgrin to begin the project, completed in 1836. The triumphal arch has ancient antecedents, such as the Ishtar Gate in Babylon, and Roman arches, such as that of Constantine in Rome. A traditional triumphal arch only works if approached from the front or rear, so Chalgrin designed this monument wide enough to have side arches, allowing for the arch effect from all directions. The Arc de Triomphe features large relief friezes of the Napoleonic era, including the departure of the Marseillaise volunteers in 1792 (also celebrated in the French national anthem), the Triumph of 1810, the Resistance of 1814, and Peace. Higher up are depictions of General Marceau's funeral, the Battle of Aboukir Bay, the capture of Alexandria in Egypt, and the passage of the Arcole Bridge during Napoleon's Italian campaign. Chiseled into the walls are the names of hundreds of battles and heroic French soldiers. The flame of the unknown soldier was not added until after the First World War.

—Douglas McGetchin

(James Steidl/Dreamstime)

and an increasing focus not just on the generals and leaders but also on the sacrifices of the common soldier.

Early in the nineteenth century, the Napoleonic Wars received the greatest attention for the construction of war monuments, which ignored the individual soldier. Until the latter part of the century, battlefield dead were tipped into mass graves, and then a tumulus, an artificial mound, was constructed over it. At Waterloo, Dutch king William I had a large mound, the Lion's Hillock, built and crowned with a stone structure featuring a statue of a lion. A noteworthy French monument there is the Wounded Eagle (L'Aigle blessé), marking the spot where Napoleon's Imperial Guard made its last stand. In the course of the nineteenth century, the desire to have individual burials developed. The American Civil War was the first modern war to have its dead buried in

cemeteries. The practice had spread to Europe by the time of the Franco-Prussian War (1870–1871). The introduction of large cemeteries in the nineteenth century reflected the pressures of population growth, especially in urban centers; the increased political consciousness of the masses; and the desire of the wealthy to mark social distinction through their tombs.

Promoting nationalism was another important motivation for constructing war memorials. Germans, for example, developed monuments to affirm their national identity through their defeat of Napoleon. During the struggle against Napoleon, Crown Prince Ludwig of Bavaria (1786–1868) developed the idea of a temple dedicated to great Germans and collected busts and statues of famous Germanic rulers, cultural figures, and generals, including August von Gneisenau, Gerhard von Scharnhorst, and Gebhard von Blücher, all of

whom were Prussian generals in the Napoleonic Wars. To house them, he built Walhalla (1830–1842) overlooking the Danube River outside Regensburg. Modeled on the Athenian Parthenon by the neoclassical architect Leo von Klenze (1784–1864), its name taken from the Norse mythical hall for fallen warriors, it depicts a battle on one frieze. Near Walhalla in Kelheim is the Befreiungshalle (Hall of Liberation, 1842–1863), also designed by von Klenze, explicitly to celebrate the German victory over Napoleon. The exterior features allegorical figures representing German provinces, while the interior commemorates victorious battles, generals, and fortresses.

Another monument to nineteenth-century German nationalism is the Hermannsdenkmal (Monument to Hermann, or Arminius), commemorating the victory of Arminius leading the German Cherusci tribe over three Roman legions in 9 CE in the Teutoburg Forest. The project, begun in 1841, was the brainchild of Ernst von Bandel, an architect in Hanover and Berlin who spent his own personal fortune on the project and received other funding from a national subscription organized by schoolchildren and from the Prussian state. The project was not completed until 1875, four years after German unification, and has been interpreted not only as an inspiration to Germans to defend their nation but also as a symbol of emerging German power.

Nineteenth-century war memorials took a variety of forms, including designs from European and Egyptian antiquity. Memorials were designed to withstand the test of time through the construction of massive structures. The Völkerschlachtdenkmal (Memorial for the Battle of the Nations, 1813) was constructed in Leipzig, Germany, between 1894 and 1913. It included a monumental pyramid base rising to a ring of warrior statues and a surrounding landscape planted with oak trees and featuring open space where nationalistic gymnastic competitions could take place. Nelson's columns in Trafalgar Square, London, and in Dublin (now destroyed) harkened back to classical models such as Trajan's column in Rome. Another important form was the arch, most famously the Arc de Triomphe in Paris. Other nineteenth-century arches include the Bavarian Siegestor (Victory Gate, 1852), crowned with a lion-drawn chariot, and London's Marble Arch, designed

by John Nash in 1828. Another structure used for war memorials was the obelisk, such as Sir Robert Smirke's massive Wellington Testimonial (1861) in Phoenix Park, Dublin, the second largest obelisk in the world. At the base of the Wellington obelisk are large bronze friezes depicting the life of Wellington and the Battle of Waterloo. Some nineteenth-century monuments included a curved wall, such as the Victor Emmanuel monument (1885–1911) in Rome built to commemorate Italian unification.

Although after the Napoleonic era the wars fought in Europe were less frequent, commemorated conflicts included the German wars of unification and the Crimean War. In Berlin, the Siegessäule (Victory Tower) was designed after 1864 by Heinrich Strack to memorialize the war with Denmark over Schleswig-Holstein, but by the time it was built, Prussia had also defeated Austria and France, so officials of the newly united German empire inaugurated the tower in 1873. It features three rings of gold-gilded captured cannons for each war, an observation deck at the top, and is crowned with Friedrich Drake's design of a large golden winged victory holding a wreath with an outstretched hand. The ancient practice of displaying captured enemy weapons occurred on other nineteenth-century monuments, including Sir Richard Westmacott's statue of Achilles (1822) in Hyde Park for Wellington and John Bell's Guards Memorial (1859) in Waterloo Place in honor of those who fought in the Crimean War, cast in the bronze from Russian cannons captured at Sebastopol.

During the era of imperialism, Europeans commissioned monuments in honor of their colonial wars as well. In 1889, statues by Sir William Hamo Thornycroft of General Gordon, killed by the Madhi's army in Khartoum in the Sudan in 1885, appeared in Trafalgar Square (now at Victoria Embankment), London, and near Parliament House, Melbourne, Australia.

These nineteenth-century war memorials reveal an increasing sense of the importance of common soldiers, an awareness that corresponded to the individual empowerment of nonelites who were gaining greater access to suffrage, democratic ideas, and the political process. While monuments were built to exalt nationalism and the power of the state as a beacon for citizen sacrifice, their implicit focus

on loss and mourning also kept open the possibility of viewers' questioning the high cost and even the validity of war itself. The legacy of nineteenth-century memorial sculpture continued well after the First World War.

■ Introduction: War and Warfare in Africa

Warfare played an important role in precolonial African societies, but it differed from the warfare that was common in other parts of the world. On a continent where a great part of the population lived in decentralized societies and even the few large bureaucratic kingdoms that did exist were weak by Eurasian standards, large standing armies were rare. Except in the Sudan, mounted troops also were rare. The prevalence of trypanosomiasis, a disease transmitted by the bite of the tsetse fly, makes it impossible to raise horses in much of Africa. Flintlock guns, most purchased from Europeans and some made by African blacksmiths, were used by fighters in West Africa and Ethiopia, but cannons did not exist, and overall, firearms were less important than they were in Europe or Asia. Most communities had something akin to militia systems in which all able-bodied men were part-time warriors, prepared to protect their homeland and raid neighbors as needed but otherwise were herders or farmers. As a result, conflict in Africa rarely involved large, decisive battles but instead took the form of raids and counterraids among neighboring peoples, with the goal of acquiring livestock, foodstuffs, women, and children rather than territory. Although dismissed by some authors as something less than “true war,” such raiding wars were fought by individuals with a strong warrior tradition, could last for generations, and often brought devastation to the defeated party. Since little distinction was made between combatants and noncombatants, these wars resem-

bled what came to be known in the nineteenth century as “total war.”

In the first part of the nineteenth century, military innovations occurred in several parts of Africa. In the Sudan, religion led to a series of jihads, or holy wars, originally led by the charismatic scholar/reformer Usman dan Fodio (1754–1817) and his son Muhammad Bello (1780–1837). Their army of infantry archers and elite cavalry troops defeated local Hausa rulers, laying the basis for the founding of the large theocratic state known as the Sokoto Caliphate. Their success inspired similar jihads farther to the east later in the century.

In southern Africa, Shaka, a brilliant leader of the Mthethwa, a confederation of Nguni-speaking Zulu tribes, created a new type of state-supported army consisting of approximately 4,000 full-time soldiers who were divided into age-based regiments, housed in barracks, given distinctive uniforms, and underwent systematic training in tactics and weapons use. Shaka's conquests, known as the Mfecane (“Crushing”), led to the formation of a large Zulu empire and disrupted broad swaths of eastern and central Africa, where a number of newly formed kingdoms attempted to imitate the Zulu military system.

Throughout the continent firearms became more available, mainly as a result of increased trade with Europe, whose manufacturers shipped an estimated 16 million firearms to Africa in the 1800s. These weapons, which included modern breech-loading rifles from the 1850s onward, were used to outfit soldiers in

established states such as Dahomey, Ashanti, the Zulu kingdom, and Ethiopia. Many, however, fell into the hands of roving caravan armies involved in slaving or mercenary bands controlled by warlords and given to banditry and extortion.

In the 1870s African military history took a dramatic turn, as the continent became a target for the imperialist ambitions of Great Britain, France, Germany, and Italy, all of which were forced to use military force to make good their territorial claims. In the many wars that ensued, the European powers had superior weaponry (repeating rifles, machine guns, and artillery) and greater financial resources, which allowed them to establish military units specifically designed for colonial service (the French Foreign Legion and the Chasseurs d'Afrique) and recruit large numbers of African soldiers to serve in their colonial armies. They also were adept at taking advantage of the many ethnic and political rivalries among the Africans. Although the Africans won a few spectacular victories, most notably the Zulu defeat of the British at the Battle of Isandhlwana in 1879 and the Ethiopian victory over the Italians at Adowa in 1896, by the early 1900s they had little chance for success against the European invaders. With the exception of Liberia and Ethiopia, by 1914 all of Africa was under colonial rule.

With the onset of colonialism, independent African armies were abolished, and raiding, especially raiding for slaves, was suppressed. Colonial armies, made up overwhelmingly of African infantry troops but officered by Europeans, were established to maintain law and order, guard borders, and protect European business interests. They were small in size. The Royal West African Frontier Force, founded in 1898, had less than 10,000 troops spread over four British colonies: Nigeria, the Gambia, Sierra Leone, and the Gold Coast. The King's East African Rifles, also created by the British, had only 2,400 soldiers in 1913. A larger force was the Force Publique, which under Belgian officers policed Leopold II's Congo Free State. Its 20,000 soldiers had a well-earned reputation for brutality. Unlike the Indian Army, which the British freely used in campaigns outside India, their African colonial armies stayed in Africa itself.

French thinking was different. In the early 1900s, desperate for manpower to face Germany

in what was considered an inevitable war, they began to augment their West African army, the Tirailleurs Sénégalais (Senegalese Riflemen). In 1910 French general Charles Mangin wrote a book, *La Force Noire*, arguing that black Africa could provide France with an inexhaustible number of fighters unspoiled by modern civilization and less sensitive to pain because of their less developed nervous systems. In 1912 France imposed conscription on its West African colonies and continued to do so once World War I began. In all, close to 200,000 black African troops saw action on the Western Front, and 30,000 died.

—James H. Overfield

African Armies, 1750–1900

In 1750 African armies included the massed warriors of stateless societies and chiefdoms, armies of age-set regiments (warriors of a similar age), armies divided by class (cavalries of nobles and infantries of commoners), armies of slave soldiers employed by estate owners, and large standing armies composed of conscripts, slaves, and mercenaries. During the nineteenth century growing trade gave rise to warlord armies that sought slaves and ivory, served as mercenaries, and established new states. Limited war waged by amateurs with handmade clubs, spears, and bows was replaced by devastating wars waged by professionals armed with mass-produced muskets and rifles. However, between 1890 and 1915 better-armed and regularly paid European colonial armies defeated most African armies and established colonies.

In North Africa Mamluk “slaves” trained to be professional soldiers served as troops for Egyptian sultans and became large landowners for centuries before Mamluk leaders were defeated by the Ottoman officer Muhammad Ali in the early nineteenth century, after which Egyptian armies combined peasant conscripts, slave soldiers, and mercenaries, including Americans and Europeans in the 1870s. In northeastern Africa, Ethiopia's modernizing army defeated an Italian force of about 20,000 troops at Adowa in 1896 and thus delayed its colonization by a European power until the 1930s.

In eastern Africa the sultan of Zanzibar's army included Arab, Baluchi, and eventually British mercenaries. Warlords such as Mirambo, the

► DAHOMEY'S WOMEN WARRIORS

During the eighteenth century in Dahomey (now Benin) a band of female elephant huntresses and bodyguards were transformed into an effective fighting force. Under King Ghezo (r. 1818–1858), this unit of female warriors, called Amazons by Europeans due to their alleged similarity to the Amazons of ancient Greece, were strictly trained, provided with uniforms, and armed with Danish firearms. At one point they were estimated to include between 4,000 and 6,000 warriors and to constitute about a third of Dahomey's standing army. Some of these women enrolled voluntarily, while others were forcibly drafted. They were not allowed to marry or to have children while serving in the army. During the Dahomey War (1889–1894), some French soldiers were said to have hesitated before shooting or stabbing these female warriors. During an attack on a French column in October 1892, Dahomey's female fighters advanced without fear and even after they were bayoneted and disarmed continued to fight with their fists, feet, and teeth.

This female corps was disbanded by King Agoli Agbo (r. 1894–1900), but the veterans of this regiment continued to enjoy great prestige and were often photographed and painted. The last surviving member of these famous warriors died in 1979.

*Female warrior of Dahomey beheads an enemy, 1851.
(Mary Evans Picture Library/The Image Works)*

“African Napoleon” of Tanzania, and Nyungu of Kenya used *ruga-ruga* bands of migrating South African mercenaries, while the Swahili-Zanzibari warlord Tippu Tip used an army of clients, slaves, and mercenaries. Pastoralist Maasai armies, composed of age-set units under the control of elders, were transformed into more centralized armies controlled by prophet-diviners, some of whom served in other African and European armies.

In West Africa, Ashanti and Dahomey had armies of professionals, slaves, and female warriors, while Mossi states had cavalries of nobles and infantries of commoners. The army of the Segou Bamana empire in Mali consisted of bachelor associations of warriors with elected leaders. The Rwandan army was composed almost exclusively of Tutsi warriors and was used to dominate the Hutu people, who constituted a large majority of the kingdom's inhabitants.

In central Africa, Muslim states in Cameroon, Chad, and the Sudan sent troops into pagan territories in search of slaves, some of whom were incorporated into these armies. States in the Congo basin employed Chokwe hunters and other mercenaries. Arab and African warlords and their troops ravaged the Congo until defeated by the Belgian king Leopold II's Force Publique, a brutal army that employed many displaced warlord soldiers and was inherited by the Belgian Congo in 1906.

In southeastern Africa, large Chikunda slave soldier armies of Portuguese African estate holders in the Zambezi Valley often defeated warrior bands of nearby polities without standing armies. In the 1870s new warlords arose who recruited former Chikunda slaves and clients to form formidable standing armies. These states were defeated by Portuguese armies and local auxiliaries

only with great difficulty. In southern Africa (ca. 1820) the South African warlord Shaka expanded a disciplined army of youth regiments with assimilated captives to form a highly militarized Zulu state. His soldiers, strictly disciplined, used stabbing spears and envelopment tactics. To his north, the Swazi and Sotho welcomed refugees and built armies that fought off African and Boer rivals and survived as states under British protection. During the South Africa War (ca. 1900) Boer (Afrikaner) guerrilla militias were defeated with great difficulty by a huge British army, the largest ever employed in Africa.

Between circa 1880 and 1915 European colonial armies (French *tirailleurs*, British African Rifles, Portuguese *sepias*, and Belgian Force Publique), using mercenaries and auxiliaries, defeated most rival African armies. The imposition of monopolies on the use of force by colonial armies eventually reduced or eliminated slave raiding and pillaging by warlord armies, but these armies were then often employed to impose forced labor on conquered peoples rather than to defend colonial borders. Colonial armies thus served foreign rulers rather than local peoples or polities.

Military Changes in South Africa during the Early Nineteenth Century

Historians once believed that Shaka, founding ruler of the Zulu Kingdom from circa 1815 to 1828, introduced a number of military innovations that revolutionized warfare in Southern

Africa. It was believed that prior to Shaka, African conflicts were characterized by limited warfare and minimal loss of life. Shaka supposedly introduced a short stabbing spear that was better for hand-to-hand fighting, developed more aggressive encircling tactics, created a new system of age regiments that promoted military cohesiveness, and generally promoted something akin to total warfare. Most historians now believe that most of these changes preceded Shaka and that the Zulu kingdom, though an important new state, was not at the center of events in early-nineteenth-century southern Africa. Therefore, the most significant military changes were in how Africans adapted their military methods to more effectively resist early European colonial intrusion.

During the late eighteenth century, the sporadic frontier warfare in the eastern part of the Cape lacked any decisive result as the Xhosa had the advantage of superior numbers, which the Boers compensated for by the firepower and mobility provided by guns and horses. However, neither group could field a large standing army capable of fighting for a protracted period since Xhosa and Boer men had to abandon raiding and return to their productive duties at home. The permanent British takeover of the Cape Colony in 1806 shifted the balance of power toward the colonial side as a standing army was developed that could be supplied by the settler community. In 1811 a combined force of British soldiers, including artillery and cavalry, and Boer militia drove the Xhosa east across the Fish River, which was then proclaimed the new colonial border. In 1819 the Xhosa of Ndlambe, inspired by the millenarian prophecies of Nxele, launched a daylight assault on the colonial district capital of Grahamstown but were slaughtered by firearm-equipped soldiers and settlers hiding behind improvised barricades.

Learning from this disaster, the Xhosa, during the rest of their many nineteenth-century wars against colonial forces, made increasing use of firearms and attempted to minimize the colonial advantages of firepower and mobility by only fighting in the rough terrain of mountains and forests. During the Cape-Xhosa wars of 1834–1835, 1846–1847, and 1850–1853, the Xhosa employed elusive hit-and-run tactics that concentrated on attacking British supply lines. The British countered this by ignoring the Xhosa

warriors and destroying the fields and herds that supported them. In the 1850–1853 conflict, the Xhosa leader Maqoma attempted to distract the British from attacking the productive center of Xhosa society in the Amatola Mountains by taking a small band of fighters, including some Khoikhoi mutineers from the colonial army, into the Cape Colony. There, he established a stronghold in the thick forest of the Waterkloof highlands from which he attacked settler farms. This strategy was only successful for a time. The Xhosa could not change the nature of production in their society, and in all these conflicts they surrendered because of widespread hunger.

The Kingdom of Lesotho provides another good example of African military adaptation in this period. Basotho people rallied around the leader Moshoeshe in the early 1820s and established a defensive state among the flat-topped mountains of the Drakensburg range. Lesotho was harassed by the migrant Ndebele and Ngwane, who were bought off by gifts of cattle, but far more serious was raiding by the mixed-race Griqua, who employed horses and guns to capture livestock and slaves for trade to the settlers of the Cape Colony. Eventually, the Basotho acquired enough guns and horses to develop a cavalry-based army that was able to defeat a British invasion in the early 1850s. However, constant warfare with Boer settlers in the late 1850s and 1860s resulted in loss of agricultural lowlands and prompted Moshoeshe to bring his state under British protection in 1868.

Despite its martial reputation, one of the least successful examples of military adaptation was the Zulu kingdom. It was one of a number of new African powers to emerge in this region during the early nineteenth century but was easily defeated by Boer settlers, who employed guns, horses, and impromptu fortifications, at the Battle of Blood River in 1838. The Zulu proved unable to learn from this calamity and did not incorporate firearms into their military system in any significant way.

Colonial Armies in Africa

Armies were organized by the colonial powers in Africa as the primary means to conquer territory and maintain order. Because of limited budgets and climate, relatively few Europeans served in Africa. Instead, the colonial powers depended mostly upon native people recruited and trained for the purpose.

The development of colonial armies was similar throughout most of Africa. Before the European conquest, professional standing armies did not exist. Most armies were raised to meet specific crises, and each adult male was responsible for taking up weapons and serving as assigned. Nobles, for example, might serve as cavalry, while commoners were restricted to infantry auxiliaries. Discipline was nearly nonexistent, as were logistics. Warriors were armed with traditional weapons and followed the same leaders who controlled the civil society. Campaigns were short and usually limited to the dry season so that men could return for planting.

As some African societies became more developed, their armies changed as well. Firearms were introduced, thanks mostly to Muslim traders from North Africa. Standing armies were organized in some states and were composed mostly of slaves. These slaves were most often outsiders who had no ties to the communities in which they served. Some armies served to maintain social order, with combat playing only a minor role.

The arrival of Europeans, beginning with the Portuguese in the 1500s, changed this pattern. European forces upset traditional balances with superior armor and weapons. Some African rulers recognized their value and allied themselves with the invaders. Europeans played the

➤ AFRICAN COLONIAL TROOPS DURING WORLD WAR I

Allied and German propagandists tried to make the most of their supposed savagery. (Library of Congress)

role of heavy infantry and proved decisive in battle. For centuries, however, European control in Africa was limited. They found the climate unhealthy, and thousands died of disease. Governments were also unwilling to pay large sums to maintain armies in foreign lands.

Conditions changed in the nineteenth century, however, as European countries began

competing for the control of Africa. Climate and budgets continued to limit the number of European soldiers who were sent, so the colonial powers began to recruit Africans in their colonial armies. The nineteenth century was a time of great internal flux among the African states, so the European powers were often able to take advantage of local disputes to gain footholds in various regions. The same upheavals made available many African men who were willing to serve in colonial armies. As a result, the armies that conquered colonial empires in Africa were overwhelmingly African.

Africans who enlisted in the colonial armies held a number of advantages over the African armies opposing them. First, they were armed with up-to-date military technology, including magazine rifles, machine guns, and artillery. The training was superior to anything the African states could provide, with the emphasis on the effective use of firepower. Logistics was another significant advantage for European-trained forces. Although the colonial armies were usually smaller than the opposing armies, they rarely were defeated.

Known by names such as *tirailleurs sene-galais* or *askaris*, African soldiers were usually organized into units no larger than a battalion. Most were armed as light infantry, since that was the most versatile and economical type of unit. Specialized or technologically advanced troops, such as communications units, were not provided or were left to Europeans. Naval and flying units were closed to Africans as well. After colonial empires were established, most native troops were used to keep order among the populations. They were stationed in the interior and often developed a reputation for brutality against other Africans. Recruits were drawn from specific tribes considered to be more martial or aggressive. Units were rarely stationed among their own ethnic groups, and fraternization with civilians was discouraged. Unlike pre-colonial days, the military was separated from the society in which the troops lived.

Colonial armies were characterized by the openly racist prejudices and attitudes of the officers. All officers were white, as were most noncommissioned officers. Even when Africans managed to reach the noncommissioned officer

rank, they were paid less and received fewer benefits than their white counterparts. Even so, a military career provided a good standard of living for most Africans. Obedience to authority was the one quality stressed above all others, and during the colonial period few African units ever rebelled against their colonial masters.

Most European governments viewed the colonies as manpower pools in the years before World War I. When war broke out, the French in particular called over 180,000 African soldiers to serve on the Western Front. This proved to be a turning point for many African soldiers, some of whom were exposed to new political ideas and lost their servile attitude toward whites. The African soldiers understood that they had the ability to fight against white men and win. Although it took decades, the veterans of the colonial armies took their places among the leaders of independence movements in Africa.

Ethiopia's Army under Menelik

Under Emperor Menelik II (1889-1913), Ethiopia became a relatively modern, independent, and centralized state, recognized by European colonial powers. One of the most important tools Menelik used to achieve this goal was the Ethiopian army. During his rule, the army transitioned from a feudal force into a professional outfit armed with modern weapons.

Ethiopia has maintained a national identity for thousands of years. Isolated to a certain extent by mountains and deserts, it was rarely attacked by outside invaders. During the nineteenth century, however, Ethiopia's existence was threatened by the rush of European

colonization. To survive, the country's rulers recognized that they needed to move from a feudal society to one more in keeping with the European model. The first great modernizer was Tewodros, who came to power in 1855. His reforms failed to last because they lacked any economic and technological base. Tewodros tried to develop a national army by organizing units with men from all across Ethiopia. He also tried to instill greater discipline. Tewodros imported as many European arms as possible and created the first armory in Ethiopia at Maqdala to manufacture weapons. Johannes IV, the successor of Tewodros, continued his modernizing efforts. Johannes hired British sergeant John Kirkham to provide military advice and to train his troops and also instituted a system of regular pay and discipline. Johannes's army defeated European-trained and -armed units from Egypt that invaded in 1875 and Italian forces in 1887.

Of all these reformers, Menelik was the most successful. As hereditary ruler of Shawa in southern Ethiopia, Menelik consolidated his power and extended his control over regions to the south and west. Emperor Johannes became concerned that Menelik might overthrow him and in 1878 led a force against Shawa. To avoid a protracted war, Menelik recognized Johannes's authority. Johannes continued to strengthen his army by exporting products to European markets and buying weapons. The Italians were his best suppliers, loaning him money to buy arms.

Menelik proclaimed himself emperor when Johannes died. Other claimants quickly submitted to Menelik, thanks to his powerful army. As emperor, Menelik created a standing national army and by 1896 had imported over 70,000 modern rifles with magazines, along with 5 million cartridges. Provincial forces existed, but Menelik controlled the number of modern weapons available to them. Campaigns were timed so that soldiers could return to their homes between June and September to plant and harvest crops. Troops were paid through the Geber Madriya system, in which soldiers received grants of land and the payment of food, drink, and other essentials in exchange for their service. This system allowed Menelik to raise large armies for service within Ethiopia without having to provide hard currency. In 1902, a military parade through

Addis Ababa included 600,000 armed soldiers. A small Corps of Gunpowder and Shell was established by Menelik to control artillery.

Under Menelik, a treasurer of finances and other officials supervised logistics for the army. Supply depots were established, especially in regions that suffered from famines. When surrounding regions were conquered and incorporated into Ethiopia, military garrisons and bureaucrats maintained order and helped integrate them into the system.

Menelik's greatest military challenge came in 1895–1896, when Italy invaded the province of Tigre. Pacifying the region took nearly ten months, months during which Menelik established supply depots and imported arms. He proclaimed a national mobilization in September 1895. The national army of 80,000 men was joined by smaller groups of soldiers under regional governors. By the time he met the Italians at Adowa on March 1, 1896, Menelik had over 100,000 well-armed soldiers. To the Italians' surprise, the Ethiopian forces proved to be their technological equals and inflicted an overwhelming defeat on them. Menelik's victory and his army confirmed his importance as the founder of modern Ethiopia.

Cape Frontier Wars

The Cape Frontier Wars were nine interconnected conflicts that took place in southern Africa between 1779 and 1878. These wars, also called the Kaffir Wars (from the denigrating generic term for all blacks, meaning “infidel” in Arabic), were caused generally by Boer (Dutch colonist) expansion and encroachment upon frontier indigenous tribes, with the British being frequently drawn in to protect the colonists.

The British first occupied the Cape of Good Hope area in South Africa in 1795. Initial conflict

took place as the Boers spread eastward and encroached on Xhosa land, and a cycle of reprisals, generally involving land and cattle, began. Later conflicts focused on the ever-expanding eastern frontier of Cape Colony, around the Great Fish River and the Amatola Mountains. Cape Frontier Wars were fought in 1779, 1793, 1799–1802, 1811–1812, 1818–1819, 1834–1835, 1846–1847, 1850–1853, and 1877–1878.

The Sixth Cape Frontier War (1834–1835) began when Chief Maqoma of the Gaika tribe attacked Cape Colony at the end of 1834. White settlers retreated to Grahamstown and other defended posts. When word of the invasion reached the capital, Cape Town, the military commander, Lieutenant Colonel (later Lieutenant General Sir) Harry G. W. Smith, rode 600 miles in six days with a single orderly and arrived in Grahamstown on January 6, 1835. Smith organized and led the defense of Grahamstown and with mainly local troops, including 3,000 Boers, drove Maqoma's force from the frontier. Governor Sir Benjamin D'Urban, with Smith as his second-in-command, led a four-column force into Xhosa territory in March 1835. After a brief conflict, the Xhosa returned cattle they had stolen and accepted a peace arrangement.

The War of the Axe is another name for the Seventh Cape Frontier War (1846–1847) because it reportedly started when indigenous locals were caught stealing an axe at Fort Beaufort. The thief was sent to Grahamstown for trial, but the escort was ambushed and the prisoner freed. After the Xhosa refused to return the prisoner, the British sent a force to punish and destroy a Xhosa settlement, but this force was repulsed. The British sent a mounted column that defeated the Xhosa at Guanga on June 7, 1846. Other engagements took place, and the Xhosa chiefs eventually surrendered. By December 1847 when Smith returned as governor and commander in chief of Cape Colony, the war was basically over. Cape Colony's territory was extended to the Orange and Keiskamma rivers, and the area between these rivers was annexed as British Kaffraria on December 23.

Numerous cross-border engagements took place during the Eighth Cape Frontier War (1850–1853), which ended after a war of attrition basically destroyed the crops and cattle of the Xhosa.

The power of the Xhosa was finally crushed in the Ninth Cape Frontier War (1877–1878). The last British commander in this later war was Lieutenant General (later General) Frederick A. The-
siger (later Second Baron Chelmsford), who may have thought that the feeble resistance of the Xhosa characterized the fighting abilities of all African tribes. He would learn during the Zulu War (1879) that this was not true.

The Wars of Shaka

During the early 1800s people in southern Africa experienced a period of upheaval characterized by increased violence, long-distance movement of peoples, the destruction of old states, and the emergence of new larger kingdoms. Historians once believed that this had been caused by the emergence of an aggressive and expansionist Zulu Kingdom under the leadership of Shaka. Since the late 1980s, revisionist historians have argued that these events were caused by various forms of colonial raiding originating from different parts of the region. Shaka's allegedly central role was created and exaggerated by colonial writers who wanted to deflect attention from their own unsavory activities. While the debate over this issue has never been fully resolved, most historians today do not accept the old view that Shaka's Zulu caused the period of turmoil once known as Mfecane (Crushing).

For many years historians were confident that they knew the story behind the turbulence of early-nineteenth-century southern Africa. Shaka had given his new Zulu state military

superiority over other African groups by inventing a new short stabbing spear that was particularly effective in hand-to-hand combat, introducing new battlefield tactics of encirclement, and creating a system of organization based on age regiments. From around 1815 to the late 1820s Shaka led the Zulu in a series of wars against neighboring Africans who were either incorporated into the new kingdom or driven away. For example, Sotho people rallied under their new leader Moshoeshoe in the mountain sanctuary of the Drakensberg. Mzilikazi, formerly an ally of Shaka, took his Ndebele group into the central part of what is now South Africa, where they used new Zulu military methods to dominate that area until attacked by Boer settlers in the late 1830s. Allegedly, the Mpondo Kingdom of Faku lost all its cattle to raids from the neighboring Zulu and had to abandon almost half its territory. Refugees fled along the Indian

King Shaka was the founder of the Zulu Empire in South Africa. By unifying the northern Nguni people of Natal, he built one of the most powerful states in nineteenth-century Africa and held it together through intimidation and terror. (National Library of South Africa [Cape Town])

Ocean coast, were eventually taken into Xhosa society as the Mfengu or Fingo (from Ukumfenguza, meaning “to seek work”), and were supposedly rescued by the British Army in 1835, when they were brought into the Cape Colony under the protection of Christian missionaries. Central to this view of history was that Shaka’s wars had depopulated much of the central part of what is now South Africa, which made it easy for Boers to expand into that area during the Great Trek of the late 1830s and 1840s. Although colonial historians of the early twentieth century viewed Shaka as a monstrous savage and later African nationalist historians saw him as a revolutionary nation-builder, the basic history remained the same.

Revisionist historians claimed that the violence and turmoil of early-nineteenth-century southern Africa had not been caused by Shaka but rather by violent colonial intrusion. The Portuguese at Delagoa Bay and British privateers at Port Natal sponsored slave raiding into the interior. The Griqua, a frontier society of raiders with horses and guns, attacked Africans in the interior and traded captured cattle and slaves to the settlers of the Cape Colony. Along the eastern frontier of the Cape Colony, settlers and British soldiers organized raiding parties to attack the neighboring Xhosa and other groups. African leaders such as Moshoeshoe, Mzilikazi, Shaka, and Faku were responding to the threats and sometimes opportunities brought by these new forces. All of Shaka’s supposed military innovations existed before he had been born, but what he did was create a larger state that could more effectively respond to the new situation.

New evidence, including recorded Zulu oral history, clearly illustrates that the Mpondo of Faku were not the hapless victims of the Zulu and launched their own predatory attacks on smaller groups. The only successful Zulu raid against the Mpondo occurred in the late 1820s when Shaka cooperated with European-led gunmen from Port Natal. The so-called Mfengu were actually Xhosa-speaking captives and collaborators who were taken into the Cape Colony to serve as a steady supply of labor for settler farms. The central part of what is now South Africa had not been depopulated by Shaka but instead was

conquered by expansionist Boers who would later claim it as a promised land given to them by God. Earlier colonial historians had created the myth of the wars of Shaka in order to blame inequity of land ownership on so-called black-on-black violence rather than on colonial dispossession.

Some historians claim that this revisionist theory removes African initiative from history and places too much emphasis on colonial actions. There are questions about exactly when the Portuguese slave trade started at Delagoa Bay and if it was early enough to have caused these events. There has been considerable objection to the accusation that missionaries, in the age of abolitionism, played a role in colonial labor raiding.

Ashanti Wars

The brief conflicts known as the Ashanti Wars (1873–1874, 1895, 1900) were the result of British commercial involvement in the tribal affairs of the Gold Coast in West Africa. The wars resulted in the subjugation of the Ashanti Kingdom to the British Empire.

The British were primarily interested in maintaining open trade routes, a goal complicated by the rivalry that existed between the coastal Fante and the more powerful Ashanti inland. The basic British policy involved dealing with the Fante directly and signing a series of (rapidly ignored) treaties with the Ashanti. In

1871 the Fante tried to form a coastal confederation to unite their clans against the Ashanti. Despite a quick and decisive British rejection of the idea, as the effort was seen as an attack on British control of the area, the move provoked an Ashanti offensive on the coast to smash Fante pretensions to power in 1873. If the British had been unwilling to allow the Fante to govern themselves, they certainly were not going to allow the Ashanti to do so.

A British force of 2,500 men under the command of Major General Sir Garnet Wolseley was dispatched to the Gold Coast. His British regulars formed the core of a column that marched inland to the Ashanti capital of Kumasi. Early in April 1874, Wolseley sacked and burned Kumasi and forced the Ashanti to accept a treaty renouncing all claims of coastal authority. They were also forced to pay a large fine in gold dust, pledge to keep the roads to the interior open, and promise to give up the practice of human sacrifice.

Despite the decisive defeat, the Ashanti remained troublesome to the British. During the 1880s and 1890s, the Ashanti showed signs of planning a move against the coastal clans again, prompting a British accusation that they had broken the provisions of the treaty imposed in 1874. British authorities demanded that the kingdom accept status as a British protectorate in 1895; when the demand was ignored, British forces again marched on Kumasi, installing a resident at bayonet point and exiling the royal family to the Seychelles. Five years later the governor demanded that the Ashanti surrender the Golden Stool, the symbol of their sovereignty, provoking a final Anglo-Ashanti war. The kingdom was annexed in the aftermath as a Crown colony.

French Conquest of Algeria, 1830–1857

On the eve of the French invasion of 1830, Hussein Dey (1765–1838) governed the Ottoman regency of Algiers. He and his *diwan* (governing committee) administered a multiethnic, hierarchical, and decentralized North African state extending to the Sahara that comprised three regions (*beyliks*), each with substantial autonomy. Hussein and Ottoman provincial representatives (*beys*) engaged in reciprocal and often contested relationships with local leaders and assemblies, and legal codes varied. France was ruled at the time by an authoritarian and increasingly unpopular King Charles X, who ordered an invasion of the regency under the dubious pretext of Hussein's swatting of a French diplomat with a flywhisk in 1827. In fact, the invasion was motivated by a number of factors, including the debt owed by France to the regency (in terms of financial loans as well as its supplying France with wheat during the Revolutionary period) and the desire to divert attention from domestic instability by reviving the glories of Napoleonic conquest.

Having landed at Sidi Ferruj on June 14, 1830, French troops supported by naval bombardment reached Algiers by July shortly before Charles X was deposed in France during the July Revolution. Hussein evacuated the Casbah, or citadel, of Algiers and shortly thereafter surrendered. French forces plundered the regency's treasury. The initial objectives of the invasion were punitive rather than a permanent occupation. French governments after 1830, unwilling or unable to extricate France from Algeria, pursued a hesitant and often ambivalent policy of formal occupation and colonization, which would eventually result in the annexation of Algeria as French territory in 1848.

Despite the victory in 1830 over Hussein and the deportation of Turkish administrators and merchants, most of the regency's territories remained independent of French control. Local and regional elites pursued negotiation and cooperation with or armed resistance against the invaders. In some cases, faced with the dissolution of Ottoman rule, local leaders elected

representatives to administer their territory and fight the French. In the eastern beylik of the province of Constantine, Ahmed Bey's council proclaimed him pasha (governor). He organized resistance with the support of Kabyle troops. From his capital in Constantine, Ahmed Bey's initiatives included the uniting of many extended families in the region, petitioning Britain to protest the French invasion, and the printing of currency to maintain administrative and economic control. Ahmed Bey's forces repulsed the French expedition under General Bertrand Clauzel in 1836. In 1837, 20,000 French troops finally succeeded in occupying Constantine after inflicting heavy casualties on its population.

The most sustained resistance to the French invasion was led by Abd al-Qadir, who would become a national figure of resistance. The son of an influential religious leader and a scholar himself, in 1832, at the age of 24, Abd al-Qadir was appointed emir (commander) by a congress of notables. He engaged in military campaigns but also negotiated a number of treaties with the French (including the Treaty of Tafna, signed in 1837 after suffering a defeat against General Thomas Robert Bugeaud). After a brief cessation of hostilities, warfare broke out again in the 1840s. Under Bugeaud, the French pursued a policy of collective reprisals, including massacres, the suffocation of entire communities hidden in caves, the destruction of crops and villages, and the forced resettlement or internment of hundreds of thousands of people. Abd al-Qadir's *smala*, or mobile government and retinue, was seized in 1843, and his substantial library of manuscripts was burned. In late 1847 he surrendered and was eventually exiled. Although the French initially estimated that 10,000 troops would be sufficient to pacify Algeria, by 1847 more than 100,000 troops were struggling to control a population of approximately 3 million. Algerian casualties of war in the first 45 years of the French conquest, not including deaths due to famines exacerbated by the French seizures of land and suppression of public charities, has been estimated at 825,000.

Kabylia, one of the last strongholds against the French conquest, finally succumbed in 1857. Although 1857 is the conventional date for the end of the conquest, the southern regions of

modern-day Algeria remained formally independent, and insurrections continued until independence in 1962.

French Wars of Conquest in West Africa

In 1854, French possessions in West Africa, like those of other European powers, were minuscule coastal and riverine trading enclaves, more or less under African control. In that year, however, taking advantage of their exclusive possession of the navigable lower and middle Senegal River, the French military began to intervene forcibly among the Senegalese states in order to impose favorable terms of trade for French merchants. The French conquest of West Africa had begun.

These first French actions against their Woloff, Mauritanian, and Toucouleur neighbors drew inspiration from the French conquest of Algeria that, having begun in 1830, offered a model of apparently successful military colonialism. Ambitious infantry and artillery officers adopted this model, including the willful manipulation of military reports and multiplication of campaigns, in order to earn rapid promotions by extending French domination. In addition, these officers exploited the bogey of militant Islamic opposition to French rule to justify actions to eliminate Muslim rulers. After 1871, French officers and civilian administrators would additionally become imbued with Jacobin-influenced republican ideals that would move them to reject most power sharing with West African traditional rulers, Muslim or non-Muslim, except as temporary expedients. Eventually most African rulers and their states were eliminated.

Two periods (1854–1861 and 1861–1863) during which General Louis Faidherbe, an engineer officer with Algerian experience, governed Senegal served as a prelude to post-1878 French conquests. Adapting orders from Paris to local realities, Faidherbe led a series of limited river- and land-based operations against the Mauritanian, Woloff, Toucouleur, and Sarakhollé states of the Senegal River valley, resulting in French military control of the banks of the navigable western portion of this river. Faidherbe's forces undertook similar actions along the Atlantic coast south of Saint-Louis and inside the navigable reaches of the Saloum and Casamance rivers. Faidherbe's campaigns also forced the Toucouleur state builder, El Hadj Omar, to move his center of operations to Ségou on the middle Niger River.

In 1857, Faidherbe created the first companies of Senegalese Riflemen, a model of native African military recruitment that French commanders would replicate as they moved inland. Native levies and the warriors of African allies would provide the bulk of French military manpower in West Africa.

The fabled (but mythical) wealth of Timbuktu, to which was added the assumed strategic value of Lake Chad, constituted the magnets that attracted French expansion inland from the upper Senegal as well as from Algeria and the coastal points that would become Guinea, Côte d'Ivoire, Dahomey (Benin), and Gabon. The decision taken in 1880 to open a series of fortified posts and to build a railway linking Kayes, at the head of navigation on the Senegal River, to Bamako, on the middle Niger River (occupied in 1883), led to armed conflict with the Toucouleur empire, ruled since 1864 by El Hadj Omar's eldest son, Ahmadou, and with the empire of the Dioula state builder, Samori Touré.

To successive French commanders of this region, particularly Gustave Borgnis-Desbordes (1880–1883), Joseph Simon Galliéni (1886–1888), and Louis Archinard (1888–1891 and 1892–1893), the Toucouleur empire, because it blocked the way to Timbuktu, had to be destroyed. This task, completed in 1893, was accompanied by lesser campaigns against former Bambara, Toucouleur, Sénoufo, and other African allies who were no longer needed.

➤ KÉNIÉDOUGOU—BETWEEN SAMORI AND THE FRENCH

Kéniédougou, a Sénoufo/Dioula successor state of the eighteenth-century empire of Kong, made valiant attempts to resist conquest by both Samori Touré and the French. Kéniédougou's ruler, Fama Tiéba, who had strengthened the kingdom during the 1870s, established his capital at Sikasso in what is now southeastern Mali. In 1887–1888 Sikasso successfully resisted a 16-month siege initiated by Samori.

The French military leadership in the western Sudan, then technically at peace with Samori but preparing the next campaign against him, encouraged Tiéba to resist Samori, even providing him with arms and ammunition and persuading his envoys to sign a vague French protectorate treaty.

In 1898 when the French commander of the western Sudan, Lieutenant-Colonel H. M. Audéoud, decided to station a French garrison in Sikasso, Fama Babemba, Tiéba's successor since 1893, flatly rejected the idea. Consequently, Audéoud's forces attacked Sikasso.

After a short but violent siege, Audéoud's artillery pierced the town's three concentric mud-clay walls. After violent house-to-house combat on May 1, 1898, the French forces sacked and burned Sikasso. Fama Babemba committed suicide before he could be captured. Samori, very demoralized by this French success where he had failed, was captured by Captain Gouraud less than four months later.

—Leland Barrows

As the French communication lines linking the upper Senegal and the upper and middle Niger regions grazed the northern rim of the area where Samori Touré was building his empire, a clash occurred at Keniéra, south of the Niger River, in February 1882. Later, periods of hostilities alternated with periods of uneasy peace, as Samori, attempting to avoid the French, shifted his area of state building from upper Guinea to northern Côte d'Ivoire. In September 1898 Captain Henri-Joseph Gouraud, commanding a small detachment of mostly African troops, captured Samori inside Liberian territory.

While the French were combating these African adversaries, they were also contending

with instances of dissidence among presumed allies and suppressing numerous rebellions. The establishment of this region as an autonomous military command in 1880 was a stimulus to independent actions on the part of its commanders. The French occupation of Timbuktu in 1894 was one such action.

The eastward-moving struggle against Samori offered the French an impetus to link the French enclaves farther down the West African coast to the interior. This process sped up and expanded after the 1885 Berlin West Africa Conference established rules for the effective European occupation of African territory.

In 1899 French columns from Algeria, the western Sudan, and the French Congo converged near the southern shore of Lake Chad, at Kousséri. Here the combined forces defeated the Sudanic state builder Rabah Zoubeir. Although this battle is often viewed as marking the close of the era of the French conquest of West Africa, French forces, for many more years, would fight smaller campaigns in outlying areas, such as the region of southern Côte d'Ivoire. As a kind of afterthought, France began the pacification of Mauritania in 1905, a task that would drag on until 1938.

Italian-Ethiopian War

The Italian-Ethiopian War of 1895–1896 is one of the few occasions in modern times in which non-Europeans decisively defeated a European power bent on conquest. The war capped years of efforts by the Italians to create an empire in eastern Africa. These Italian ambitions came into conflict with Ethiopian claims of sovereignty over Eritrea, an area controlled by feudal

warlords who often did not accept any higher authority. The superior weapons and greater number of troops led to an Ethiopian victory over a demoralized Italian army that suffered from the local conditions.

After Italy's unification in 1861, many Italians were eager to establish their country as a major power among the European states. Some Italians believed opportunities to do so existed in the Red Sea region, especially by establishing a colony in Eritrea. Italian penetration into the region began when the Italian Società di Navigazione Rubattino (Rubattino Shipping Company) purchased Assab, a port on the Red Sea near the straits leading into the Indian Ocean, from local rulers in November 1869. Assab was the main gateway for products going to and from Ethiopia. On July 5, 1882, the Italian government took possession of Assab, raising Ethiopian fears of further Italian penetration. These fears were heightened three years later when Italian troops occupied the important Eritrean port of Massawa, 400 miles to the north of Assab.

Ethiopian and Italian troops clashed briefly in 1887 along the disputed border between Eritrea and Ethiopia. To prevent further conflict, the governments negotiated and signed the Treaty of Wichale on May 2, 1889. The Italians agreed to recognize Menelik II as emperor of Ethiopia in return for his acceptance of their presence in Eritrea. The Italian copy of the treaty, however, indicated that Italy would control Ethiopian foreign relations. Menelik soon became aware of this clause and committed himself to challenging the Italian claim. Over the next four years, he consolidated his power and continued to import modern weapons. In 1893 he repudiated the treaty, setting the stage for war.

At the time, General Oreste Baratieri was the Italian colonial governor and commander of the military forces in Eritrea. He had little respect for Ethiopian military abilities and spoke publicly of bringing Menelik to Italy in a cage. An opportunity to expand Italian power into Ethiopia occurred in December 1894 when Batha Agos, chief over Okule Kasai, a province claimed by both Ethiopia and Eritrea, imprisoned several Italians. Soldiers sent by Baratieri killed Batha Agos, but his followers fled to the Ethiopian province of Tigre. When the governor

► THE IMPACT OF THE BATTLE OF ADOWA

The Italian defeat at Adowa had far-reaching effects. War with Ethiopia divided Italian society. Many Italians, especially the socialists, had opposed imperial expansion in eastern Africa, convinced that the money used could be better spent in Italy. Many working-class Italians also opposed the war since their sons were conscripted for duty. The slaughter of Italian boys at Adowa resulted in riots in several large Italian cities, including Pisa and Milan. The Crispi government fell and was replaced by that of Liberal Conservative Antonio Starabba. Internationally, Adowa was an embarrassment to Italy. Anxious to prove itself as a major power, Italy was the only European

power defeated by a native army. The hundreds of Italians who were taken prisoner at Adowa were humiliated to have been captured by black men. The myth of racial superiority was exposed. For some Italians, the experience led to a desire for revenge. Benito Mussolini, the founder of fascism and after 1922 the dictator of Italy, claimed that he was completely engrossed by the thought of wiping out the humiliation of Adowa. Mussolini eventually invaded Ethiopia on October 3, 1935. His modern forces used poison gas and terror bombing to break the Ethiopian resistance. Within two years, Ethiopia was conquered.

—Timothy J. Watts

refused to give them up, Baratieri invaded Tigre in January 1895, and the war began.

The Italians quickly defeated the local forces and occupied Tigre. Baratieri spent the next ten months consolidating his position and encouraging rebellions against Menelik. Menelik spent the time importing additional arms and encouraging an antiwhite attitude among Ethiopians. When Baratieri began to march on Addis Ababa in October 1895, Menelik mobilized 150,000 men to meet him.

Clashes at Amba Alagi in December 1895 and at Mapele in January 1896 resulted in Ethiopian victories. Baratieri responded by repositioning his army near Adowa in February. He was confident that the Ethiopians did not have the logistical support to maintain a large army for very long. By delaying a battle, he hoped that Menelik's army would melt away. Baratieri's army, however, suffered from supply shortages due to a lack of transport animals. Many of his soldiers, recent conscripts from Italy, were in poor health because of the heat and dry conditions around Adowa.

Baratieri's strategy of delay was upset, however, by pressure from Rome. Italian prime minister Francesco Crispi considered it an embarrassment to be stymied by an African force and ordered Baratieri to force a battle. While Baratieri had more than 20,000 men, nearly half were *ascaris*, native troops serving Italy. They were armed with older single-shot rifles, while

Italian officers pose before the Battle of Adowa, a conflict that occurred on March 1, 1896, during the Italian-Ethiopian War. (Library of Congress)

the Italian soldiers had modern magazine-fed rifles. Baratieri believed that his inferiority in numbers would be outweighed by a qualitative edge. He ordered a surprise attack for March 1, 1896. Menelik's army had dwindled to 100,000 men, but most were armed with modern French repeating rifles, and his artillery was qualitatively superior to that of the Italians as well.

For the Italians the attack went badly from the start. Italian guides and maps were unreliable, and four columns of troops ended up in the wrong positions. At dawn the Ethiopians attacked. The Italian left-hand column had

advanced farther than the others and was cut off and destroyed. The Ethiopians then attacked each of the other columns in turn. Baratieri, who was hampered by the loss of his glasses and could not see the action, ordered a retreat at midday, but it quickly turned into a rout.

Nearly 8,000 Ethiopians died in the fighting, proportionately far fewer than the Italians, who lost 70 percent of their army. More than 4,000 Italians and 2,000 African *ascaris* were dead, while another 3,200 were wounded or captured. For the first time in modern history, an African army had defeated a European one. The results of the battle shocked the Italian people. Baratieri was replaced by General Antonio Baldissera, who rebuilt his forces and maintained Italian control over Eritrea. Crispi's government fell as a result of the defeat. On October 26, 1896, Ethiopia and Italy signed a peace treaty in which Italy recognized Ethiopia's full independence.

British Conquest of the Sudan

Sudan in the late nineteenth century was a dependency of Egypt, and so when Britain

occupied Egypt in 1882 it also assumed responsibility for the Egyptian occupation of Sudan. Thus when a religious uprising resulted in the annihilation of the Egyptian army in November 1883 and the capture of Khartoum, the capital of Sudan, in January 1885 Britain felt compelled to intervene, not only to restore order but also to forestall other colonial powers from assuming control of the country.

The religious uprising began in the early 1880s when the Arab minority in Sudan coalesced around Mohammed Ahmad, a self-proclaimed Mahdi (the messianic leader who will restore justice and order to the Islamic faithful) who declared holy war on the Egyptian administration of the country. This uprising was increasingly popular and successful, and the initial reaction of the British government was to send Charles Gordon to the Sudan to evacuate the remaining Egyptian garrisons. Upon his arrival he declared that evacuation was impossible and instead requested reinforcements. The British government under Gladstone delayed in sending a major expedition up the Nile River to Khartoum, where Gordon was besieged by the Mahdi's forces. However, public pressure forced the dispatch of a relief force, which arrived at Khartoum two days after the fall of the city and the death of Gordon. With the Sudanese capital under the Mahdi's control, Egyptian and British forces evacuated the rest of the Sudan, while the failure to relieve Gordon was a significant factor in the fall of Gladstone's government in 1885.

► BATTLE OF OMDURMAN

The Battle of Omdurman (September 2, 1898) was the decisive engagement of the British conquest of Sudan. The battle was fought just north of the city along the Nile River. Kitchener's Anglo-Egyptian force was for most of the battle on the defensive against the numerically superior Mahdist army. The battle demonstrated the superiority of modern European weaponry, including machine guns and artillery, particularly in contrast to the muskets and spears used by the Mahdists. Although the Mahdists repeatedly charged the Anglo-Egyptian lines,

the superior firepower of Kitchener's troops enabled them to withstand every attack and inflict horrific casualties. Having suffered more than 10,000 killed and many more wounded, the Mahdists eventually broke and retreated, allowing Kitchener to occupy Omdurman and later Khartoum. In contrast, the Anglo-Egyptian force suffered only 51 casualties. The battle also included one of the last large-scale cavalry charges of the British army.

—*Wesley Ferris*

The Mahdi died on June 22, 1885, and was succeeded by Abdullah, known as the Khalifa. The Mahdist regime, as it was known, ruled Sudan for the next 13 years and instituted strict Islamic rule. Mahdist and Egyptian forces skirmished on the Egyptian-Sudanese frontier in the late 1880s and early 1890s, but no serious effort was made by either side to invade the other. However, the British government increasingly came to fear that other European powers might attempt to secure control over the Sudan in Britain's absence. The appointment of Herbert Kitchener as sirdar, or commander in chief, of the Egyptian army in 1892 signaled a renewed determination to defeat the Mahdists, avenge the death of Gordon, and regain control of the Sudan.

The British invasion of the Sudan began in 1896 with the occupation of Dongola. In the advance up the Nile toward Khartoum, logistics and supply were as important as battles, and the construction of railways across significant stretches of desert allowed Kitchener to maintain supplies to his Anglo-Egyptian force. The invasion of the Sudan culminated at the Battle of Omdurman, just to the north of Khartoum, on September 2, 1898, and resulted in a decisive British victory. Khartoum was reoccupied, and the last of the Mahdist forces were defeated by the end of 1899. The Mahdist regime had coincided with periods of drought and famine and had ruthlessly persecuted adherents of other faiths, so the British were generally welcomed after the defeat of the Mahdists. An Anglo-Egyptian agreement in 1899 formally restored Sudan to Egypt, but in practice the British ruled the country. The British reoccupation of the Sudan came just in time, as a small French force that had been sent to the Nile farther upriver at Fashoda to advance French claims to the region was forced to withdraw by Kitchener's much larger force.

The Boer War

The Boer War (also known as the Anglo-Boer War or the South African War) of 1899–1902 pitted the British Empire against the Boer people of southern Africa. The Boers, descendants of Dutch settlers, tried to defend the independence of their republics, the Transvaal and the Orange Free State, against British intrusion. The Boers won some initial military successes but were eventually worn down and forced to surrender after a bitter guerrilla war that is often seen as an example of twentieth-century total war.

At the end of the Napoleonic wars the Dutch colony at the southern tip of Africa, known as the Cape Colony, was taken by the British. To escape British rule the Dutch settlers, known as Boers, moved farther inland in the 1830s and established two independent republics, named the Orange Free State and the Transvaal. In 1880–1881 during the First Boer War, the Boers successfully maintained their independence against the British. However, the discovery of gold in the Transvaal in 1886 sparked an influx of British miners and settlers into the Boer republics. Again the Boers felt that their independence was being threatened.

Boer fears were realized in 1895 with the Jameson Raid, an inept small-scale raid by

► “THE FROG WHO TRIED TO BE AS BIG AS A BULL”

Political cartoons were used effectively for political attacks and protest in Europe from the time of the French Revolution. The British became especially adept at their use during the turmoil of the Industrial Revolution. Political cartoons became a permanent part of British magazines and newspapers after Punch’s display, “Cartoons,” appeared in 1843. The example here is a pro-British cartoon commenting on the Boer War by showing Paul Druger, president of the South African republics of Transvaal and the Orange Free State, as a frog. Nearby is British foreign secretary Joseph Chamberlain as a bull. By the second half of the century, the use of political cartoons had spread across Europe and into Asia.

British irregulars from South Africa on Boer territory. The raiders were all captured, and evidence suggests that they were sponsored by British authorities at some level. Powerful British interests in South Africa, including the South African prime minister and diamond merchant Cecil Rhodes (1853–1902), wanted control over Boer minerals. Tension continued to build over the next four years until the Boers sent an ultimatum demanding that the British cease all warlike preparations on their borders. When the ultimatum was ignored, the Boers declared war on October 11, 1899.

The Boer army initially numbered about 40,000 troops, mostly on horseback. They were highly mobile and were excellent sharpshooters. The Boers had rifles that used new smokeless powder and a few modern artillery guns. British forces numbered about 30,000, mostly poorly trained local militias. The Boers invaded the Cape Colony and the neighboring province of Natal and laid siege to the towns of Ladysmith, Kimberley, and Mafeking. British relief columns sent to raise the sieges were defeated in three disastrous battles (Stormberg, Magersfontein, and Colenso) during the Black Week of December 10–15, 1899. The Boers fought skilled defensive battles and made full use of their sharpshooting and mobility to humiliate the British army.

Despite early successes, the Boers were unable to follow up. None of the besieged towns was ever captured. Black Week inspired the British to shake up their command and take the war seriously. Massive numbers of troops and supplies were shipped to South Africa, and soon the British army numbered more than 200,000, commanded by Field Marshal Frederick Sleigh Roberts (1832–1914). The British took the offensive in early February 1900. Kimberley and Ladysmith were soon relieved (February 15 and 28, respectively). The Boer army suffered a major defeat at Paardeberg during February 18–27, 1900. Moving slowly over difficult parched terrain, the British occupied the Boer capitals of Bloemfontein in the Orange Free State in March and Pretoria in the Transvaal in June. The relief of Mafeking on May 17 after a 217-day siege prompted wild celebrations in Britain. Colonel Robert Baden Powell, who had led the defense of Mafeking, became a national hero and later founded the Scout movement based on his experience in South Africa.

Following the relief of Mafeking, Boer organized resistance appeared to be at an end, and Boer leaders fled into exile. Lord Roberts, assuming that his job was done, left for home. However, the Boers refused to give up and waged a guerrilla campaign until May 1902. This second phase of the war proved especially bitter. Boer

guerrillas, known as commandos, made use of their mobility to harass British garrisons and ambush British columns. The British tried to defend a huge territory, and the Boers could pick and choose their targets at will. The new British commander, Lord Kitchener (1850–1916), realized that the commandos were dependent on the Boer civilian population for food, supplies, rest, and medical care. He decided to separate the commandos from their support network by rounding up Boer civilians and placing them in what the British referred to as concentration camps, the unfortunate origin of that term.

The camps lacked clean water, food, and adequate medical care. An estimated 116,000 Boer civilians, of which 95,000 were women and children, were incarcerated in the camps. Perhaps 28,000 Boer civilians died of disease or starvation. The British initially refused to admit that there was a problem, instead blaming the Boer women for poor housekeeping and hygiene skills. The truth eventually leaked out, blackening Britain's reputation around the world.

In addition to the concentration camps, Kitchener covered the Boer countryside with blockhouses designed to obstruct Boer mobility. Boer farms and crops were burned, and livestock was slaughtered. On May 31, 1902, the exhausted Boers were forced to surrender and sign the Peace of Vereeniging. Casualty figures vary, but an estimated 7,792 British troops were killed in combat, with another 14,000 dying from wounds and disease. The Boers may have lost 6,000 killed in battle.

Black Africans also participated and suffered in the war. Blacks served in British forces, although their contribution to British victory was ignored when the war ended. Blacks also served in the Boer army, mainly in a support role. The British retaliated by imprisoning black families in separate concentration camps, where as many as 20,000 may have perished. As with the British, the Boers ignored the black contribution after the war ended.

The Boer War is often seen as an example of total war. It blurred the distinction between combatant and civilian, especially on the Boer side. Because Boer civilians contributed directly to the Boer war effort according to the British, they were therefore considered targets

of retaliation. The Boer rural economy was destroyed, and civilians imprisoned in concentration camps suffered terribly. The war was also marked in Britain by prowar propaganda campaigns. The British general election campaign of November 1900 is known as the Khaki election because of the dominance of war issues.

Barbary Wars

The Barbary Wars were two wars (1801–1805 and 1815) fought between the United States and the North African states in the early 1800s. Americans traded extensively in the Mediterranean before the War of Independence from Britain, but following that war the British Royal Navy no longer protected American shipping in the Mediterranean, and consequently American ships soon fell prey to the four Barbary states of North Africa: Morocco, Algiers, Tunis, and Tripoli. These states were soon seizing U.S. merchant ships and holding their crews for ransom. As early as 1786, U.S. minister to Paris Thomas Jefferson suggested that diplomacy and payment of tribute would be unsuccessful and that the only real course for the United States was to build a navy.

Late in 1793 a truce between Portugal and Algiers mandated the release of Algerian warships into the Atlantic, where they took a dozen American merchant ships. As a consequence, in March 1794 Congress authorized building six frigates: the 44-gun *United States*, *Constitution*, *President*, and *Chesapeake* and the 36-gun *Constellation* and *Congress*. These were the

first ships of the U.S. Navy. Work on them was to stop if a treaty could be concluded. This was accomplished in September 1795, and in March 1796 the Senate approved the treaty. The United States agreed to pay \$525,000 to ransom 100 prisoners. In addition, the United States agreed to provide Algiers an annual gift of naval stores worth over \$21,000 and a completely equipped frigate, the *Crescent*, that was delivered to Algiers in February 1798.

This settlement led to demands from other North African states. Richard O'Brien, a captain captured in 1785, negotiated treaties with Tunis and Tripoli, paying Tunis \$107,000 and Tripoli some \$56,000 not to attack American ships.

In 1801 Yusuf Karamanli, the pasha of Tripoli, demanded a new treaty worth \$250,000, annual payments of \$20,000, and recognition of Tripoli's equality with Algiers. President Jefferson refused, and on May 14, 1801, Tripoli declared war on the United States. Jefferson ordered Captain Richard Dale to the Mediterranean with the frigates *President*, *Philadelphia*, and *Essex* and the schooner *Enterprise* to protect American merchant ships. On August 1, 1801, the *Enterprise* engaged in a long battle with the *Tripoli*, killing 50 of the 80 crewmen. No Americans were killed.

Captain Richard V. Morris replaced Dale, arriving at Gibraltar on May 25, 1802, in the *Chesapeake*. Morris remained in the Mediterranean until June 1803 convoying merchant ships and occasionally blockading Tripoli but doing little else. On June 17, 1802, Tripoli captured an American brig, which Richard O'Brien, American consul to Algiers, paid to release. Morris unsuccessfully attempted to land at Tripoli in February 1803 and made a futile attempt to negotiate in May. In June he was called home to answer for his lack of accomplishment.

Commodore Edward Preble on the *Constitution* arrived in August to take action against Tripoli. Preble planned to use the frigates *Constitution* and *Philadelphia* to keep Tripoli under constant blockade. On October 31, 1803, however, the *Philadelphia* ran aground near Tripoli, and Captain William Bainbridge and his 307 men were taken prisoner. Preble feared that Tripoli would then fit the *Philadelphia* for

service against his own squadron, but on February 16, 1804, Lieutenant Stephen Decatur and 74 men sailed into Tripoli Harbor on the *Intrepid*, a captured Tripolitan ketch; boarded the *Philadelphia*; and set it on fire. They then withdrew without losing a man.

Congress learned in March 1804 of the *Philadelphia's* capture and planned to send out an increased naval force. Preble did not wait. With a force of 1,000 men aboard the *Constitution*, 3 brigs, 3 schooners, and 6 gunboats and 2 bomb boats borrowed from Naples, he attacked Tripoli, which was protected by 25,000 men, 115 cannon, 19 gunboats, 2 galleys, 2 schooners, and 1 brig.

After failed attempts to negotiate, Preble launched five attacks, on August 3, 7, and 25 and September 3 and 4. He sank several gunboats, captured others, and bombarded Tripoli. Some 30 Americans died in the attacks, 13 of them in the premature explosion of the *Intrepid*, which was fitted as a fireship to destroy shipping in the harbor.

On September 10, 1804, Commodore Samuel Barron arrived with five frigates to relieve Preble, who sailed home. Barron's ill health and bad weather prevented further assaults. With Barron came William Eaton, who had a plan to install Yusuf's deposed older brother, Hamet, in power in Tripoli. Eaton, with two midshipmen and seven marines, located Hamet in Egyptian exile and signed a convention with him in February 1805. Eaton was named commander of the expeditionary force that departed Alexandria on March 6 and consisted of 10 Americans, 300 Arab horsemen, and 1,000 camels. The force marched 500 miles across the Libyan Desert to Derna, assaulting that city on April 27 with artillery support from the American brigs *Argus*, *Hornet*, and *Nautilus* under Captain Isaac Hull. Hamet and Eaton then took control of the town, and marine captain Presley O'Bannon raised the American flag for the first time over a conquered foreign city. Tripolitan forces failed in two attempts to retake the city on May 8 and June 10.

Meanwhile, on June 10 Yusuf agreed to peace. He accepted a \$60,000 ransom for the release of the American prisoners but renounced tribute from the United States. The

Constellation then evacuated Eaton and the other Americans as well as Hamet Karamanli, to whom the United States paid a small annual stipend, although his brother later installed him as governor of Derna.

Algiers captured five American ships between 1807 and 1815, but the 1808 American embargo and the war with England prevented American retaliation. In March 1815 Congress declared war on Algiers, and President James Madison sent two squadrons to the Mediterranean. Decatur reached Algiers in the *Constellation* on June 28, 1815, with two captured Algerian warships. Algiers then released its American prisoners, renounced tribute from the United States, and agreed not to attack American merchant vessels. Decatur continued on to Tunis and Tripoli, which reaffirmed their peaceful intentions. He then sailed from Tripoli on August 9, 1815,

having secured safe passage for American trade in the Mediterranean.

■ Introduction: War and Warfare in South, Central and Southwest Asia

During the eighteenth and nineteenth centuries India became a British colony, Crimea and the Caucasus came under Russian rule, the Ottoman and Persian empires lost territory and prestige, and much of central Asia became part of the Chinese or Russian empires. Many factors contributed to these developments, but the most important was warfare.

This certainly was the case with central Asia, a region stretching from the Caspian Sea in the west to the Gobi Desert in the east and from Siberia in the north to Persia and Afghanistan in the south. A land of arid grasslands, deserts, and few cities, central Asia's migrations and conquests and the economic activities of its peoples, mainly Turkic-speaking nomads, had played key roles in the history of Eurasia for many centuries. The political fortunes and the importance of the region began to decline in the 1400s and 1500s, however, as a result of the region's political disunity following the breakup of the Mongol empire in the thirteenth and fourteenth centuries,

the declining economic importance of the Silk Road after an ocean route was opened between East Asia and Europe, and, most importantly, the spread of gunpowder weapons, which shifted the military advantage away from steppe horsemen to settled peoples with the capacity to manufacture the new weapons and maintain larger armies in the field.

This decline culminated in the events of the 1700s and 1800s, when the steppe peoples of central Asia lost their political independence to Eurasia's two largest empires, China and Russia, and in a much more limited way to Great Britain. In a series of conquests during the reigns of three emperors—Kangxi (1661–1722), Yungzheng (1722–1735), and Qianlong (1735–1796)—Chinese armies conquered the Mongol and Turkic peoples of eastern central Asia and incorporated them into the Qing empire. A century later, as its prospects for further expansion at the expense of Persia and the Ottoman empire dimmed, Russia turned its attention to the western and middle

portions of central Asia, which it brought under its control between the 1860s and 1880s. The only political entity in the region to retain a measure of independence was Afghanistan, which was more an aggregation of fiercely independent tribes than a true state. The Afghans held their own in two wars with the British, but at the conclusion of the Second Anglo-Afghan War (1878–1880) the Afghans were forced to accept British direction of their foreign policy.

In South Asia the key event between 1750 and 1860 was the British conquest of India. In the mid-eighteenth century merchants of the British East India Company carried on their business from a few fortified coastal enclaves while carefully avoiding political entanglements. A little over a century later the British dominated the subcontinent with an Indian army of 250,000 men, which they used to sustain their power in India itself and extend it in other parts of the world. This was achieved through dozens of wars that the British fought against the French, the Mughul empire, and numerous Indian regional powers, including Bengal, Oudh, Mysore, the Maratha Confederacy, and the Sikh kingdom of Punjab. The British also fought a war against rebellious army units and their supporters in the Indian Rebellion of 1857–1858.

In explaining the British success, military historians long ago abandoned the nineteenth-century theory that the superior fighting quality of British troops was the deciding factor. Most of these historians also are skeptical of the argument that better-quality British technology was the key. Many Indian rulers employed European military experts who provided advice about the manufacture and use of firearms, cannon, and artillery that were on par with those of the British. British superiority in weaponry was established only from the mid-1850s onward, by which time most of the continent had been subdued. Recent accounts tend to offer two other explanations for the British success. First, the British had much greater financial resources than those of their Indian opponents as a result of the taxes they collected from their Indian subjects and the capital they could raise from Indian financiers. Such resources provided funds to win allies through bribes, hire and train large

numbers of native troops to fight for them, and keep their armies in the field until victory was achieved. The British also benefited from the fact that their opponents often were politically fragmented and lacking allies. A prime example is the conflict with the Maratha Confederacy, whose troops matched those of the British on the battlefield but whose overall effort was damaged by a lack of coordination among armies representing the confederacy's various parts.

With the British victory in the Sikh Wars (1845–1846, 1849–1850) and the suppression of the Indian Rebellion in 1857, the military history of India shifts from being a story of conquest and more or less continual war to one of consolidation and relative peace in India itself. The British merged the armies of the Bengal, Madras, and Bombay presidencies into a centrally controlled Indian army, which in 1900 consisted of approximately 157,000 native troops and 74,000 English. During World War I the Indian army expanded to over one million troops, 100,000 of whom were killed or wounded in the fighting.

In contrast to India, the military challenge facing the Ottoman and Persian empires was to halt territorial losses on their peripheries and suppress internal rebellions. For the Ottoman empire the Treaty of Karlowitz (1699), which ended a war with European powers dating back to 1683, set a pattern of military defeat and territorial losses that continued in the eighteenth-century wars against Austria and Russia. Over a century the empire lost control of Hungary, the Dalmatian coast, parts of Crimea, and present-day Ukraine. Persia lost control of its eastern provinces to the new Afghan state in the mid-1700s and ceded its territories in the Caucasus to Russia after defeats in the Russo-Persian wars of 1804–1813 and 1826–1828. In both states these defeats generated efforts to reform their armies.

In the Ottoman empire Selim III (r. 1789–1807) established colleges to teach European military sciences, issued new regulations for the artillery and transportation units, and hired European officers to advise the Ottoman army and train a special new unit known as the “new order army.” Conservatives blocked these reforms when they forced Selim to resign in 1807 and then murdered him in 1808, but beginning in the

1820s upgrading the army again became a priority under Mahmud II (1808–1839) and his successors. Progress was made on many fronts, but the Ottomans still needed Russian help to repulse an Egyptian invasion of Syria in 1832–1833 and Anglo-French help in the Second Turko-Egyptian War (1839–1841), when Ottoman efforts to win back territories from the Egyptians led to a series of early disasters. Thanks to their British and French allies, the Ottomans were on the winning side in the Crimean War but were badly beaten in the Ottoman-Russian war of 1877–1878. The postwar treaties resulted in the independence of Serbia, Romania, and Bulgaria, a status gained by Albania after the Ottomans lost yet another war in 1912–1913 to a coalition of Serbia, Greece, Romania, and Bulgaria. Despite its record of military futility, the Ottoman empire was recruited as an ally by the Germans in World War I. This time, military defeat led to more than territorial losses. It led to the Ottoman empire's demise.

Military reform in Persia had a similarly unsatisfactory result. In the 1820s Crown Prince Abbas Mirza created a “new army” trained by European officers and equipped with updated firearms and artillery. He used these troops effectively in suppressing rebellions in eastern Persia before his death in 1833, but when Persia sought to recapture territories in Afghanistan in 1836–1838 and 1856–1858, the new army performed poorly, and Persia was beaten in both instances. Faced with debts, mediocre leadership, Russian and British meddling, and a backward economy, the Persian government made military reforms a low priority for the rest of the century. The army became a laughingstock and was one of the many reasons why in the early 1900s the country descended into the chaos of revolution, civil war, and unchecked foreign intervention.

—James H. Overfield

Indian Armies under Colonial Rule

The Indian Army was formed in 1748 by the East India Company (EIC) and consisted of mostly Indian troops led by a European officer and a noncommissioned officer corps. The force was raised to support the company against native

principalities that were at war with each other or that were opposed to the EIC itself. The Indian Army was used by Robert Clive, the EIC's chief military officer, to eliminate French competition to the EIC in India during the Seven Years' War, including the French ally in Bengal, Siraj Ud Daulah, at the Battle of Plassey in 1757. The battle is considered the point when the company became a major force on the subcontinent.

Three regional armies were raised by the respective presidencies in areas of regional control created to aid in the administration of the territories controlled by the EIC. These were located in Bengal, Bombay (present-day Mumbai), and Madras, but they were under the orders of the commander in chief, who was superseded in authority only by the governor-general (created by parliamentary act in 1773) in India. The composition of the force gradually changed throughout the nineteenth century, with more natives assuming noncommissioned officer positions. The rank-and-file soldiers were almost exclusively Indian or Afghani, although poor Irish and English soldiers occasionally enlisted. The organization was broken into the usual divisions of infantry, cavalry, artillery, and support regiments.

The Indian army saw constant action in skirmishes throughout the eighteenth century and was the main force in major combat in

Sikh officers and soldiers of the British Fifteenth Punjab Infantry regiment, shortly after the Indian Rebellion (also known as the Indian Mutiny), 1858. (Felice Beato/Hulton Archive/Getty Images)

ARMIES OF THE NATIVE PRINCES

The Indian Army was not the only armed force on the subcontinent. British control of India was never truly complete, and native princes held almost a third of the area of India in political entities that could be as small as a few square miles or as large as the vast areas of Hyderabad or Kashmir, both larger than England. The largest states held nominal administrative and legislative sovereignty as well as their own armies. These armies were still ostensibly loyal only to their rulers, and even after 1895 when their forces were made Imperial Service Troops and adjunct to the main Indian Army, they were commanded by their respective rulers.

—Scott Rhymer

Afghanistan (1842) and two campaigns against the Sikhs between 1845 and 1849. The Indian Rebellion (1857–1858), in which troops throughout the Bengal Army rebelled against the British occupation, marked the end of the company-run Indian Army. The troops mutinied over a number of issues, from racial and religious tensions between native and white troops to personal and national aspirations of the Indian gentry. Following the mutiny, India was administered as a crown colony directly from London. The army was reformed along the regimental system of the British Army, which was based on the system used in the counties of Britain, but this could not be well replicated. Instead, many of the Indian units were based on the ethnicity or religious affiliation of the natives. The size of the Indian Army was usually somewhere around a quarter of a million men under arms.

Indians joined the army for various reasons, but patriotism was rarely among them. These soldiers were paid well and received pensions and death benefits, providing the troops and their families more stability than was typically possible in civilian life. Discipline, while strict during the nineteenth century, was more lenient for native troops than for those from Great Britain. British troops could be flogged until army reforms of the 1870s, but this was not an option when dealing with the natives, mostly for fear of creating enmity toward the British officers.

Natives were excluded from the officer corps until the first decades of the twentieth century, with the first Indian officers being doctors.

—Scott Rhymer

Ottoman Military Reforms in the Reigns of Selim III and Mahmud II

Selim III (r. 1789–1807) and Mahmud II (r. 1808–1839) launched reforms of the Ottoman military in the late eighteenth and early nineteenth centuries after a century of halfhearted reform efforts. The impetus for the reforms was the poor performance of the Ottoman military in wars against the Austrian Habsburgs and Russians in the late 1700s. Neither ruler reached his goal of creating a modern military, but their limited successes helped revitalize the empire and gave later reformers a foundation on which to build.

Selim sought reforms in three areas. First, he sought to reorganize and reequip the established army corps, including the famed Janissary corps, once the elite infantry fighters of the Ottoman army but by the eighteenth century consisting of poorly trained and unmotivated soldiers mainly devoted to protecting their privileges. Second, he established the Nizam-ı Cedid (New Regiment or New Order), around which a modern European-style military could be created. Initially, this new unit consisted of Russian- and German-speaking deserters and prisoners during the Ottoman-Habsburg-Russian War (1787–1791), who were turned into a company-size infantry unit and armed with captured weapons. After the war, this unit was stationed out of public view and was reinforced with recruits from the urban unemployed. The British embassy provided some weapons and equipment, and several French soldiers of fortune were hired as trainers and advisors. Soon additional foreign experts and weapons were introduced. The third part of Selim's plan was the establishment of the first modern military

school of the empire in 1795, the Imperial Military Engineering School.

The Nizam corps quickly grew, with the first regiment established in 1795 and the second one in 1799. Despite their effective performance in the Ottoman-French War of 1798–1802, the Nizam troops were bitterly opposed by established Janissary units, who saw the new corps as a threat to their many privileges, and by some members of the Islamic clergy, who were against the use of non-Muslim European advisors and any reform inspired by foreigners. Their case was strengthened when several of the provincial Nizam regiments performed poorly in the opening stages of the Russo-Turkish War (1806–1812). In May 1807 a small disorder within the guards of the Istanbul straits defenses turned into a full-scale rebellion against Selim, who sought to appease the rebels by executing a number of reformist officials and some of his close friends. This simply encouraged the rebels, who massacred Nizam soldiers and forced Selim to abdicate in favor of his cousin, Mustafa IV. In 1808 Mustafa himself was overthrown and replaced by his younger brother, Mahmud II.

Like Selim, Mahmud was convinced of the need for military reform, but after the Janissary rebellions of 1807 and 1808, he bided his time, gaining allies and purging conservative officials in preparation for a strike against the Janissaries. This came in 1826, when the Janissaries rebelled after Mahmud announced plans to reorganize the corps. With the support of loyal Janissary officers, elements of the regular army, and some Islamic leaders, Mahmud acted aggressively against the rebels on June 15, 1826. During this so-called *Vaka-i Hayriyye* (Auspicious Event), hundreds of Janissaries were killed. Two days later Mahmud disbanded the Janissary corps and its allied and affiliated corps.

Mahmud was now confident that his goal of founding a modern military was within reach, but he had no concrete ideas and no able advisors. Consequently, he was compelled to follow the blueprints of the defunct Nizam project of Selim III. The decree ordering the establishment of the new military, the *Asakir-i Mansure-i Muhammediye* (Victorious Soldiers of the Prophet Muhammad), was a slightly altered copy of the old Nizam regulations. Mahmud managed to

raise three new regiments, now known as *Mansure* regiments, but the lack of expertise among officers made it difficult to teach the soldiers even rudimentary military skills. The reform initiative reached a turning point with the appointment of Mehmed Hüsrev Pasha as the commander in chief of Mansure troops in May 1827. Hüsrev created a private staff of foreign experts, translators, and other personnel, which gradually became the model for an official military staff for the commander in chief.

The Ottoman-Russian War of 1828–1829 caught the empire in the first stages of overhauling its military system, so there were only 2 combat-ready elite regiments and 33 poorly trained regular regiments. Mahmud decided to use the elite regiments for the defense of Istanbul, so he had no choice but to recruit as many volunteers, mercenaries, and tribal warriors as he could. Even though this makeshift army inflicted serious casualties and mounted a stiff defense for a year, it was unable to resist the Russians, who reached Edirne city, the very heart of the empire, on August 19, 1829. Another setback followed in 1831, when the Egyptian ruler Muhammad Ali rebelled against his Ottoman overlord by invading the Ottoman province of Syria and pushing into Anatolia, where his army defeated the Ottomans on December 21, 1832. Mahmud had no choice but to seek help from his archenemy, Russia. The arrival of Russian troops as well as British diplomatic intervention stopped the Egyptian advance, but the Ottomans were forced to cede Syria to Muhammad Ali.

With the empire near collapse, Mahmud introduced yet another set of proposals for military reform. Its centerpiece was the establishment of an educational institution for the training of future officers according to European models. Mahmud and his commanders were aware of the superior performance of Muhammad Ali's army but were especially impressed by the performance of its officers. This led to the foundation of the Turkish Military Academy in 1834, which became the most enduring of Mahmud's military reforms and a turning point in the history of Ottoman modernization. However, the effects of the new academy were not felt immediately. The Ottoman army suffered another humiliating defeat against the Egyptian army on June 29, 1839,

before the first academically trained officers were commissioned. Mahmud died two days later without learning of the defeat.

Anglo-French Wars in South Asia

The Anglo-French Wars in South Asia, also known as the Carnatic Wars because much of the fighting took place in the Carnatic region of southeastern India, took place in 1744–1748, 1749–1754, and 1756–1763. They were part of the long-standing struggle between France and Great Britain for colonial possessions and worldwide commercial dominance, a struggle that in India mainly was carried on by the French and English East India companies. As a result of the wars, Great Britain became the paramount European power in South Asia.

By the 1740s, the cooperation that had marked earlier European commercial activity in India had given way to the tensions of commercial, political, and personal rivalries, as the French made dramatic inroads into British political influence and profits, especially after the appointment of Joseph François Dupleix as superintendent of French affairs in Chandernagore in 1730 and governor-general of Pondicherry in 1742. The rivalry had reached the point that when the War of the Austrian Succession broke out in Europe in 1740, it was assumed that England and France would be on opposite sides and that the conflict would spread to India and the Indian Ocean. As it turned out, however, war between the two states was not declared until 1744, the year in which the first Carnatic War began.

The first major encounter of the war took place in July 1745, when the British dispatched four ships to Pondicherry, the city on the Coromandel Coast that was the center of French political and commercial power in India, to attack

French merchant ships. In response, Dupleix called for help from the French Indian Ocean naval fleet under the command of Mahé de La Bourdonnais. After arriving off the Coromandel Coast in July 1746, La Bourdonnais met the British in a bloody but indecisive battle off the coast of Nagapattinam and in September captured Madras, the major center of British commercial activity in India. Although the admiral favored returning Madras to the British in return for a large ransom, Dupleix recommended maintaining control of the city as a way of extending French political power and crippling British commercial activity. Dupleix prevailed, and in November La Bourdonnais returned to his fleet headquarters in the Indian Ocean after storms destroyed two of his largest ships.

Also in November, Anwarrudin, the nawab (native governor) of Arcot, who claimed authority over Madras, with British encouragement sought to expel the French with an attack of his 10,000-man army. A small French garrison defeated the nawab's forces, and Madras remained under French control until 1749. Indecisive fighting continued in 1748, when the French failed to take Fort St. David, located 100 miles south of Madras in Cuddalore, and the British siege failed to take Pondicherry. The War of the Austrian Succession, as well as the First Carnatic War, ended in the fall of 1748. Under the terms of the Treaty of Aix-la-Chapelle, the French returned Madras to the British in return for the return of Louisburg (in present-day Nova Scotia), the major French fort in North America that had been taken by the British in 1745. In effect, the treaty maintained the status quo ante in India.

Although Aix-la-Chapelle brought peace to Europe, conflict between the French and British trading companies in India resumed in late 1749, when they backed rival claimants in succession disputes over the thrones of the *nizam* (provincial governor) at Hyderabad and the nawab of the Carnatic. In this, the Second Carnatic War (1749–1754), the French under Dupleix had the original advantage, when in 1750 their allies made good their claims to rule in both states. At this point, however, Robert Clive, the 25-year-old East India Company official and captain in the company's army, emerged as a formidable opponent of the French. He was able to undermine

French success in particular at Arcot, where he overthrew Chanda Sahib, the French-supported nawab, in September 1751 and replaced him with the British ally, Muhammad Ali Walajah. Clive's relief of Arcot and subsequent military expeditions in support of the newly installed nawab accounted for the increased respect and admiration of his military skills and leadership. This led to his appointment as governor of Fort St. David in 1755 and Calcutta in 1757.

Meanwhile, Dupleix received grants of land and titles from his client Muzaffar Jang, the nizam of Hyderabad. The expansion of French commercial and revenue rights in the northern Circars, on the Coromandel Coast, and the interior areas of the southern Deccan appeared to solidify the company's place in India. But Dupleix was unable to take advantage of his newly won territories, a result of failed military alliances, especially that with Chanda Sahib at Arcot, and massive indebtedness to native rulers and moneylenders. In 1753 the French government, in a move endorsed by the directors of the French East India Company, recalled Dupleix as governor-general, replacing him with Charles Godeheu upon his arrival at Pondicherry in August 1754. A treaty of peace recognizing the British-allied Muhammed Ali Khan as nawab of Arcot followed soon thereafter. This second "peace" marked the beginning of the end of Dupleix's dreams to establish and expand the French empire in India. However, whereas Dupleix failed in his endeavor to establish a profitable method to extract revenue from his native allies and to elicit support from Paris for his plans to secure French power in India, the British East India Company utilized a similar scheme of revenue farming but with crucial support from home, to its benefit.

The British East India Company faced significant turmoil in the 1750s, however. The British, fearing a French assault on Calcutta, had begun fortifying the town in violation of its treaty with Siraj ud-Daula, the nawab of Bengal, and ignored his entreaties to discontinue expanding the fortifications. On June 20, 1756, Siraj ud-Daula's forces seized Calcutta and Fort William. On that same night, ud-Daula's troops imprisoned several dozen company servants and natives in a small prison adjacent to an army barracks. In

what came to be known as the infamous Black Hole of Calcutta, some 40 people may have died of thirst and heat exhaustion. In response, Clive was dispatched to Calcutta from Madras with a force of European troops and sepoys who restored the company at Calcutta by January 1757. Clive's forces then seized the French fort at Chandernagore (Bengal) in March 1757. In June of that year, the British defeated and killed Siraj ud-Daula at the Battle of Plassey. The terms of the peace treaty provided the British East India Company with revenue collection rights to a large portion of the Bengal region (24 *parganas*, or districts) and laid the foundation for British colonial rule in India.

Meanwhile, the British declared war against France on March 15, 1756, in what became the Seven Years' War (1756-1763). In India, the first outbreak of the Third Carnatic War, aside from Clive's attack at Chandernagore, was the French seizure of Fort St. David in May 1758. Later that year the French, under the command of Lally, besieged Madras, which the British successfully defended. The British scored a decisive victory against the French at the Battle of Wandiwash (Vanavasi) in 1760. By 1761, the British had captured Pondicherry (1761) and most other French settlements in India.

When the Seven Years' War ended in 1763, the Treaty of Paris, signed on February 10, allowed a minor French presence in India at Pondicherry and Chandernagore, with the stipulation that France could not fortify them. The British, in contrast, were well positioned to succeed the Mughals as the dominant power on the Indian subcontinent.

Anglo-Mysore Wars

The Anglo-Mysore Wars were a series of four conflicts fought between 1767 and 1799 that involved the Mysore Kingdom of southwestern India and the British East India Company. The result was the establishment of British supremacy in the Deccan and southernmost regions of India.

The First Mysore War (1767–1769), however, hardly anticipated any such British triumph. The East India Company was concerned with the growing power of Haidar Ali, the ruler of Mysore, whose territories bordered the Carnatic coast and thus threatened British trading stations at Madras and Cuddalore. To counter this perceived threat, the British entered into an alliance with the Nizam of Hyderabad, who, however, soon reversed himself and joined forces with Haidar. The British won important victories in the first war, but agreed to end the war in April 1769, when Haidar's forces managed to lift the British siege of Bangalore and came within 5 miles (8 kilometers) of Madras. The resulting treaty called for the restitution of all conquests and the promise of mutual aid and alliance in any defensive war.

The failure of the British to come to Haidar's aid when Mysore was attacked by the Maratha Confederacy in 1771 drove Haidar into an alliance with the French, and when warfare broke out between Britain and France in 1778 over French support for the American revolutionaries, Haidar joined the conflict. The Second Mysore War (1780–1784) opened with Haidar's invasion of the Carnatic with 80,000 men and 100 guns. Taking Arcot, Haidar destroyed a British force at Pollilur (September 10, 1780), forcing his enemies to flee to Madras. Despite this initial success, Haidar was unable to capture Madras before Eyre Coote arrived with a relieving force from Calcutta. In 1781 the British defeated the Mysore

forces at the battles of Porto Novo (July 1), Pollilur (August 27), and Sholingur (September 28), but victory proved elusive. Haidar's son, Tipu, defeated the British at Annagudi (February 17–18, 1782), and a French squadron under Admiral Pierre du Suffren captured Trincomalee (August 30, 1782). The Treaty of Versailles (January 20, 1783) ended the war between Britain and France (and the United States), and Haidar Ali himself had died late in 1782. It was therefore hardly surprising that his son Tipu was amenable to peace, especially as the Treaty of Mangalore (March 11, 1784) restored the pre-war status quo.

Following the war, Tipu strengthened and modernized his army and continued to maintain close ties with the French, despite misgivings about their failure to give adequate support in the war between 1780 and 1784. The British under Governor-General Cornwallis countered the Mysore threat by entering into alliances with the Marathas, Hyderabad, and a number of other Indian states. When Tipu attacked one of these allies, the rajah of Travancore in late 1789, the Third Anglo-Mysore War (1790–1792) began. The war opened with General Sir William Medows invading Malabar with some 30,000 men. After Tipu successfully avoided Medows's forces, Cornwallis himself assumed command in January 1791, while Maratha forces attacked on Tipu's northern frontier. Losing his capital of Mangalore to the British (March 21, 1791), Tipu fell back on Seringapatam. After Cornwallis captured the citadel of Seringapatam, following a protracted siege, Tipu was forced to accept the Treaty of Seringapatam (March 16, 1792), in which he ceded half his territory to the British.

Despite this defeat, Tipu's abilities as an administrator ensured a quick recovery of Mysore. The continued threat from Mysore seemed all the greater to the British when Napoleon invaded Egypt in 1798. Fearing a French invasion of India in support of Tipu, Richard Wellesley, Lord Mornington, governor of India, ordered a force of 42,000 to invade Mysore (February 14, 1799). Tipu lost decisively, partly as a result of the defection of his three senior generals. Defeated at Siddeswara (March 5) and again at Malavalli (March 25), Tipu fell back on Seringapatam. There, having refused the exorbitant demands of General George Harris, Tipu died

defending his citadel from the final British assault (May 4). With Tipu's death, Mysore's territory was distributed to Britain's Indian allies, but the British maintained control over Mysore itself, thus ensuring its dominion in southern India.

Maratha Wars

The Maratha Wars were three wars of the late eighteenth and early nineteenth centuries (1775-1782, 1803-1805, 1817-1818) occasioned by the encroachment of the East India Company against the territory and authority of the Maratha Confederacy of south-central India. The result was the destruction of the confederacy and the establishment of British rule over most of the subcontinent.

The Maratha kingdom emerged in the mid-seventeenth century during the reign of Shivaji (1630-1680), with the fortified citadel of Raigad as its capital. The kingdom reached its peak in the 1750s, when it controlled much of northern and central India. But in the wake of defeat by the Afghans at the Third Battle of Panipat in 1761, expansion ceased, and the peshwa (hereditary ruler) of the empire lost power. The empire became a loosely governed confederation dominated by five Maratha dynasties.

In the First Maratha War, the East India Company involved itself in a succession crisis of the Maratha leadership yet was defeated at the Battle of Telagaon in January 1779 and forced to sign a treaty relinquishing all territory and revenue it had taken from the Maratha since 1775. The governor-general of Bengal, Warren Hastings, rejected the treaty and renewed its campaign in 1780 with a larger force. Despite their successes, in 1782 the British accepted the Treaty of Salbai. The Marathas regained control of territories conquered by the British in return for joining the

British in their war with the Mysore kingdom in the Second Anglo-Mysore War and prohibiting French settlements in their territory.

Renewed conflict within the confederacy 20 years later again tempted British intervention, initially in the form of the Treaty of Bassein in which the company agreed to support the peshwa Baji Rao II against his rival Jaswant Rao Holkar by stationing company troops on his domain in return for revenue-yielding authority within the territory. Three Maratha clans, however, promptly raised forces to eject the British, so on August 7, 1803, the company declared war and deployed two armies—one under General Gerard Lake, the other under Major-General Arthur Wellesley, later the Duke of Wellington—and inflicted a series of defeats on the Maratha, the most important at Assaye and Laswari. Ultimately the Maratha forces were chased into the Punjab, and the Treaty of Sarji Anjangaon, dictated at bayonet point, ceded additional territory between the Jumma and Ganges rivers to the company.

In the Third Maratha War the company was prompted by raids by freelance Pindari horsemen into company territory—horsemen the Marathas were by treaty obliged to restrain yet often indulged or encouraged—as reason enough to eliminate what remained of Maratha power. The company fielded an army of more than 20,000 men to mop up the Pindaris before bringing the Maratha to battle for a final defeat at Mahidpur in December 1817. The war dragged on into April 1818, but at the end of it the company was in possession of all of Baji Rao's territory.

Sikh Wars (1845–1846, 1848–1849)

The Sikh Wars were two short but brutal wars waged by British forces against the army of the Sikh-dominated state of Punjab, which under Ranjit Singh (r. 1801–1839) built a large well-equipped army with the help of European advisors. It was the last large Indian state not under British control, and when it fell after the Second Sikh War, British control of the subcontinent was complete.

The First Sikh War followed hot on the East India Company's failed effort in Afghanistan between 1838 and 1842. The British presence in Afghanistan and annexation of Sind in 1843 provoked first apprehension and then a preemptive response from the Sikh court in Lahore, which quite rightly feared a British attack. A force estimated between 12,000 and 20,000 men crossed the Sutlej River into British India on December 11, 1845, and seized Ferozepore two days later. When it pressed its offensive further southward, it was met and defeated by an Anglo-Indian force of 10,000 under General Sir Hugh Gough at Mudki. Gough's army then attacked and captured in bitter fighting Sikh entrenchments at Ferozeshah, after which the Punjabi army withdrew across the Sutlej. When in January 1846 the Sikhs again crossed the frontier, the British forces were ready. They won victories at Ludhiana and Aliwal before capturing the village of Sobraon near Lahore. Hostilities ended with a treaty signed at the Sikh capital on March 11, 1846, whereupon the Punjab became a British protectorate and the Sikhs were forced to pay an indemnity of £1.5 million. The overwhelmingly Muslim province of Kashmir was given to Gulab Singh, a Hindu chief who had deserted his Sikh allies and joined the British side before the Battle of Sobraon.

The second war was the product of the conviction on the part of Punjabi army that it had never been truly defeated and the ambition on the part of Lord Dalhousie, the new governor-general of India, to annex the Punjab outright. Both sides, in other words, were hankering for a return bout when the killing of two British officers at Lahore provided Dalhousie with appropriate outrage to invade the Punjab protectorate.

After a bloody but indecisive engagement at Chilianwala in January 1849—the battle cost 2,300 British casualties and prompted a call to replace Gough as commander-in-chief in India—the British force captured Multan and then shattered a combined Sikh-Afghan force of 50,000 with his artillery at Gujarat. Gough, who thereby concluded the war and made himself a hero before he could be fired, described Gujarat as “a victory, not over my enemies, but over my country.” The Punjab was annexed on March 30.

Anglo-Burmese Wars in the Nineteenth Century

The British and Burmese fought three wars during the nineteenth century, in 1824–1826, 1852–1853, and 1885. They were caused largely by territorial disputes, the British interest in promoting commerce, and Anglo-French rivalry. As a result of each of these conflicts, the Burmese increasingly ceded territory and sovereignty to the British. Burma (present-day Myanmar) was located to the immediate east of British India, bordering the states of Bengal and Assam. King Bagyidaw (r. 1819–1837) inherited and continued an expansionist policy as a result of which the Burmese had seized Tenasserim from Siam in 1766; subjugated the Kingdom of Arakan in 1784; conquered Manipur, near the Surma Valley, in 1819; and completed the invasion of Assam (which had begun in 1817) in 1823. After the conquest of Assam, Burma's western border touched on British India's eastern frontier, and the British feared that it could become a platform for an invasion of Bengal. As a result, the ill-defined border area between Burma and British India provided a constant source of friction.

THE BURMESE ARMY

The Burmese army evolved considerably during the Anglo-Burmese Wars. In 1824 the army consisted of only about 3,000 trained soldiers, mainly members of the royal palace guard. The army could be increased considerably on short notice by a royal order to provincial viceroys to provide a precise number of men at a designated location on a certain date. These conscripts, poorly trained and harshly disciplined, were usually issued either an old musket with ten rounds of ammunition or a sword, a spear, and an entrenching tool. These conscripts, numbering 10,000 to 20,000 or more in a conflict, preferred to attack rather than defend. Their tactics consisted of getting as near the objective as possible. While the musket men provided cover, the spear men dug a series of foxholes in a line. In the dark, the spear men would dig ever closer to the enemy objective until they got close enough to rush and overwhelm their adversary. During this operation, the musketeers would continue to fire on the enemy, and during the final assault they would charge with bayonets fixed. In defensive operations, the army

built strong teakwood stockades, frequently with walls up to 17 feet (5 meters) high and surrounded by deep ditches filled with sharpened bamboo stakes.

One significant feature of the Burmese military was its use of strong and sturdy war boats manned by marines. These boats were up to 100 feet (30 meters) long and 8 feet (2.4 meters) wide with a low draft and were made from the solid trunk of teak. They were manned by 50–60 oarsmen armed with swords and spears, and each boat carried a number of musket men. A small cannon was usually mounted on each vessel's bow. About 500 war boats were available on short notice, and these played a key role in a country laced with rivers.

The Burmese forces possessed more firearms during the Second Burma War, when their army was said to number 50,000. By the Third Burma War, Burmese soldiers were apparently less disciplined and motivated, and their army was only about 15,000 to 20,000 strong.

—Harold Raugh

One issue involved refugees. Thousands of Arakanese and later Assamese refugees abandoned their homes and fled to British India to escape Burmese enslavement. The Burmese considered the refugees to be their property and made a number of forays into British areas to find them. For their part, the British occasionally entered Burmese territory in pursuit of robbers.

The First Burmese War (1824–1826) was precipitated by a Burmese attack on a British military detachment on the Chittagong frontier in the fall of 1823 and the Burmese invasion of Cachar, an area under British protection, in 1824. The British declared war in March 1824. A British expeditionary force attacked and defeated Burmese forces at cities up the Irrawaddy River, including Rangoon and Kemmendine. During the summer monsoon period, a 60,000-man Burmese force surrounded the British at Rangoon, but in early December 1824, the British counterattacked and defeated the Burmese.

The British continued their advance northward and entered Prome on April 25, 1825, and

remained there during the summer. By September 1825, while negotiations were ostensibly being conducted, a Burmese army surrounded the British in Prome. In early December 1825, the British attacked and caught the Burmese off guard, then continued with their attacks to defeat Burmese units piecemeal. With victory in their grasp, the British continued their advance toward Ava, the Burmese capital. Under a flag of truce, Burmese envoys approached the British on December 27, 1825, to negotiate a peace treaty.

After the truce and a period of negotiations, however, it appeared the Burmese were preparing to continue the war. On January 18, 1826, the British renewed hostilities and followed the Burmese, who retreated toward Ava. After the British fought and routed a large Burmese force near Pagan on February 8, King Bagyidaw surrendered to prevent an attack on Ava. He agreed to pay an indemnity of £1 million, ceded Arakan and Tennasserim to the British, and renounced claims to Assam and other border regions. The Treaty of Yandabo was signed and concluded

the war in February 1826, and a reciprocal commercial treaty was signed in November.

Tension between the British and Burmese increased after Pagan Min became king of Burma in 1846. The Burmese ignored those parts of the 1826 treaty that guaranteed the protection of British merchants and commerce. Burmese officials were accused of harassing and overtaxing British merchants and unlawfully imprisoning two British mariners. The British sent a naval squadron under Commodore Lambert to Rangoon to investigate the situation. Lambert, however, went further when he seized the king's yacht and blockaded the Rangoon River. The British then provoked the Burmese to open fire on the blockading ships, and events spiraled out of control. The British issued an ultimatum to the Burmese king with terms that he could not possibly accept.

When the ultimatum expired, two British Indian Army brigades bombarded and captured Martaban and returned to Rangoon by April 8, 1852. After desultory operations, British reinforcements arrived at Rangoon in September 1852. British ships sailed upriver, bombarded the Burmese stockade at Prome, and occupied the deserted position in October. The British captured the town of Pegu the following month and then annexed the province of Pegu in January 1853. After overcoming continuing Burmese resistance in the region, the British marched on Ava. King Pagan was then deposed by his brother Mindon, who wanted to end the war. The British took advantage of the situation by demanding hundreds of additional square miles of land that included valuable teak forests. While no formal peace treaty was signed, a cease-fire ending the Second Burmese War was declared on June 30, 1853.

Burma was now effectively reduced to the area around Ava, and its foreign policy was basically determined until 1879 by a British resident. In 1879, however, the British agent was withdrawn in a diplomatic spat, and the Burmese sought closer ties with France. The Burmese sent a delegation to France in 1883 to observe French industry and possibly negotiate a commercial treaty. The British were wary that the French, who had fought and defeated the Chinese in 1884–1885 and had gained control of northern Vietnam, would also be supplying weapons to

the Burmese. These concerns were heightened when the French were given the contract to build a railway from Mandalay to the Indian frontier and establish a Burmese state bank.

In August 1885, the council of ministers in Mandalay levied a substantial fine on the British-owned Bombay-Burma Trading Company for allegedly exceeding their quota of teak logs and failing to pay for them. This was the excuse to go to war. The British issued an ultimatum in October 1885 demanding that Burma accept a British envoy and British control of Burmese foreign relations, among other items. Burmese king Thibaw rejected this ultimatum, so the British dispatched a three-brigade force that advanced on Ava before the Burmese had time to organize their defenses. Mandalay was occupied, and the Third Burma War (1885) was over in less than one month.

On January 1, 1886, the British formally annexed Upper Burma and proclaimed Burma a province of British India. Some Burmese soldiers who had fled into the jungle frequently became rebels or *dacoits* (bandits) and harassed the British and attacked their outposts. After four more years of fighting, the Burmese rebellion was suppressed in 1890.

Russian-Ottoman Wars of the Late Eighteenth Century, 1768–1792

The Russian-Ottoman wars of the late eighteenth century underlined the change in the balance of power in the Northern Caucasus and Crimea

regions. The Russian-Ottoman confrontation in 1768–1774 was largely caused by the ever accelerating expansion of Russian territory and influence in both the eastern and southern frontiers under Catherine II (r. 1762–1796). Following a series of clashes between Russian and Ottoman forces, Sultan Mustafa III declared war on Russia in September 1768. The declaration of war was triggered by a border incident in which a small contingent of Russian Cossacks entered the city of Basra in Ottoman territory and allegedly massacred civilians while searching for members of the Bar Confederation, a group in opposition to the Polish king, Stanislaus Augustus Poniatowski. In the ensuing conflict, the superiority of the Russian navy was clearly revealed. The Russian fleet was dispatched from the Baltic Sea around France and Spain to the Greek archipelago, where it dealt a devastating blow to the Ottoman fleet and destroyed virtually all of its seaborne communication installations at the Bay of Cheshme in July 1770. Ottoman forces and their Polish-Lithuanian allies were handily defeated under the command of Alexander Vasilyevich Suvorov, an instrumental figure during the 1787–1792 Russian-Ottoman war.

The Ottomans were constrained by a series of rebellions in the Arab provinces of Egypt and Syria in 1771. The unwelcome combination of domestic disarray and external defeat forced the Ottomans to capitulate and sign the Treaty of Küçük Kaynarca on July 20, 1774. Under the terms of this treaty, Russia formally gained direct access to the Black Sea through two key ports in the Crimean and Caucasus regions, the Ottoman empire was ordered to pay a hefty sum in war reparations (4.5 million rubles), and the Crimean Khanate was declared independent (which, in effect, brought it under the Russian sphere of influence).

The second major Russian-Ottoman war of the late eighteenth century resulted from ongoing conflict over Ottoman territories in Europe. The Ottomans were interested in winning back lands lost in the first Russo-Turkish War, while Catherine the Great of Russia, who had made a secret alliance with Emperor Joseph II of Austria in 1781, was interested in further conquests. The French, British, and Prussians gave encouragement to the prowar party in the sultan's court in Istanbul. With tensions rising, in

August 1787 the Russians declared war over alleged Ottoman violations of the Treaty of Küçük Kaynarca. The Ottomans responded by imprisoning the Russian ambassador, Yakov Bulgakov, but misread the extent of the Russo-Austrian alliance. Austria entered the war on the side of Catherine II almost immediately, and Austria's assistance proved invaluable, as the Ottomans were now constrained on multiple fronts. The Russians attempted to repeat the success of their naval operations, which had brought them victory during the 1768–1774 conflict, albeit this time without the explicit support of either the British or the French. However, Austria signed a separate peace with the Ottomans in 1791 in response to pressure from Prussia and concerns of the new emperor, Leopold I, over the possibility of revolution spreading to its territories in the Austrian Netherlands.

Neither Austria's departure nor the outbreak of war between Russia and Sweden affected the outcome of the war. Poor leadership and mutinous troops led to the Ottoman loss of Belgrade, Ismail, and Anapa. With the failure of an Ottoman effort to retake the city of Ochakiv, Selim III sought peace in December 1791 and signed the Treaty of Jassy in 1792. Under terms of the treaty, Yedisán was transferred to Russia, the Dniester became the official Russian-Ottoman frontier in Europe, and the annexation of the Crimean Khanate by Russia was formally recognized.

The two Russo-Turkish wars expanded Russian territory and set the stage for further conquests at the expense of the Ottomans in the 1800s. For the Ottomans, the wars affirmed the empire's military decline and helped inspire the military and administrative reforms sponsored by Selim III during the remainder of his reign.

Russo-Turkish War, 1877–1878

The fourth armed conflict between the Russians and the Turks in the nineteenth century, the Russo-Turkish War was a pivotal turning point in the history of the “Eastern Question” (the contest for control over former territories of the declining Ottoman empire). It resulted in independence for Serbia, Romania, and Montenegro. It also led to Austrian occupation of Bosnia and Russian dominance in Bulgaria.

After Turkish troops had ruthlessly suppressed revolts by Orthodox Christian subjects in Bosnia and Bulgaria in 1875–1876, Serbia and Montenegro declared war against Turkey. Although the Russian government stood aside, Russian military volunteers, including General Chernaiev, a Russian war hero from the central Asian campaigns, flocked to join Serbian forces to aid in the fight against the Turks. By 1876, these forces had failed miserably and the tsarist government stepped in diplomatically to preserve Serbian autonomy from Turkish repression. When the Turks proved resistant to administrative reforms proposed by Russia, Austria, and Germany, the tsarist government prepared for war. To gain Austrian acquiescence, Russia promised to allow Austrian occupation of Bosnia in return for Austrian recognition of a small Bulgaria under Russian protection. Austria pledged its neutrality in the event of a Russo-Turkish conflict by signing the Treaty of Budapest on January 15, 1877. By February 1877, Russian forces were massing for an offensive out of the south through Rumania. The Rumanians granted Russia permission to transit through their country on April 4, 1877, and they offered Rumanian troops to join in the fight. Russia rejected the offer of Rumanian military assistance, but did cross through Rumania after officially declaring war on Turkey on April 24.

The military campaigns were fought in two theaters, Bulgaria and the Caucasus, and lasted until the armistice on January 31, 1878. The Russians advanced to the Danube River on June 22, and the Turks began to retreat. The largest body of Turkish troops regrouped at the fortress of Plevna, which guarded the western approach to Sofia. At Plevna, Ottoman armies under the command of Osman Pasha and armed

with American-made repeater rifles and German steel artillery held off superior Russian numbers through two assaults and forced the Russians to look to Rumania for additional troops. In the Third Battle of Plevna in September 1877, combined Russian and Rumanian forces totaling 118,000 failed to take the fortress by storm, and the Russians abandoned the attack for siege operations. In December the Turks at Plevna finally surrendered, clearing the way for a Russian advance to the outskirts of Constantinople.

Afghan Wars (1838–1842, 1878–1880)

The Afghan Wars were two nineteenth-century conflicts occasioned by British fears of the threat posed by Russia to British interests in India and the Persian Gulf.

In the first the East India Company invaded Afghanistan to return to power the deposed emir, Shah Shuja-ul-Mulk (also known as Shuja Shah Durrani). A British army of 15,000 with 30,000 followers captured Kandahar without resistance and occupied Kabul in August 1839. British forces were unable to control the countryside, however, and this seemingly easy victory turned into a rout when, in 1841, the Afghans struck back and turned the British retreat into a massacre in which 4,500 troops and 12,000 civilians were killed by Afghan raiders and the bitter winter weather of January 1842. A punitive expedition returned to Afghanistan, defeated the Afghans in a series

of small engagements, and, in an act of retribution, burned the Great Bazaar in Kabul. Still, the initial purpose of the British campaign was thwarted when Dost Muhammad Khan, a self-proclaimed emir friendly to Russia, returned to power in Kabul shortly after the British army returned to India and reigned for 20 years.

In the Second Afghan War, British forces invaded after Tsar Alexander II annexed the Central Asian Khanates of Bukhara, Khiva and Samarkand to the Russian Empire, and Shere Ali, son and heir of Dost Muhammad, renewed the Afghan policy of friendliness toward Russia. The campaign began in November 1878 and quickly chalked a series of victories leading to the capture of Jalalabad and Kandahar early in 1879. Shere Ali died and was succeeded by his son, Yakub Khan, who signed a treaty ceding the Khyber Pass, Kurram, Pishin, and Sibi to Britain and agreed to receive a British agent in Kabul. The peace was shattered almost immediately, however, as the entire British mission was slaughtered by mutinous Afghan soldiers shortly after their arrival in Kabul. A punitive expedition led by General Frederick Roberts took Kabul, and some 100 Afghan deemed responsible for the massacre of the British mission were hanged.

In December 1879, Roberts then beat back an attack by a large Afghan force in the Battle of Sherpur. Abdur Rahman, grandson to Dost Muhammad, then led a new Afghan army equipped

with modern Russian rifles into northern Afghanistan. Rather than oppose him, the British offered him the throne. When a rival claimant to the throne, Ayub Khan, defeated a British army of 20,000 men in the Battle of Maiwand and forced a retreat to Kandahar, the settlement was imperiled until Roberts marched 10,000 men from Kabul to Kandahar—313 miles (504 kilometers) in 22 days—and defeated Ayub Khan in the Battle of Kandahar. When the victorious British withdrew to India, Ayub Khan seized Kandahar but this time was defeated by Abdur Rahman.

Afghanistan was now within Britain's sphere of influence in Central Asia, but the brutality of the fighting there helped to defeat the government of Disraeli in the British general election of 1880.

■ Introduction: War and Warfare in East and Southeast Asia

Eighteenth-century armies in East and Southeast Asia showed tremendous variation in size, weaponry, and organization. Not surprisingly, China's army, made up of 800,000 to 850,000 troops, was the largest and most successful. Despite setbacks in Vietnam and Burma, China's seizure of Xinjiang between 1756 and 1759 and its victory over the Gurkhas in Tibet in 1790 show the Chinese military's ability to sustain major campaigns over vast distances in enemy territory. Japan, a country with a strong military tradition, had many armies, the

largest of which was maintained by the Tokugawa shoguns, who since the early 1600s ruled Japan on behalf of the emperor. But each of Japan's 250 domains had its own army of samurai warriors, many of whom during the long period of Tokugawa peace had abandoned military training and fighting for careers as administrators. Smaller armies were maintained by Burma, Vietnam, and Thailand, and smaller armies still were maintained by the sultanates of the Malay Peninsula and the kingdoms of island Southeast Asia. China maintained a small navy,

but it was a pale version of the massive fleet assembled in the early Ming era or the 300-ship flotilla commanded by Admiral Shi Lang to take Taiwan in 1683.

In the nineteenth century these armies and navies, different in so many ways, did share one thing in common: the task of defending their country's territory and sovereignty from the aggression of Western imperialists. With the exceptions of Japan, which had breathing space at the end of the century to plan, equip, and train a powerful army and navy, and Thailand, which parlayed accommodation and clever diplomacy to maintain its independence, they all failed. Burma became a British colony after losing to the British the wars of 1823–1826, 1852–1853, and 1885–1886. Vietnam became a part of French Indochina after losing the wars of 1858–1862 and 1882–1884. Java, Aceh, and Bali all came under Dutch control after armed struggles. The people of the Philippines won their independence from Spain in 1898 but then immediately lost it after defeat in a war of independence against the United States between 1899 and 1902. China never lost its independence, but its defeats in the Opium War (1839–1842), the Arrow War (1856–1860), the Sino-French War (1884–1885), and the Sino-Japanese War (1894–1895) resulted in territorial losses, huge indemnity payments, the opening of the country to Western traders and missionaries, and profound humiliation.

The Western powers brought to these conflicts a number of advantages. For example, the Western powers had greater financial resources than their opponents did. At a time when fiscal constraints were making it difficult for the Chinese to maintain troop levels, weaponry, and training regimens, the British, Dutch, and French had the resources to hire and train native troops to do much of their fighting and keep armies in the field until victory was achieved. Western armies also benefited from the domestic rivalries and divisions faced by their opponents. In the First French-Vietnamese War, for example, the Vietnamese emperor surrendered in 1862 when he had to divert troops from the south, where he was fighting the French, to the north, where he faced a rebellion from a dynastic rival. Diponegoro, the leader of Javanese forces in the Java War against the Dutch,

capitulated in 1829 after two of his principal lieutenants crossed over to the enemy.

Western armies and navies also brought to these conflicts clear-cut technological advantages. Although even the smallest armies in the region had firearms and artillery, their weapons lacked the range, accuracy, and speed of fire of those used by Europeans and Americans. Because there was a great range of when and where they were manufactured, they also were difficult to repair. Steam-powered gunboats were first used effectively by the British against the Chinese in the Opium War (1839–1842), and subsequently naval power played an important role in the Anglo-Burmese wars and the French victory in the Sino-French War of 1884–1885.

The small kingdoms and sultanates of Southeast Asia had no chance of closing the technological gap between themselves and the Western armies they faced. They had essentially abandoned domestic gun and gunpowder manufacture in the eighteenth century, choosing instead to rely on imports from Europe. With little hope for victory in set-piece battles or the defense of cities, the Burmese, Vietnamese, Achenese, and Javanese were most successful in jungle guerrilla warfare, in which European rifles and artillery were less of an advantage. China and Japan, in contrast, both embarked on ambitious plans to match the West in terms of weaponry. China's efforts began in the early 1860s, when after its defeat in the Opium Wars and at the end of its struggle to end the Taiping Rebellion, it embarked on a program of self-strengthening in which it sought to draw on Western technology and science to build its military while preserving the traditional Confucian order. China purchased foreign ships and weapons, hired foreign advisers, and built arsenals and shipyards, but the effort was hindered by financial constraints, poor planning, foreign interference, and only sporadic support from the imperial court. Defeats by the French in the 1880s, the Japanese in the 1890s, and a coalition of Western powers in the early 1900s further undermined support for the Qing government, which was overthrown by revolution in 1911.

Meanwhile, China's smaller neighbor, Japan, pursued a different path toward military modernization. After the overthrow of the Tokugawa

shogunate in 1867, Japan's new leaders also purchased foreign weapons and drew on the expertise of foreign military advisers. But they went much further. They mandated wide-ranging social, political, educational, and economic reforms that provided the foundation for the support and maintenance of an army and navy that shocked the world with victories over China in 1895 and Russia in 1905.

—*James H. Overfield*

Chinese Military in the Late Qing Era, circa 1750–1820s

At the end of the eighteenth century, the Chinese military was comprised of a widely dispersed multiethnic army entering a period of declining effectiveness. The Chinese military, which had successfully expanded Qing territory and confronted external threats earlier in the century, had lost its ability to quell internal revolts and preserve the security of the dynasty. The Eight Banners and the Army of the Green Standard constituted the two main divisions of the Chinese military.

The Eight Banners had been created by the Qing dynasty founder, Nurhaci (1558–1626). The descendants of the original Manchu conquerors comprised the Eight Banners, while Mongols and Han Chinese who had supported the dynasty prior to 1644 maintained their own 8 banners, for a total of 24 banners. Membership was hereditary, with fathers serving until their sons came of age. Officer positions were filled through appointment, and distinguished service could result in a bannerman being elevated to officer status, even senior officer positions. Manchu and Mongol banners served primarily as cavalry forces, while the Han Chinese banners provided infantry and artillery units. Approximately half of the banner force was stationed near the capital at Beijing, serving a dual role as the dynasty's military reserve and main striking arm. Banner garrisons were widely dispersed along the western frontier, in key cities, and along strategic internal waterways such as the Yangzi River and the Grand Canal. These garrisons rotated with the capital garrisons. Manchu bannermen, who were forbidden to intermarry with local inhabitants or undertake alternative

employments in their garrison communities, remained segregated from the local Han Chinese communities.

The soldiers of Chinese military commanders who joined the Manchus during or immediately following the conquest formed the Army of the Green Standard. Recruitment to fill positions in the army focused on the sons and relatives of serving soldiers, and those who enlisted did so voluntarily for long-term service. Green Standard garrisons functioned as a constabulary force and thus were even more widely and thinly dispersed throughout the country to maintain law and order and quell small-scale disturbances. To prevent a potential mutiny, this deployment pattern limited the size of any force under the command of a single military or civil official to 5,000 men, though most detachments were much smaller. During major campaigns, Green Standard soldiers, along with banner troops, could be drawn together and placed under the command of a special commissioner appointed directly by the Qing emperor. Green Standard soldiers also were socially segregated, though less formally, due to their poor standard of living and the antimilitary bias of Chinese society. A Chinese adage demonstrates the disdain that Chinese society had for military men: "Good iron is not made into nails, good men are not made into soldiers." The Army of the Green Standard was equipped with the matchlock rifle, which was inferior to firearms used in Europe at the time but was equivalent or superior to its adversaries' arms. The Green Standard was about 600,000 soldiers strong during the late eighteenth century, compared to 300,000 for the Eight Banners.

The Army of the Green Standard also served as the Chinese naval force tasked with antipiracy activities. This naval force operated small patrol craft, mounting small cannons, and effectively maintained the peace on major inland waterways. As for coastal security, large pirate gangs outclassed this rudimentary naval force. When confronted by these large pirate operations, Qing leaders preferred to incorporate pirate forces into the navy rather than openly confront them.

During the eighteenth century the Chinese military enjoyed considerable success expanding the empire in Mongolia and Tibet and asserting

tributary status in Burma and Nepal. However, a process of corruption and decay combined with a series of internal uprisings, including the Miao Revolt (1795–1806), the White Lotus Rebellion (1796–1805), and the Eight Trigrams Rising (1813), seriously weakened the Qing military. The White Lotus Rebellion alone required ten years to suppress; it involved crippling financial expenditures and reliance upon locally recruited self-defense militias. Yet the standard military formations remained fundamentally unaltered and entirely incapable of meeting the emerging foreign threats and major internal rebellions of the mid-nineteenth century.

Military Modernization in the Late Qing Era

During the nineteenth century, China experienced repeated humiliating losses to Western powers and devastating internal rebellions that threatened the continued existence of the Qing dynasty. Thus, the early focus of the Self-Strengthening Movement (1860–1895) was the modernization of the Qing military. These reforms enjoyed qualified success during the Sino-French War (1884–1885) and in the process of suppressing internal revolts such as the Taiping Rebellion (1850–1864). However, military reforms remained decentralized, carried out by regional officials, and were limited to strictly military technology. The inherent weaknesses of the Qing military modernization were revealed with China’s humiliating defeat in the Sino-Japanese War (1894–1895).

After China’s defeat by Great Britain in the Opium War (1839–1842) and by Great Britain and France in the Arrow War (1856–1860), Qing officials recognized the critical need to develop

modern Western-style military technology. The earliest exponent of the superiority of Western weapons was Commissioner Lin Zexu (1785–1850), who had triggered the Opium War. He initiated the purchase of foreign-made cannons to protect Guangzhou and ordered the translation of foreign gun-making manuals. Subsequent regional officials such as Zeng Guofan (1811–1872), Li Hongzhang (1823–1901), and Zuo Zongtang (1812–1885), who rose to national prominence leading regional armies against the Taiping Rebellion, all supported the use of Western-style infantry firearms, artillery, and steamships.

During the 1850s and 1860s the regular military formations, the Eight Banners and Army of the Green Standard, demonstrated their nearly total inability to quell internal and external threats. Qing regional officials and their armies began to utilize foreign weapons after witnessing their effectiveness on the battlefield. In addition to adopting Western weaponry and steamships, Li Hongzhang recommended the adoption of Western knowledge, the establishment of translation offices, and the creation of institutions where Chinese students could study Western sciences in order to modernize the Qing military. Yet Qing officials made little or no effort to thoroughly study and employ Western training and organization in their military formations.

To produce Western weapons and steamships, regional officials established a number of arsenals and shipyards, forming the basis of a fledgling modern armaments industry. The most renowned of these modern institutions were the Jiangnan Arsenal and the Fuzhou Navy Yard. Zeng Guofan sponsored the early establishment of what would become the Jiangnan Arsenal in 1865. This arsenal utilized American-made machinery to manufacture rifles, ammunition, and artillery and even developed a limited shipbuilding component. The Fuzhou Navy Yard was established in 1866 under the sponsorship of Zuo Zongtang. Two Frenchmen directed the operations of the yard, which produced 40 ships before 1884. In addition to building steamships, the Fuzhou Navy Yard trained students in foreign languages, shipbuilding, and navigation. Additional arsenals were founded throughout the country. However, these domestic firearms and steamships were more expensive to produce

and were technologically inferior to their Western counterparts.

The effectiveness of these military modernizations remained limited. Qing officials, relying upon regional armies utilizing modern weapons, suppressed the Taiping Rebellion, the Nian Rebellion (1851–1868), the Muslim Revolt in Yunnan (1855–1873), and the Northwestern Muslim Rebellions (1862–1877). The efforts to modernize the Qing military displayed mixed results in the Sino-French War. The Qing southern fleet was easily destroyed near Fuzhou by a French naval squadron. On land, Qing soldiers successfully defended Danshui on the island of Taiwan against a French landing force. At Lang Son in northern Vietnam, Qing forces defeated the French and advanced toward Hanoi. The ultimate failure of Qing military modernization occurred when Japanese army and naval forces humiliatingly destroyed the Qing dynasty's best armies and northern fleet during the Sino-Japanese War.

Many factors contributed to the failure of China's Self-Strengthening Movement and its military modernization efforts in particular. Qing officials appreciated Western military technology but dismissed Western training and organization, which were necessary to make full and effective use of the technology. Chinese conservatives hampered the reforms by stressing proper ethics over foreign technical skills. In addition, underlying social attitudes denigrating military careers undermined any thoroughgoing reform effort. Military modernization remained in the hands of regional officials and thereby suffered from a lack of centralized planning and direction. Finally, officials relied too heavily on foreign experts for the operation of modern sophisticated military armament industries. The French directors of the Fuzhou Navy Yard had no experience building ships, and the English director of the Jiangnan Arsenal was a medical doctor. Chinese unwillingness to engage in fundamental political and social reform in tandem with military technological modernization doomed the military dimension of the Self-Strengthening Movement.

Meiji Japan's New Army and Navy

The Meiji Restoration (1868) ended almost a millennium of feudal rule in Japan and marked the onset of extensive modernization under a seemingly restored imperial rule. The young Emperor Mutsuhito adopted Meiji (Enlightened Rule) as the name of his reign, which lasted until 1912. During this era the newly formed Japanese Imperial Army and Navy were turned into a modern and highly efficient military machine, enabling Japan to fulfill its imperial aspirations in East Asia.

Following the restoration, the new Japanese oligarchy resolved to disband the numerous feudal militias and to establish a national army. Believing that a strong army would be the foundation of a strong nation, it issued the first conscription law in 1872, requiring all men between 17 and 40 years of age to enlist for military service. Unable to recruit all of them, the new army consisted at the end of that decade of only about 30,000 men and an additional 40,000 men in reserve. Initially the army chose the French army as a model, but its defeat in the Franco-Prussian War affected a shift to the Prussian system.

The transformation to the new model took more than a decade and was boosted in 1885 by the arrival of the German officer Klemens Meckel, who assisted in building a national Japanese army in its modern form. One of his most important contributions was the notion of the independence of the supreme command, which took deep root in modern Japan. The army acquired its first significant combat experience in the First Sino-Japanese War (1894–1895), emerging from this conflict as a modern and motivated force. In the next decade the army grew

➤ MARESUKU NOGI

Maresuke Nogi (1843–1912) is probably the most famous army officer of the Meiji era, recognized both in Japan and abroad. He was born in Edo (now Tokyo) to a samurai family and fought against the shogunal forces during the Meiji Restoration. He was commissioned in the new Imperial Army as a major and took part in quelling the Satsuma Rebellion in 1877, where his unit lost its colors to the enemy. Disgraced, Nogi offered to commit suicide, but the notion was rejected by the emperor. In the next decade Nogi was sent to study in Germany. He then returned to command a brigade in the First Sino-Japanese War, during which he captured the Chinese fortress at Port Arthur at the cost of only 16 of his soldiers. Although he went into virtual retirement in 1901, when the Russo-Japanese War broke out Nogi was called again. He was soon appointed commander of Third Army and assigned to recapture Port Arthur. After a long siege during which he lost his two sons, Nogi, by now a full general, fulfilled his mission but at an extremely heavy cost in casualties. He was then made a count and appointed president of the Peers' School; however, on the death of Emperor Meiji in 1912, Nogi and his wife committed suicide. This act made them a living symbol of bushido (warrior) spirit and won Nogi nationwide fame throughout the following decades.

—Rotem Kowner

*Japan's Maresuke Nogi was the capable, if unimaginative, officer who conducted the successful siege of Port Arthur during the Russo-Japanese War of 1905. (Michael J. F. McCarthy, *The Coming Power*, 1905)*

substantially and prepared for confrontation with Russia. It also began to produce its own field guns, rifles, and most of its ammunition, although it still purchased machine guns and heavy howitzers abroad.

The Russo-Japanese War (1904–1905) was the greatest test of the Japanese army of the Meiji era. The army, which initially consisted of about 850,000 troops (including reserves), proved a tough adversary with a strong fighting spirit. It did not lose a single battle throughout the war and consequently was considered the strongest force in East Asia. The legacy of that war served as the point of departure for all military plans and thoughts during the next four decades.

Compared with its rival service, the Japanese Imperial Navy had a remarkably short history, which had both merits and drawbacks. Despite

being an island nation, Japan had a limited naval tradition, and for most of the premodern era the shogunal regime forbade sailing beyond Japanese coastal waters. After the restoration the Meiji oligarchy regarded a strong navy as a basis for maintaining the sovereignty of Japan, and in 1872 the Ministry of the Navy was established, separate from the Ministry of the Army. The navy leaders decided to emulate the British Royal Navy, but during the 1870s the navy took second place in the national defense policy, and its level remained low. During the 1880s, however, the navy discarded its old vessels and began to purchase British-built warships.

The war against China boosted the navy's new sense of confidence, providing it with significant operational activities. Consequently, the navy announced a ten-year expansion program

aimed against a large foreign navy, such as the Russian Pacific Fleet. Equipped with six modern battleships, the Japanese navy was the sixth largest in the world in 1904. During the Russo-Japanese War it performed extremely well and annihilated two of Russia's three fleets. After the war the navy announced another expansion program through which it became a mighty seagoing force, respected by all its peers.

Chinese Wars in Mongolia, Tibet, Nepal, and Burma

Chinese wars in Mongolia, Tibet, Nepal, and Burma countered the Inner Asian nomadic threat, expanded the Qing empire to its largest territorial extent in the west, and imposed tributary status on two neighboring states. The Manchus, with their Mongol allies, fought the powerful Zunghars for control over Mongolia and to stop the Inner Asian invaders who had historically threatened Chinese dynasties. In Tibet the Qing dynasty fought to retain control over the succession of the Dalai Lama and his vital religious-political influence and to protect Tibet from Nepalese invaders. With Burma and Nepal, military invasions led to the resumption of tributary relations between the Qing dynasty and its neighboring states.

The Zunghars, a confederation of Mongolian, Tibetan, and Turkish peoples under the

leadership of Galdan (r. 1661-1697), represented an authentic threat to the Manchu hold on China in the late seventeenth and early eighteenth centuries. When Galdan threatened Mongolia in 1690, the Kangxi Emperor (b. 1654, r. 1661-1722) personally led the first expedition to break Galdan's power and force his withdrawal to Zungharia. This first encounter ended with a negotiated settlement between Kangxi and Galdan, mediated by representatives of the Dalai Lama. Zunghar forces retreated to western Mongolia, where they were protected by the vastness of the Mongolian steppe and the limitations of Qing logistics. When Kangxi later plotted the destruction of Galdan, he made elaborate preparations to supply his armies and draw Galdan's forces closer to Manchu power centers in eastern Mongolia. When Galdan again ventured eastward in 1696, Kangxi dispatched three armies totaling over 100,000 men to trap and destroy the Zunghars. Qing forces crushed Galdan at Jao Modo, and subsequent campaigns harried Galdan to his death in 1697.

Galdan's defeat and death did not completely destroy the power of the Zunghar state. Incapable of expanding eastward, Zungharia remained safe due to its remoteness from the centers of Qing power. In 1717 the Zunghars launched an invasion of Tibet in a dispute over the succession of the Dalai Lama. Tibet was important not because of its military or strategic location but rather because of its spiritual significance in the person of the Dalai Lama and the Tibetan Lamaist faith. The Zunghars sought to control the Dalai Lama and use his religious-political influence to undermine Lamaist Mongol support for the Manchus. Mongol princes provided critical support to the Qing dynasty, occupying strategic locations and supplying significant contingents of troops along China's western frontier. Thus, Kangxi responded vigorously to this Zunghar threat to his influence over his Lamaist Mongol supporters. The Chinese invasion of Tibet began in 1718, with one army marching via Kokonor toward Lhasa and another force originating in Sichuan Province. This latter force faced minimal Zunghar opposition and arrived in Lhasa in 1720. The Zunghars concentrated their efforts against the Kokonor army, which was nearer; threatened

their line of retreat; and included the legitimate Dalai Lama, who was greeted along his route by supporters offering their homage, gifts, and support. The Kokonor army also reached Lhasa in 1720, ending the Zunghar occupation of Tibet and securing Qing claims to a protectorate over Tibet.

The final blows against the Zunghars were landed by three massive campaigns during 1755–1760 launched by the Qianlong Emperor (b. 1711, r. 1735–1796). Internal strife led to a division within the Zunghar state that prompted Qianlong to act. These campaigns destroyed the Zunghar state and extended Qing conquests westward. The success of these campaigns in Mongolia and Tibet demonstrated the early martial vigor of the Qing military and Qing recognition of the potential nomadic threat from Inner Asia.

China once again intervened on behalf of Tibet in a conflict with Nepal. In a dispute over trade relations and control of mountain passes between Nepal and Tibet, the Gurkhas raided Tibet in 1788 and again in 1791. In 1792 a Chinese army easily expelled the Gurkhas from Tibet and marched on the Nepalese capital at Kathmandu. Under this threat the Gurkhas signed a treaty revoking their trading privileges in Tibet and requiring Nepal to accept tributary status and send tribute mission to the Qing emperor once every five years.

Chinese military success in Mongolia, Tibet, and Nepal must be tempered by their unmitigated failure in Burma. During 1765–1770 four annual invasions of Burma met with total disaster. The motivations for the invasions lay in China's concern over the growing military power of the Konbaung dynasty in northern Burma; the destruction of Ayuthia (in modern Thailand), a tributary state of China; and a desire to reimpose tributary status on Burma. Burmese forces repeatedly outmaneuvered, outfought, and destroyed Qing armies severely weakened by disease. After the defeat of the fourth expedition, the Burmese and Chinese generals negotiated a settlement that restored trade relations and stipulated that decennial tributary missions be sent to China, preserving the fiction of Burma returning to its vassal status.

The Opium War (1839–1842)

The Opium War, also known as the First British War, was fought between Great Britain and China after the Qing government sought to curtail the importation and sale of opium in China. The first defeat of China by a European power, the war had far-reaching repercussions. The ensuing Treaty of Nanjing, which forced China to lower its tariffs, cede Hong Kong to the British, and pay a substantial indemnity, was the first unequal treaty imposed on China by a Western power.

The war was the culmination of a series of disputes over trade, especially in opium, between the Qing government and the British going back to 1773, when the British East India Company established a monopoly over opium cultivation in India and began granting licenses to "country traders" who sold the opium in Guangzhou (the only Chinese port open to Western merchants) in return for silver. The silver then was deposited with company agents, who used it to purchase tea, silks, and other Chinese goods for resale, mainly in Europe. Chinese merchants sold the opium to Chinese customers, some of whom became addicted. Imports of opium grew from approximately 1,000 chests of opium (each chest weighing between 125 and 150 pounds or between 56 and 68 kilograms) in 1773 to 32,750 chests in 1832. After the East India Company lost its trade monopoly in 1833, new trading groups entered the Chinese market, and sales grew further. The outflow of silver to pay for opium purchases and increased levels of addiction had been matters of concern for the Qing government since the early 1800s, and 1838 the Daoguang emperor

decided to abolish the opium trade altogether. To enforce the edict, he appointed as commissioner the respected official Lin Zexu (1785–1850), who in 1839 launched a campaign against opium use and ordered an end to all trade with the West unless Western merchants surrendered the opium in their warehouses. In response, the Western merchants gave over 20,000 chests of opium, which were then destroyed.

This did not bring an end to tensions, however. In July 1839 a group of drunken British and American sailors killed a Chinese civilian at Kowloon, a provisioning point near Hong Kong. The Chinese demanded that the British surrender the murderer, but after the British superintendent of trade Charles Elliot refused to comply, they forced all British merchant ships to retreat to Hong Kong (then a minor outpost). HMS *Volage*, a 28-gun frigate, joined the British merchant ships anchored off Hong Kong on August 31, and four days later when British merchant ships attempted to land at Kowloon for supplies and were attacked by Chinese junks (warships), the *Volage* returned fire, damaging several junks. Soon a number of other British warships joined the *Volage* in protecting British trade interests.

During an uneasy truce, interrupted by further disagreements and sporadic clashes between Chinese and British ships, the London government ordered the East India Company to raise at government expense a fleet and an army to force the Chinese to pay damages and other concessions. This force, consisting of 15 men-of-war, 5 armed East India Company steamers, and about 4,000 British and Indian troops, landed at Macao in June 1840. Sailing north, on July 5 the British bombarded and seized the main town on Zhoushan Island (at the entrance to Hangzhou Bay). The British fleet also blockaded Guangzhou, a number of other ports, and the mouth of the Yangzi River.

Negotiations followed, and an agreement was reached in January 1841 wherein the Chinese agreed to open additional ports to trade, pay an indemnity for the destroyed opium, and cede Hong Kong to the British. Enraged at the terms, the emperor rejected the agreement, and the war continued. British operations under Major General Hugh Gough took place sporadically

➤ CHANCELLOR LIN'S LETTER TO QUEEN VICTORIA

In the summer of 1839 as tensions with the British over the opium trade continued, Lin Zexu wrote a letter to Queen Victoria (r. 1837–1901) imploring her to intervene and halt the British trade in opium. An excerpt follows in which Lin Zexu attempts to illustrate China's objections to the opium trade:

“Suppose there were people from another country who carried opium for sale to England and seduced your people into buying and smoking it; certainly your honorable ruler would deeply hate it and be bitterly aroused. . . . We have further learned that in London, the capital of your honorable rule, and in Scotland, Ireland, and other places, originally no opium has been produced. Only in several places of India under your control . . . has opium been planted from hill to hill, and ponds have been opened for its manufacture. For months and years work is continued in order to accumulate the poison. The obnoxious odor ascends, irritating heaven and frightening the spirits. Indeed you can eradicate the opium plant in these places, hoe over the fields entirely, and sow in its stead the five grains. . . . For this, Heaven must support you and the spirits must bring you good fortune, prolonging your old age and extending your descendants. All will depend on this act.”

until May 1841, when the British decided to attack Guangzhou. The main force, totaling about 2,400 soldiers and sailors, was landed on May 24, 1841, and captured the city's western forts. Gough's force was poised to attack the city itself the following morning when the Chinese requested a truce. After a number of skirmishes in which about 15 British soldiers were killed and 112 were wounded, the force returned to Hong Kong a few days later.

The British then decided to shift their operations northward up the coast of China to the

Yangzi River. Gough's 2,700-man force began operations on August 20, 1841. Amoy, on the Chinese coast opposite Taiwan, was captured on August 26. Chinhai was captured on October 10, and Ningbo was captured three days later, after which the British force, due mainly to administrative and logistical shortcomings, went into winter quarters.

After fruitless negotiations, the Chinese counterattacked on March 10, 1842, but were easily repulsed. The British then recommenced their northward offensive, capturing Zhapu (south of Shanghai) on May 18 and Shanghai on June 29. The British continued up the Yangzi River, fighting their hardest battle at Zhenjiang, in which they suffered 34 dead, 107 wounded, and 3 missing, on July 21. With the British then threatening Nanjing, the Chinese "southern capital," the Chinese sued for peace, and hostilities ended on August 17, 1842. On August 28 the British and Chinese signed the Treaty of Nanjing in which the Chinese opened five ports for foreign trade, paid an indemnity of 21 million Mexican silver dollars, and ceded Hong Kong to the British. The opium trade, the ostensible cause of the First China War, was not mentioned in the Treaty of Nanjing, so the sale of opium continued.

Guangzhon Arrow War

On October 3, 1856, a Chinese force in Guangzhon inadvertently sparked a war between China and Great Britain when it boarded the Chinese-built, Chinese-owned vessel *Arrow* to capture

criminals spotted among the crewmen. The French, incensed over the murder of a French missionary earlier in the year, quickly joined Britain in the war. The United States and Russia did not participate as combatants but used the war to wrench concessions of their own from China. The war was spread over a four-year period and was fought in two distinct phases.

The immediate trigger for the first phase of the war seemed to the Chinese to be a simple matter of law enforcement. Chinese authorities conducted a raid after receiving notice that pirates were among the crew. In all, they arrested 12 Chinese crewmen. The *Arrow* was a European-style schooner outfitted with Chinese sails and rigging and was owned by a Chinese subject named Fong Ah-Ming. The Treaty of Nanjing had granted certain immunities to Chinese employed by or closely associated with the Europeans in China. A number of Chinese merchants, including Fong, took the precaution of registering ships with the Crown colony of Hong Kong, ostensibly to gain British protection against coastline pirates. The commission issued by the colonial office, which expired before the ship reached Guangzhon, gave the *Arrow* permission to fly the British flag, although it is a matter of dispute whether or not the flag was flying at the time the ship was boarded. Like the owner, the entire crew was Chinese except for the captain, an Irishman named Thomas Kennedy who admitted to only nominal authority and was not on board at the time of the incident.

The governor of Hong Kong, John Bowring, doubted that the ship could rightfully fly the flag and claim the protection after the commission had lapsed but was unable to halt the violence. In retaliation for the incident, Harry Parkes, the British consul at Canton, ordered the seizure of a Chinese war junk and began to bombard Guangzhon. The Chinese released the arrested men, but Parkes demanded an apology and admission of wrongdoing and continued shelling the city. Ye Ming-Zhen, the governor of Guangzhon, ordered a military response. The people of Guangzhon supported Chinese forces by attacking and destroying foreign factories.

In Great Britain, parliamentary leaders were very critical of Parkes for initiating the war but pursued the war because of their continuing

dissatisfaction with continuing Chinese restrictions on British traders. Ultimately, the British considered the Arrow War to be a defense of its right to free trade and pursued the hostilities until the summer of 1857, when an Indian uprising diverted them throughout the autumn. British and French troops captured Guangzhou soon after bombardment resumed in December. By May, the Chinese were ready to negotiate. The 1858 Treaty of Tianjin opened more ports to foreign trade, allowed freedom of movement for Europeans in China, provided for diplomatic missions in Beijing, and forced the Chinese to abandon their prohibition of the opium trade. Under the Most Favored Nation Doctrine, France, Russia, and the United States received the same concessions.

Hostilities recommenced in 1860, the result of disagreements over the provision of the Tianjin treaty permitting British diplomatic missions to the imperial court in Beijing. For Britain, this involved more than national pride. British merchants had long complained about their mistreatment by corrupt local officials. Unfortunately, the Chinese negotiator, Gueiliang, made the concession without the emperor's approval. The Xianfeng emperor was appalled, believing that the treaty lessened China's exalted position by reversing traditional relationships between China and foreign tributary states. He also suspected that the foreigners wanted access to install spies. Further talks with the British representative, Lord Elgin, led Gueiliang to believe mistakenly that Britain would settle for a permanent residence in Shanghai. When the British envoy arrived in China, the delegation was notified that ratifications would be exchanged at Shanghai, that the river leading to Tianjin had been blockaded, and that the forts on the shores would permit no passage.

The British responded by sending a second military expedition to China under Lord Elgin's command. They were again joined by the French. By August 1860, European forces pushed north and threatened Beijing. Parkes again became involved in the fray when during a meeting he insulted Qing Prince Yixin, who responded by ordering Parkes's arrest. Elgin retaliated by charging into Beijing, at first intending to burn all the imperial buildings to the ground. Russian and

➤ THE LOOTING OF THE SUMMER PALACE

The Qing Summer Palace was looted by the French and British armies in the last days of the Arrow War. Before the British burned the palace, their army attempted to justify their large-scale theft by forming a prize commission. All looted items were collected and then sold in auctions, which resulted in raising the not unsubstantial sum of £26,000. The profits were distributed to soldiers according to their rank. (Indian soldiers were excluded from the prize commission. They did not receive money and were not forced to turn over their loot.) Among items pilfered by the foreign troops were imperial robes and armor, jade scepters, throne cushions, a jade-covered book with Confucius's sayings, and a Pekinese dog, renamed "Looty." Some nonauctioned items, like Looty, were given to Queen Victoria, while others became regimental trophies. Today many of the looted items can be found in museums labeled "from the Summer Palace of the Emperor of China."

—Kassi Klinefelter

French diplomats convinced him to abandon the plan, but British forces destroyed the beautiful Summer Palace in a senseless punitive gesture.

The humiliated Qing dynasty ratified the Treaty of Beijing on October 24, incorporating the provisions of Tianjin and additionally ceding Kowloon, opening Tianjin to foreign commerce, and agreeing to a crushing indemnity. The United States and Russia again received the same concessions. The French also agreed to a separate treaty with a stipulation giving French Catholic missions landownership rights. Within a week of the British departure, Russia secured territorial concessions for lands east of the Ussuri River, now the border between eastern Russia and Manchuria. As foreign troops withdrew, Prince Yixin began formulating a plan for dealing with foreigners that was known as the Self-Strengthening Movement. This reform program, together with the defeat of the Taiping rebels, made it appear for a time that the Qing fortunes had been restored, but such was not the case. Although nominally in power for the next half century, the Qing dynasty never recovered.

The French Conquest of Vietnam

European powers came to Vietnam in their quest for religious converts, trade, and naval facilities. The first lasting contact between Vietnam and Europe resulted from the 1535 arrival of Portuguese explorer Antonio da Faria at Faifo (Hôian). Subsequently, both the Portuguese and Dutch established rival trading posts in Vietnam.

Steadily Southeast Asia began to attract more European attention.

By the late eighteenth century a Catholic priest, Pierre Pigneau de Behaine, became influential in Vietnam. He helped secure European mercenaries and military equipment crucial in enabling Nguyen Phuc Anh (from 1802, Emperor Gia Long) to reunify Vietnam. The French mercenaries brought with them numerous Western technological advances, including improved engineering and metallurgical techniques.

Emperor Gia Long (r. 1802–1820) welcomed Western military and technological assistance, but he was not interested in advancing Western religion. During Gia Long's reign, the European powers were too embroiled in the Napoleonic Wars to pay much attention to Vietnam. His successors, Minh Mang (r. 1820–1841), Thieu Tri (r. 1841–1847), and Tu Duc (r. 1848–1883), were much less successful than he was in meeting Western pressures. They were forced to deal with reawakened European imperialism; Gia

▶ PHAN THANH GIAN'S LAST LETTER TO EMPEROR TU DUC, 1867

Having gained control of Saigon and three surrounding provinces in 1862, the French sought to extend their authority in Cochinchina (their name for southern Vietnam) in 1867 by invading three more provinces to the west, based on their claim that political disturbances in the area threatened French claims to Cambodia. The appointed governor of these provinces, Phan Thanh Gian (1796–1867), who had visited France and was fully aware of French military strength, saw no alternative to capitulation. In shame, he sent the following letter to Emperor Tu Duc and then took his life.

“The empire of our king is ancient. Our gratitude toward our kings is complete and always ardent; we cannot forget them. Now, the French are come, with their powerful weapons of war to cause dissension among us. We are weak against them; our commanders and our soldiers have been vanquished. Each battle adds to our misery. . . . The French have immense warships, filled with soldiers and armed with huge cannons. No one can resist them. They go where they want, the strongest ramparts fall before them. . . . I have

raised my spirit toward Heaven and I have listened to the voice of reason. And I have said, ‘It would be as senseless for you to wish to defeat your enemies by force of arms as for a young fawn to attack a tiger.’ . . . I have thus written to all the mandarins and to all the war commanders to break their lances and surrender the forts without fighting.

But, if I have followed the Will of Heaven by averting great evils from the head of the people, I am a traitor to our king in delivering without resistance the provinces which belong to him. . . . I deserve death. Mandarins and people, you can live under the command of the French, who are only terrible during battle, but their flag must never fly above a fortress where Phan Thanh Gian still lives.”

—Carolyn Neel

Long himself would probably have been little more successful in resisting it.

The Vietnamese emperors regarded Catholicism, Buddhism, and Daoism as threats to the Confucian concept of order and harmony. The attempts by the nineteenth-century Vietnamese emperors to root out Christian missionaries provided the excuse for French intervention. Unfortunately for the Vietnamese, they had shown little interest in the vast improvements in armaments that had occurred in the half century since the reunification of their country. They were at a great disadvantage when the inevitable collision with the West occurred.

Missionary fervor was not the only factor pushing the French to intervene in Vietnam; trade may have been a more powerful force. In the 1840s the British had taken the lead in obtaining trading concessions in China. The French were fearful of being left out and soon followed suit, using their China squadron as a military means of applying pressure on Vietnam. The French hoped that Vietnam might provide access to the interior of China by means of the Mekong and Red rivers.

Alleged mistreatment of Catholic missionaries was the excuse for French intervention. In 1845 and again in 1846, French warships were sent to Vietnam to secure the release of Monseigneur Dominique Lefèvre, who had been imprisoned on imperial order for refusing to leave the country. During the second intervention, French warships sank four Vietnamese warships that they regarded as presenting a hostile intent.

Emperor Tu Duc (r. 1847–1883) began rigorously enforcing the ban on Christianity, executing a Spanish bishop in 1855. Napoleon III joined the Spanish in a military venture, ostensibly to protect missionaries but with the additional French objective of obtaining commercial rights. On August 31, 1858, a Franco-Spanish squadron of 14 ships and 3,000 men (500 Spanish) commanded by Admiral Charles Rigault de Genouilly arrived at Tourane (Da Nang) and anchored there. The next day a landing party went ashore. Tourane proved no prize, and the expedition soon moved southward. On February 18, 1859, the French took Saigon. Then a sleepy little fishing village, it had promise of being an excellent deepwater port.

In 1862 Emperor Tu Duc was obliged to sign a treaty confirming the French conquest. It was no accident that the French chose to penetrate southern Vietnam first; it was the most recently acquired part of the country.

Sino-French War, 1884–1885

The Sino-French War formally began on August 26, 1884, as a result of French ambitions to extend their colonial protectorate in Vietnam and the Qing dynasty's intervention, after much indecision, to protect its vassal state. French prime minister Jules Ferry sought to extend French colonial holdings, sever Chinese claims to Vietnam, and discover an avenue for opening China's internal markets. The Qing dynasty, citing its long cultural and political influence in Vietnam, refused to recognize French claims and was drawn into the war as a result of governmental infighting.

In 1882, French military officers occupied Hanoi and Haiphong in northern Vietnam, which led to increased Chinese support for irregular anti-French forces in the north. Within the Qing government, two distinct factions emerged. One faction supported negotiations, while the other supported a belligerent stance. Li Hongzhang, a powerful regional official, favored a negotiated settlement over a war that China was unlikely to win. Better than most officials, he knew that China's military modernization program remained incomplete. A group of young scholars opposed Li's policy of so-called appeasement and argued that China was honor-bound to defend its tributary state.

Repeated negotiation attempts foundered on the question of shared suzerainty. In 1884,

Li Hongzhang met with French naval captain F. E. Fournier, and together they hammered out the Li-Fournier Convention. This agreement called upon China to withdraw its forces from Vietnam and recognize French treaties regarding Vietnam. France would not ask for an indemnity or conclude a treaty that would annul former Chinese treaties with Vietnam. Ferry's government scorned the convention and objected to the retention of implied Chinese suzerainty in Vietnam. Li's desire for peace led him to conceal certain aspects of the convention from his own government, with disastrous consequences.

In June 1884 a French detachment encountered a Chinese garrison near Bac le on the Sino-Vietnamese frontier. The French officer ordered the Chinese garrison to withdraw as stipulated in the Li-Fournier Convention, which had yet to be ratified by either government. The Chinese garrison commander politely dismissed the demand for a Chinese withdrawal. He knew of the Li-Fournier Convention but had not received orders to withdraw to Chinese territory. Fighting broke out, and the Chinese forces were badly mauled. However, they held their position, and the French force withdrew.

The French accused the Qing government of bad faith and widened the scope of the conflict. A French naval squadron shelled the port of Jilong on Taiwan and landed troops, only to be repulsed by Chinese defenders. The Qing court appointed Li's political rivals to key defense posts in the south but did not formally declare war on France. This indecisiveness would prove costly for China. On August 23, a French naval squadron freely entered the port at Fuzhou, as no formal hostilities existed, and opened fire on the Chinese southern fleet. In less than an hour, French naval fire destroyed both the Chinese fleet and Fuzhou Navy Yard. China declared war three days later.

By December, the indecisive nature of the war sapped French popular and political support for a costly and faraway conflict. In China, anticipated foreign support failed to materialize; more ominously, concern mounted over potential Russian and Japanese advances in the north. Negotiations resumed in 1885 based upon the terms of the Li-Fournier Convention. These negotiations were aided at the last moment by

a Chinese victory at Lang Son, where a larger though poorly trained and led Qing army defeated a French expeditionary force. This victory allowed the Qing dynasty to negotiate from a position of parity and deflated any remaining French support for the war. It also led to the resignation of Jules Ferry on March 30 with the treaty unsigned. Hurried negotiations led to an armistice in April, and the final treaty was concluded on June 9, 1885.

The final treaty affirmed the French protectorate over all of Vietnam and severed China's tributary relationship. France also gained limited commercial and railway development rights in southern China. The Sino-French War must be seen as a French victory, as France gained its primary goal and detached Vietnam from China's tributary system. Though not a victory for China, the war exhibited a much-improved Chinese military compared to earlier conflicts. China had fought France to a stalemate on land and did not pay an indemnity for the first time in a war against a Western power.

Sino-Japanese War, 1894–1895

The Sino-Japanese War grew out of conflict between China and Japan for supremacy in Korea. The war marked the emergence of Japan as a major power in East Asia and highlighted the deterioration of the Chinese empire.

Korea's geostrategic position and coal and iron resources had put Korea, long a tributary state of China, in the focus of Japanese strategies. In 1875 Japan had pressured Korea to agree to the Treaty of Kanghwa, which forced Korea to open itself to Japanese trade and to proclaim independence from China. During the 1880s,

pro-Japanese reformers attempted to overthrow Korea's Joseon dynasty, but the attempt failed because Chinese troops intervened. War between China and Japan was avoided by the Tianjin Convention (1885), which required both sides to withdraw their forces, to not send military instructors, and to notify the other before it deployed troops to Korea.

Relations deteriorated in 1893, however, after Kim Ok-kyun, a pro-Japanese Korean revolutionary, was killed in Shanghai, supposedly by Chinese agents. Further tensions emerged later that year when the Korean emperor requested Chinese military aid to suppress the nationwide peasant revolt known as the Tonghak Rebellion. Chinese troops under General Yuan Shikai (1859–1916) were sent to Korea in accordance with the Tianjin Convention. However, Japan considered this action a violation and sent a Japanese expeditionary force to Korea. In July the Japanese seized the imperial palace and replaced the emperor with a pro-Japanese puppet. After the Chinese refused to recognize the new emperor, war was declared on August 1.

The demoralized and poorly equipped Chinese army was no match for the Japanese, whose army and navy had undergone significant modernization during the Meiji period. The Japanese forces defeated the Chinese Beiyang Army in a series of battles and pushed farther north into Manchuria, while the Chinese navy suffered defeat off the mouth of the Yalu River. Following the fall of Weihaiwei (February 2, 1895), Japanese forces moved forward into southern Manchuria and northern China and subsequently controlled sea approaches to the Chinese capital.

Facing defeat, China entered negotiations with Japan and signed the Treaty of Shimonoseki on April 17, 1895. China agreed to accept full independence of Korea; ceded the Liaodong Peninsula (then part of Fentian Province, present-day Liaoning Province), the Pescadores, and Taiwan to Japan “in perpetuity”; had to pay 200 million taels in reparations; had to open the Yangtze (Changjiang) River to Japanese ships; and had to open four more treaty ports.

Although the treaty proved that Japan was the dominant power in East Asia, the Triple Intervention (Russia, France, and Germany)

➤ A CONVERSATION BETWEEN LI HONGZHANG AND ITO HIROBUMI

While negotiating the Treaty of Shimonoseki in 1895, Li Hongzhang, a leading Chinese statesman and strong advocate of modernizing China, and Ito Hirobumi, Japan's prime minister, had the following exchange:

“Li: ‘China and Japan are the closest neighbors, and moreover we have the same writing system. How can we be enemies? We ought to establish perpetual peace and harmony between us, so that our Asiatic yellow race will not be encroached upon by the white race of Europe.’ Ito replied, ‘Ten years ago I talked to you about reform. Why is it that not a single thing has been changed or reformed?’ Li could only say, ‘Affairs in my country have been so confined by tradition that I could not accomplish what I desired. . . . I am ashamed of having excessive wishes and lacking power to fulfill them.’”

Java War

The Java War was fought between the Dutch and rebel forces led by Prince Diponegoro of the sultanate of Yogyakarta between 1825 and 1830. This was not the first conflict between the Dutch and native peoples since the Dutch United East India Company (Vereenigde Oost-Indische Compagnie, or VOC) arrived in 1602. However, no previous conflict resulted in so many casualties or had such important consequences.

The war's roots go back to the early 1800s, when dynastic disputes, increased European interference in Javanese affairs, and growing peasant discontent ended a half century of relative political stability between the VOC, which controlled the western part of the island, and the kingdoms of Yogyakarta and Surakarta, which controlled the central and eastern regions, respectively. With the bankruptcy and liquidation of the VOC in 1799, its assets were taken over by the Dutch government, which then was controlled by France as a result of the French occupation during the Revolutionary wars. In 1808 the French-dominated government charged the newly appointed governor-general of Java, Herman W. Daendels, with expanding Dutch authority throughout the island. His efforts alienated Javanese lords in Dutch-controlled territory by reducing their incomes; he also angered the rulers and aristocrats of Surakarta and Yogyakarta by asserting Dutch sovereignty over both kingdoms. In 1811, as part of the Napoleonic wars, the British occupied the Dutch colonies in the Indies, including Java. Under British lieutenant governor Stamford Raffles, conflict with the Javanese kingdoms continued. In 1812 a European-sepoy army conquered the forces of the king of Yogyakarta Hamengkubuwana II and temporarily replaced him with his son Hamengkubuwana III. In 1816 Java was returned to the Dutch, who continued these harsher policies toward the Javanese kingdoms.

In the midst of these growing tensions, the peasants' situation deteriorated. In central Java large tracts of land were rented out by aristocrats to Chinese and European entrepreneurs, who forced villagers to work on their plantations and ignored the peasants' traditional rights. Further hardship resulted from new taxes on

the transport and sale of rice from one area to another and the requirement that peasants pay taxes in money rather than in kind.

Two events led directly to the war. In 1823 the Dutch governor-general further angered members of the aristocracy when he abolished the leasing of land to Chinese and Europeans. The aristocrats not only lost this source of revenue but also had to compensate the leaseholders for capital improvements they had made on the land. Then in 1825 a clash broke out over a Dutch road-construction project that would have destroyed the tomb of a Muslim saint. The owner of the land, a Yogyakarta prince, Pangeran Diponegoro, refused the Dutch permission to build the road and raised the banner of rebellion.

The popular Diponegoro, the son of Hamengkubuwana III, had twice been passed over for the kingship, in part as a result of the machinations of European officials. A devout Muslim, he had traveled widely to Java's holy sites and had come to be viewed by many as the *ratu adil* (righteous king), who they believed would reign justly after a short period of war. His call to rebellion, which he couched in terms of a jihad (holy war), gained support from at least half of the aristocracy, many devout Muslims, as well as many villagers.

By the end of 1826 Diponegoro controlled the countryside in central Java, but a year later the tide had turned against him with the arrival of Dutch reinforcements. The Dutch general H. M. de Kock developed the *benteng* (fortress) system in which small mobile columns operated independently of a growing network of strategic fortified posts. Throughout 1828, many of Diponegoro's followers defected or ceased to support the rebellion. The surrender of his uncle Mangkubumi and his commander Sentot in 1829 made his situation hopeless. In early 1830 Diponegoro met with de Kock, demanding recognition as ruler of a free state and the head of Javanese Muslims. Instead Diponegoro was arrested and exiled to Makassar, where he died in 1855.

The war had cost the lives of 15,000 government soldiers and about 200,000 Javanese, mostly as a result of famine and disease. The end of the war ushered in a new era in which the power of the Dutch colonial state increased at

the expense of the local authority of the Javanese aristocracy.

Aceh Wars

Beginning in 1873, the contest for the former sultanate of Aceh was emblematic of the struggle for Islamic independence in the Indonesian archipelago. The Aceh Wars, also referred to as the Achinese War, were the longest conflict in which the Dutch became embroiled in Indonesia and formally lasted until 1903, although fighting persisted well into the following decade.

Aceh had long served as one of the principal centers for the study of Islam and as a gateway for the pilgrimage to Mecca. By the late sixteenth century, it had become the most powerful state in Sumatra, reaching its apogee under Sultan Iskandar Muda (r. 1607–1636). This state exercised control over territories in the west of present-day Indonesia and Malaysia and forged formal links with the Ottoman empire. The following centuries, however, witnessed a decline in Acehnese fortunes, though the region persisted as an independent kingdom.

The 1824 Treaty of London divided insular Southeast Asia into British and Dutch spheres while recognizing Acehnese sovereignty. Anxiety about the intervention of a third power in the region led Great Britain and the Netherlands to conclude a new agreement in 1871, allowing for Dutch intervention. The Dutch alleged, with little evidence, that the Acehnese were seeking to negotiate with the United States. On the pretext that the sultanate was sponsoring piracy in the Straits of Melaka, they sent an expedition to

north Sumatra in March 1873. This poorly prepared force did not even locate the royal residence and was forced to retreat after the death of its commander, General Köhler.

A massive expedition, better planned and equipped, was mounted in late 1873. This time, the palace was captured and the sultanate was declared at an end; on January 31, 1874, General van Swieten proclaimed Aceh a part of the Netherlands Indies. This proved to be a hollow victory. The young successor to the throne, Muhammad Dawot (Muhammad Daud), was taken to safety while a key adviser to the late sultan, Habib Abd al-Rahman al-Zahir (1833–1896), continued to press for Ottoman aid from Istanbul. Such aid was not forthcoming, but the continuing resistance of the Acehnese served as a source of inspiration for many of the Muslims of the Netherlands Indies and the Malay Peninsula and among the Southeast Asian community in Mecca.

Effective resistance to Dutch incursions now passed briefly to the various petty lords (*ulëëbalang*). Subsequently, opposition was undertaken by the religious leaders, the ulama. Key ulama such as Teungku di Tiro (1836–1891) enjoyed popular support bolstered by widely disseminated texts equating the struggle with a holy war, a *jihad* (Arab) or *perang sabi* (Aceh). In 1876 and after two years spent gathering support from the British port of Penang, Abd al-Rahman al-Zahir returned to Aceh to coordinate the resistance. He soon fell out with the local leadership and submitted to the Dutch in 1878 in exchange for a lifelong pension in Mecca. The war dragged on regardless.

With an uncertain foothold on the coast and beset regularly by cholera and dysentery, the Dutch would opt to fortify their position as a base from which to launch incursions into the surrounding territory. This state of affairs prevailed for several years, being formalized with the so-called line of concentration, inaugurated under General van Pel (d. 1876). Thereby, the capital was surrounded by a series of fortified posts connected by an armored tramway. This policy worked to the advantage of the Acehnese leadership. The vast majority of Greater Aceh was still impassable for the Dutch.

A third campaign to complete the pacification of the province was begun in 1884. But with

the Indies in recession and the ongoing campaign causing substantial hardship in Java, where most colonial revenues were raised, the morass persisted. Criticism of the war from within Dutch and Indies society led to the appointment of an Aceh veteran, J. B. van Heutsz (1851–1924), as military governor in 1898. With the advice of Christiaan Snouck Hurgronje (1857–1936), whose studies had identified the uléëbalangs as potential clients and who counseled the vigorous prosecution of guerrilla tactics against the ulama, van Heutsz engaged in a series of successful campaigns, advancing Dutch control across Pedir (1899–1901) and Daya (1898–1903) and pushing into the Gayo highlands by 1903. In each territory, the local uléëbalang, on submission, was obliged to sign “the short declaration,” a document drafted by Snouck Hurgronje that pledged allegiance to the Dutch sovereign and her agents.

Victory finally seemed complete in 1903, with the submission of the aspirant sultan Muhammad Dawot. But the conflicts were by no means over: fighting continued until the taking of Alas (1907), and indeed scattered resistance

occurred until as late as 1912. Furthermore, Dutch rule, as enforced under van Heutsz and his successor van Daalen, was barely accepted, being accomplished by the use of extreme violence. The Aceh campaign would continue to haunt the Dutch in Indonesia, and its incorporation within the Java-centered Netherlands Indies would be a source of instability in the future nation of Indonesia.

■ Introduction: War and Warfare in the Americas

Battlefield victories and defeats played important roles in the histories of Canada, the United States, Mexico, and Central and South America between 1750 and 1914. The Thirteen Colonies of North America and the Spanish and Portuguese colonies of Latin America both gained their independence through wars. The American War of Independence (1776–1783), fought mainly by a single army formed by the Continental Congress and led by General George Washington, resulted in the creation of a single new republic, the United States of America. In contrast, the more protracted Latin American wars of independence (1808–1826) were fought on several fronts under regional commanders and resulted in the formation of a dozen new states whose early histories were marked by social conflict, regionalism, and political turmoil. For Canada, the British victory over France in the Seven Years’

War (1756–1763), in which key battles were fought at Montreal and Quebec City, forced a French withdrawal from North America and set Canada on a new course as a British colony. Canada’s political independence from Great Britain, which came with the passage of the British North America Act of 1867, was achieved through discussion and diplomacy rather than warfare, but military considerations also played a role. Those who supported Canada’s independence and the merging of its four provinces into a single unified state cited mutual defense against U.S. expansion as an argument in favor of such a step.

As a British colony between 1763 and 1867, Canada’s defense was provided mainly by units of the British army, which did most of the fighting along with a few Canadian militia units against invading American forces in the War of 1812. After the war the British maintained fortresses at

Halifax, Quebec City, and Kingston with a force that ranged from a low of 4,000 to a high of 18,000 in the 1860s, when fears of an American invasion heightened during the U.S. Civil War. After British troops withdrew following Confederation, even though all males between the ages of 18 and 60 were liable for conscription, responsibility for defense was given over to a small number of professional soldiers who garrisoned the forts inherited from the British and a larger “active militia,” a volunteer force that ranged between 30,000 and 40,000 part-time soldiers who attended summer training camps and were liable for active duty as necessary. Some militia units saw service in the suppression of the Métis Rebellion of the 1880s, but when Canada was called upon by Britain to provide troops in the Second Boer War (1899–1902), it sent regiments formed from the regular army and even one unit, Lord Strathcona’s Horse, that was recruited and paid for by a private individual, a wealthy Scots-born Canadian fur trader, financier, and railroad investor, Donald Alexander Smith. All told, 7,400 Canadians served in the war, and of these 242 died in combat or from disease. In its first half century of existence as an independent state, Canada relied on the British Royal Navy for maritime protection, but in 1910 Canada’s Parliament passed the Naval Services Act, which created the Royal Canadian Navy. Almost 600,000 Canadians enlisted, and over 400,000 served with distinction on the Western Front in World War I, but of all the dominions in the British Empire, Canada was probably least prepared when hostilities started.

In Latin America, armed violence continued to be an important part of the region’s history after the wars of independence, but much of the fighting took place in connection with civil wars, regional disputes, coups d’état, liberal-conservative conflicts, and power grabs by political strongmen. Such fighting was a symptom of the internal weaknesses of the region’s new states. It also was one of the reasons why international wars in the region were less common and generally less lethal than those in other parts of the world. Even the three largest states—Argentina, Brazil, and Mexico—lacked the resources and inclination to maintain large armies, and no state had the money or sufficient popular

support to carry on large-scale campaigns or protracted conflicts. The international wars that did take place were for the most part fights over territory, especially in the Rio de la Plata region in the south, which was fought over by Brazil, Argentina, Uruguay, and Paraguay, and also on the Pacific coast, which was the scene of two wars in which Chile fought Bolivia and Peru. Mexico’s two major wars were against the United States and France. The longest and most lethal war was the War of the Triple Alliance (1864–1870) in which Paraguay fought for six years against Brazil, Argentina, and Uruguay even after major battlefield defeats, enormous casualties, and great civilian hardship. The decision to persevere was made by Paraguay’s dictator, Francisco Sancho López, who is still celebrated as a national hero in Paraguay but was probably insane toward the war’s end. In terms of significance, the Mexican-American War (1846–1848) was the region’s most important nineteenth-century conflict. Brought about by the U.S. annexation of Texas, which Mexico still viewed as legally theirs despite the Texas Revolution of 1836, the war resulted in a Mexican defeat and the addition of 500,000 square miles of territory to the United States. The last major war of the nineteenth century was the War of the Pacific (1879–1884) in which Chile defeated Peru and Bolivia and solidified its claim as the region’s most powerful state at the cost of only 2,800 killed in action over five years of fighting. After the mid-1880s, violence continued: civil wars took place in Argentina, Chile, Paraguay, Bolivia, Peru, and Ecuador; rulers, including the emperor of Brazil, were overthrown; private armies and brigands destabilized rural areas in Brazil, Central America, and elsewhere; British, German, and Italian warships blockaded Venezuelan ports to force the government to pay its debts; and the United States sent marines into Nicaragua and encouraged rebellion in Panama against Colombia. But there were no more international wars.

The United States between 1783 and 1914 fought international wars against the Barbary States of North Africa, Great Britain, Mexico, Spain, dozens of Indian tribes, and the Republic of the Philippines. The United States also dispatched troops to Cuba, the Dominican Republic, Haiti, Chile, Argentina, Panama,

Nicaragua, and China to protect its political and economic interests. The nation's most deadly war, however, was one in which Americans fought one another, the United States Civil War. In all the other wars the United States fought between the winning of independence and its entry into World War I, it suffered a total of approximately 6,531 combat deaths. In the U.S. Civil War, approximately 7,863 soldiers lost their lives in just three days of fighting at Gettysburg, and a total of approximately 680,000 soldiers died on the battlefield or from disease in four years of fighting.

Given the fact that the United States faced no hemispheric threats, the country maintained a small standing army except in times of actual warfare throughout the nineteenth century. Numbering only 7,000 men at the beginning of the War of 1812, the army increased to 34,000 men during the fighting but then was reduced to 6,000 once the war ended. Before the Mexican-American War the army stood at 8,000 men, reached a peak of 104,000 during the war, and then fell back to around 15,000 in the 1850s. During the American Civil War both sides resorted to conscription, and over three million served, but in 1867 the army was reduced to 25,000, a smaller force per capita than had existed in 1810. Despite its small numbers, efforts were made to maintain the army's professionalism: its troops were supplied with new weapons as military technology changed, and the United States Military Academy at West Point and the Army Corps of Engineers were founded in 1802 and 1821, respectively. Nonetheless, the army did not perform particularly well in the Spanish-American War or the Philippine-American War, leading to a flurry of actions to reorganize, re-equip, and enlarge the army in the opening years of the twentieth century.

Neglected in the immediate aftermath of the U.S. Civil War, the navy gained support in the mid-1880s with the growth of U.S. trade, the rise of imperialism, and the influence of the American naval strategist and educator Albert Thayer Mahan, who in his *The Influence of Seapower on History, 1660–1783*, argued that strong navies made great powers. Between 1883 and 1899 Congress authorized the construction of more than 30 modern warships and in the early 1900s

supported U.S. participation in the worldwide naval arms race by approving funds for the construction of 14 battleships. By 1914 the United States was the world's third-largest naval power, behind Great Britain and Germany.

—James H. Overfield

American-Indian Wars, 1750–1914

Native Americans, colonists, and Europeans fought numerous wars in North America between 1750 and 1914, and although they are often called the Indian Wars, these conflicts differed in causes, participants, and scope. Native Americans fought newcomers in some cases, but in others they allied with French, English, or other warring factions. Native Americans usually made decisions for war or peace as villages, although some individuals acted on their own. Often only a faction of the nation or tribe engaged in a particular war. Many indigenous communities had ongoing feuds with other Native Americans, and these rivalries shaped their relations with the various governments. Land is often considered the primary motive for warfare involving indigenous groups in the United States, but historians increasingly stress local relationships between communities and officials.

France fought Great Britain in the Seven Years' War (the French and Indian War, 1754–1763 in North America, 1756–1763 in Europe), and local allies conducted parallel wars, fighting common enemies, while maintaining considerable autonomy. As in subsequent wars in the eastern United States, combatants often directly targeted communities and ambushed opponents. European troops without Native American auxiliaries were vulnerable while marching in the woods. During this larger war, Cherokees attacked Virginia and South Carolina because colonists continued to squat on their land. In 1763 France surrendered its empire in North America to the British with the exception of Louisiana, which was given to Spain. Many Native Americans asserted that France could not transfer its claims to Great Britain and, aggravated by a host of other grievances, began Pontiac's War against the British around the Great Lakes in 1763. Although little fighting occurred after the first year

► PONTIAC'S WAR

As the Seven Years' War ended, many Native Americans around the Great Lakes remained hostile to the British because the conflict had not settled their grievances. Many resented their recent treatment. Furthermore, the irritant of British squatters remained, and for at least a generation Native American prophets had urged them to abandon European connections and ways. Before the official European peace, the British withheld presents they had formerly given to maintain favor, occupied French forts against some locals' wishes, and assumed that former French claims over Native American lands were subsequently conveyed to the British. On May 9, 1763, an Ottawa chief, Pontiac, and his allies attacked Fort Detroit. Others captured forts Sandusky, Miami, St. Joseph,

Ouatenon, Michilimackinac, Venango, Le Boeuf, and Presque Isle. But forts at Detroit, Pitt, Ligonier, and Bedford survived sieges, while Niagara was not directly attacked. Native Americans killed about 2,000 colonists, and in December retaliatory mobs of colonists killed peaceful Conestogas in Pennsylvania. Fighting lulled that winter, and British officials reached understandings with some friendly chiefs in 1764 and 1765. Pontiac's War was the first significant multiracial conflict in which Native Americans forced Britain to accommodation. However, despite renewed British concessions, major grievances remained, and many Native Americans were still openly hostile. Fighting resumed with the American Revolutionary War.

—Glenn Walker

and British officials continued to placate many chiefs, rumblings of war in the region continued.

Native Americans fought on both sides in the American Revolution. Factions of the Six Nations (or Iroquois), who lived south of Lake Ontario, were allied with the Patriots and fought other Iroquois who were aligned with the British. Overall, more Native Americans aided the Crown than the rebels during the American Revolution and had not been subdued by the end of the war. In 1783 the British Crown surrendered its American claims south of the Great Lakes and west to the Mississippi. The new U.S. government engineered several treaties that would not have been binding by the standards of a contract or an international diplomatic agreement with Native Americans in western New York and Ohio. Many chiefs denounced these treaties, but the United States defeated their confederacy at the Battle of Fallen Timbers in 1794 during the Northwest Indian War. The United States then forced them to cede significant tracts around the Ohio River.

In the nineteenth century the United States fought many wars to dispossess Native Americans. President Andrew Jackson's Removal Act in 1830 forced groups of Indians to migrate west of the Mississippi. The Cherokees resisted

Aftermath of the Wounded Knee Massacre at the Pine Ridge Agency in South Dakota, 1890. The massacre, in which 150 Sioux were killed and 50 wounded, marked the end of 400 years of organized Indian resistance to white culture. (Library of Congress)

by taking the government to court but were forced from their homes at bayonet point. Factions of the neighboring Creeks and Seminoles in Florida fought a bitter irregular war, prompting the United States in 1842 to concede the remaining Seminoles' right to stay. Defeat in the

INDIAN CESSION OF LANDS IN THE UNITED STATES

1832 Blackhawk War pushed Sauks and Foxes out of Illinois and Wisconsin. By the 1830s some Americans already lived beyond the Mississippi, and steady infiltration of Native American lands caused wars farther west, including the Rogue River War (1855–1856), the Apache and Navajo War (1860–1868), the Modoc War (1872–1873), the Apache War (1876–1886), the Nez Perce War (1877), the Ute War (1879), and the Sioux Wars (1862, 1876–1877, and 1890–1891). A massacre of Lakotas at Wounded Knee in 1890 is often called the end of the Indian Wars and the closing of the American frontier, although violence continued.

These wars were disastrous for many people. Civilians were targets as much as warriors, thousands died, villages were burned or looted, and economies were uprooted. Removal forced Native American communities to start anew in unfamiliar surroundings at enormous human cost. About 20–25 percent of the Cherokees died in captivity or on the Trail of Tears, a forced

march west to Oklahoma. By seizing their land and imposing a system of reservations, the United States assumed a degree of responsibility over Native Americans' lives. Despite sincere efforts of many Americans and Europeans to improve Native Americans' lives, the results were often unsatisfactory. Almost always, attempts to help indigenous groups live as Americans fell far short of giving an equal degree of material prosperity. Many Native Americans continued to value their cultural practices and questioned whether they wanted to learn American ways.

French and Indian War

The conflict known in the United States as the French and Indian War was part of a global struggle between France and England (the Seven Years' War) that also was fought in Europe, India, Africa, and the Philippines. In North America the war was caused by conflicting French and British claims to the Ohio Country, a territory that stretched westward from the Appalachians to the Mississippi River and from the Great Lakes to the Gulf of Mexico. Fighting lasted from 1755 to 1763, with war officially declared in May 1763. Native Americans fought for both sides but mainly for the French. The war was catastrophic for France, which ceded to Great Britain all of North America east of the Mississippi, including Nova Scotia and Canada. However, Britain's victory paradoxically led to new strains between the London government and the 13 colonies, escalating tensions that would ignite the U.S. War for Independence.

The war was initiated by a series of clashes in the Ohio River valley between French forces and Virginians. The Virginians sought to dislodge the French from Fort Duquesne, the site of present-day Pittsburgh, in order to open up the territory to British settlement and enrich land speculators. When their efforts failed, Britain committed itself to a large-scale war in 1754 and

sent a sizable army to North America under the command of General George Braddock.

The French dominated the opening stages of the war. As early as 1754, a young George Washington distinguished himself in an unsuccessful attempt to capture Fort Duquesne. In July 1755, a force of 1,400 British regulars under Braddock was ambushed and routed by the French and their Indian allies. British casualties were heavy, and Braddock himself was killed. The Ohio Valley Indians, concerned with the growing threat of settlements, used Braddock's defeat as an opportunity to strike English settlements the following year. In August 1756 a French and Indian force captured Fort Oswego on Lake Ontario; in 1757 they took Fort William Henry, situated at the foot of New York's Lake George. The French were unable to stop the subsequent massacre by their Indian allies of the British garrison as its soldiers marched out of the fort, despite assurances of honorable treatment as prisoners of war.

The 1757 appointment of William Pitt to lead the war effort as secretary of state was the turning point in the war. One of Pitt's first steps was to dispatch to North America 20,000 regular troops. Combined with colonial militias, this created a fighting force of 50,000 men. He placed them under the command of new able generals and instituted a stronger policy regarding the employment of Indian allies. Here, the

► THE DEATH OF GENERAL WOLFE

This painting by Benjamin West commemorates the epic Battle of Quebec that resulted in the surrender of Quebec by French forces. Both General James Wolfe and his French adversary, General Louis-Joseph de Montcalm, perished on the Plains of Abraham. West's painting depicts Wolfe as a Christ-like martyr who died to free America from French tyranny.

The death of General James Wolfe at Quebec during the French and Indian War. Painting by Benjamin West, 1769. (Library of Congress)

BRITISH NORTH AMERICA AFTER THE TREATY OF PARIS (1763)

tireless efforts of Sir William Johnson to convince the Iroquois to remain neutral at last bore fruit. The Iroquois, in turn, persuaded the Delaware to cease warfare against the British.

During the summer of 1758 a British force failed to take Fort Ticonderoga (Fort Carillon to the French), but that failure was offset by the capture of Louisbourg, on Cape Breton Island in Nova Scotia, and Fort Frontenac, located in present-day Kingston, Ontario. British fortunes also improved in the south, where General John Forbes managed to enlist strong Indian support to capture Fort Duquesne. In return, the British provided certain financial considerations and promised to withdraw from the Ohio River country. Surrounded and unable to be supplied, the French abandoned Fort Duquesne, which Forbes occupied and renamed Fort Pitt.

In 1759, British regulars and Iroquois allies took Fort Niagara. Sensing the vulnerability of their position, the French abandoned Fort Carillon (Ticonderoga) and Crown Point and withdrew to Canada. In September, British general James Wolfe's defeat of the French army, commanded by Louis-Joseph de Montcalm, on the Plains of Abraham resulted in the surrender of Quebec. The deaths of the two generals, Wolfe and Montcalm, made this one of the epic battles of history.

In 1760, the British took Montreal and forced the French governor to surrender the whole of New France. This victory essentially marked the end of the French and Indian War, although fighting continued on other fronts until the Treaty of Paris, signed in 1763, officially ended the Seven Years' War. Britain was now the world's leading imperial power, although within just two decades it would lose its 13 American colonies after its defeat in the American Revolution.

American Revolution— Military Campaigns

When American rebels fired upon British soldiers on April 19, 1775, in what became known as the Battles of Lexington and Concord, British authorities decided to crush the rebels using armed force. British strategy was fourfold. It involved isolating the New England colonies by seizing the line of the Hudson River northward to Lake Champlain; isolating the central colonies, the main food-producing region, by occupying the line of the Chesapeake Bay and lower Susquehanna River; controlling the southern colonies by capturing Charleston and Georgetown, South Carolina, and holding the line of the Santee River; and blockading the coast to stop weapons and supply flows. Ultimately, disagreement over and resistance to the strategy meant that the British would fail to exercise sufficient military power, even after hiring some 30,000 German mercenaries (Hessians).

The war's first phase involved the siege of Boston by the British. Rebels flocked to Boston, digging trenches and fortifying artillery sites on Breed's Hill. Though the British successfully captured the hillside in the Battle of Bunker Hill on June 17, 1775, they suffered heavy losses. On July 2, 1775, George Washington assumed command of the newly inaugurated Continental Army. As the army consisted of militia with brief terms of service, Washington had to spend the remainder of the year raising and training a new patriot army. The rebel army's defensive efforts were bolstered when Colonel Henry Knox transported artillery captured at Fort Ticonderoga to Boston. Thereafter, Boston would remain in rebel hands.

Meanwhile, General Richard Montgomery and Colonel Benedict Arnold led a two-pronged American invasion of Canada. American political leaders mistakenly believed that the Canadians would happily shed their allegiance to England. The Americans seized Montreal on November 13, 1775, and attacked Quebec on December 30, 1775, but lacked the strength to capture it. In the spring, British reinforcements quelled the invasion.

In 1776 British General Henry Clinton's first attempt to capture Charleston, South Carolina, failed. Thereafter, in August, General William

➤ GEORGE WASHINGTON CROSSING THE DELAWARE

Memorialized in this famous painting by Emanuel Leutze, George Washington crosses the Delaware River to attack the British in Trenton, New Jersey, in December 1776. One of the oarsmen shown battling the massive chunks of ice is an African American believed to be Prince Whipple, a slave who was emancipated during the war and a bodyguard to Gen. (Bettman/Corbis)

Howe began a campaign to capture New York City. During this campaign, Howe outmaneuvered the inexperienced Washington, and well-trained British soldiers proved superior to the poorly trained rebels. By November, the British were chasing Washington's army through New Jersey. With his army about to dissolve because its terms of enlistment were ending, Washington decided to launch an offensive. Washington's army crossed the Delaware River on Christmas Eve and defeated the Hessians at Trenton, which galvanized the struggling rebel forces.

In 1777, a British force invaded through Canada led by General John Burgoyne. Meanwhile, Howe's army marched on Philadelphia. Burgoyne's army captured Fort Ticonderoga and continued to the Hudson River near Albany, New York. However, the challenge of coordinating columns separated by miles of wilderness and controlled from London would unravel the British campaign. Burgoyne erroneously thought that Howe would advance from New York to help him. Desperate for supplies, Burgoyne sent

a column toward Bennington, Vermont, where it was defeated. Burgoyne persisted toward Albany but was defeated and forced to surrender to a larger American army (led by General Horatio Gates) in two battles around Saratoga, New York. Saratoga was a turning point in the war because France allied with the rebel cause and enabled an otherwise uncertain victory.

While the rebels were winning in the north, Washington suffered more setbacks around Philadelphia. The British drove the Americans from their capital into bleak winter quarters at Valley Forge, where they suffered from hunger and disease. Yet organizational and administrative improvements, the inculcation of drill and discipline by Baron von Steuben, and Washington's iron will strengthened the Continental Army as it emerged from winter quarters in 1778.

Meanwhile, Howe's replacement, General Henry Clinton, elected to abandon Philadelphia and retreat to New York. By July, both armies had returned to roughly the same positions that they had occupied two years earlier. For the remainder of the war there were no more significant battles north of the Potomac River.

Unable to achieve decisive results in the north, the British focused on the southern colonies, believing that many American southerners were Tories (British loyalists). In December 1778, the British captured Savannah. The following October, a combined American and French force tried unsuccessfully to recapture it due to problems in coordinating American land forces with the French navy and army. Still, the presence of a French fleet in North American waters restrained British operations.

In January 1780, Clinton and General Charles Cornwallis directed a campaign against Charleston, South Carolina, resulting in the largest surrender of American troops during the entire war. Cornwallis rapidly exploited this victory. Meanwhile, Congress handed over command in the south to Gates. However, Gates's army was routed at the Battle of Camden on August 16, 1780. Cornwallis aggressively tried to occupy numerous important posts throughout the Carolinas. Yet one of his detachments became separated from his main army and was annihilated at the Battle of Kings Mountain on October 7, 1780, the turning point in the south.

For the remainder of the war, rebels and Tories fought a brutal civil war in the south. Gates's replacement, General Nathanael Greene, kept the small Continental Army alive. Cornwallis lacked the strength both to defeat Greene and control the countryside. Because he could not offer security to the Tories, they did not fight as vigorously as British strategists had hoped.

Thwarted in the south, Cornwallis marched north to Virginia. Meanwhile, a French army commanded by Count Rochambeau had joined Washington in White Plains, New York. When Washington learned that the French fleet would appear in the Chesapeake Bay, he conceived the daring strategy to bypass Clinton in New York and trap Cornwallis in Virginia. In the war's decisive naval engagement, the French fleet prevented the British fleet from helping Cornwallis. After about a three-week siege, on October 19, 1781, Cornwallis surrendered at Yorktown, thus virtually ending the war for American independence.

War of 1812

The Anglo-American War (1812–1815), commonly known as the War of 1812, was triggered by a long series of outstanding grievances between Britain and the United States, which were largely connected with the former's contemporaneous war against Napoleonic France. From the American perspective, Britain's insatiable demand for sailors to man the Royal Navy had

for years led to the impressment of American seamen. Further, American neutral vessels attempting to trade with the European continent—largely controlled by Britain's rival, France—had led British vessels to seize such ships on the dubious basis that their cargoes fell under the loose British definition of contraband. American motives were not, however, entirely blameless. Many in the United States sought expansion into British Canada and refused to allow the repatriation of Royal Navy sailors who had deserted and enlisted aboard American merchant vessels with papers claiming American citizenship.

War commenced in June 1812 when a small American militia force of 2,500 men under General William Hull briefly crossed the Canadian border and were held back by an equally small British force. Hull then withdrew to Detroit. A British and Indian force then crossed the frontier, took Fort Dearborn (now Chicago) on August 15, and captured Hull's force. The Americans launched a second invasion of Canada but in October were defeated along the Niagara

➤ "THE STAR-SPANGLED BANNER"

On September 13, 1814, Francis Scott Key, who was on a flag-of-truce ship in the Baltimore Harbor, watched as English ships bombarded Fort McHenry well into the night. When morning came, Key was overcome with joy to see the American flag, seemingly untouched, still flying gallantly above the battered fort. Unknown to Key, before dawn soldiers had taken down the tattered flag that had flown during the battle and replaced it with an enormous 30- by 42-foot (13-meter) flag with 15 stars and 15 stripes. Key wrote a poem commemorating the event entitled "The Defense of Fort M'Henry" that became enormously popular and was set to the tune of an English drinking song, "To Anacreon in Heaven." The song became known as "The Star-Spangled Banner." Though it did not become the U.S. national anthem until 1931, the army and navy had started using it as their anthem in the 1890s. Furthermore, at the first modern Olympic Games in Athens in 1896, when American James Connolly won the triple jump and became the first man ever to receive an Olympic gold medal, it was the "The Star-Spangled Banner" that played as the U.S. flag was raised.

SOUTHERN THEATER OF OPERATIONS, WAR OF 1812

River at Queenston Heights. Approximately 1,600 American troops captured and set fire to York (now Toronto) in April 1813, but these forces under General Pike were later driven off at Stony Creek on June 6.

In the autumn, General William Henry Harrison crossed Lake Erie with 7,000 American troops, in the wake of the defeat of an opposing

naval flotilla on September 10, and forced British General Proctor from Detroit on September 29. In the follow-up action at the Thames River on October 5, Proctor was again defeated. Meanwhile, with the British having failed in their amphibious attack in May on Sackett's Harbor on Lake Ontario, the Americans launched a new offensive under General James Wilkinson, who

hoped to take Montreal. This attempt, and attacks elsewhere, failed, and at year's end the British captured Fort Niagara.

From the opening of hostilities, the British Royal Navy had continued its blockade of the American coastline, causing economic disruption, especially in New England, which had never supported the war. In the summer of 1814, a new American commander, General Jacob Brown, launched another incursion toward Niagara, which took Fort Erie and defeated the British at Chippewa on July 5. At Lundy's Lane on July 25, both sides fought to a standstill before the Americans finally withdrew.

By this time the war in Europe had ended, and British reinforcements began arriving, the majority in the form of an expedition to Chesapeake Bay. General Robert Ross defeated American militia at Bladensburg on August 24, entered Washington the next day, burned its public buildings, and then withdrew, although he failed to take Baltimore near which he was himself killed. At about the same time, a British thrust down Lake Champlain by General George Prevost failed as a result of an American naval victory at Plattsburgh on September 11.

At sea, the tiny American navy, consisting of nothing larger than frigates, acquitted itself remarkably well but was unable to loosen the enemy blockade or prevent amphibious landings, at least not one consisting of 14,000 Peninsular veterans under General Pakenham, which landed in the Mississippi delta on December 13. Neither side was aware that a treaty of peace was concluded in Belgium on Christmas Eve, and when Pakenham's forces needlessly confronted those under Andrew Jackson near New Orleans on January 8, 1815, they were disastrously repulsed. The war ended as a stalemate, with the territorial situation virtually unchanged and, with the Napoleonic Wars over, impressment a dead issue.

American Civil War

The deadliest conflict in U.S. history, the American Civil War pitted the Union against the Confederate States of America. Determined to perpetuate slavery, the South claimed independence so that it would be master of its own affairs. The North initially fought only to preserve the United States, but as the war widened in scope President Abraham Lincoln in 1862 declared an end to slavery in the states still in rebellion, transforming the war into a crusade to abolish slavery. Northern victory gave slaves their freedom, though they faced racism and discrimination in the postwar South, where most of them continued to live.

Unable to resolve their dispute over slavery, the Union and the Confederacy went to war on April 12, 1861, when Confederate artillery attacked the Union garrison at Fort Sumter, South Carolina. From the outset the Union had demographic and economic advantages. Its population of 20 million more than doubled the South's 9 million, only 5.5 million of whom were white. The Northern states generated three-quarters of America's wealth. Seventy percent of railroads were in the North, which in 1860 had 110,000 factories to only 18,000 in the South. Northern states produced 97 percent of America's firearms, 81 percent of its wheat, and two-thirds of its corn.

Southern leaders did not expect the war to last long enough for these advantages to be significant. They believed that the South would need only to fight a defensive war, whereas the North would need to invade the South and conquer territory. Indeed, in this view the South did not need to win any victories but instead only

THE GETTYSBURG ADDRESS

President Abraham Lincoln delivered this famous speech on November 19, 1863, during a ceremony to dedicate a cemetery built for the fallen soldiers of the Battle of Gettysburg fought in July 1862. The entire text of this speech is provided below.

“Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battle-field of that war. We have come to dedicate a portion of that field, as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

But, in a larger sense, we can not dedicate—we can not consecrate—we can not hallow—this ground. The brave men, living and dead, who struggled here, have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember what we say here, but it can never forget what they did here. It is for us the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.”

—*Christopher Cumo*

needed to maintain an army in the field. Moreover, the Confederacy assumed that its cotton crop would bring Britain, whose textile mills depended on foreign cotton, to its aid. Others, convinced of the superiority of Confederate army officers and soldiers, called for a more aggressive strategy. The Confederate president Jefferson Davis ultimately decided on a synthesis, which he called an “offensive-defensive” strategy, in which

Southern forces were dispersed across the South to defend the homeland but would use interior lines of communication to concentrate forces in case of a Northern invasion; it also would seize opportunities to go on the offensive, even invading the North if conditions were favorable.

A hero of the Mexican-American War, Union general-in-chief Winfield Scott devised what came to be known as the Anaconda Plan to defeat the South. First, knowing that the Confederacy depended on imports of machinery and armaments, Scott counseled Lincoln to blockade the Southern coastline. Second, Scott recommended that the Union gain control of the Mississippi River, thus dividing the Confederacy in two. Scott also counseled patience. Believing that support for the Confederacy was tepid and that secessionists were in the minority, he envisioned support for the war withering away. Lincoln agreed with the first two points of the Anaconda Plan, but knowing that the Confederate government would gain legitimacy the longer it lasted, he did not wish to delay action. He ordered a thrust toward Richmond, Virginia, the Confederate capital. In 1861 and 1862 Confederate forces repulsed Union invaders as they advanced toward Richmond. Emboldened by his success against Union commanders, Confederate general Robert E. Lee invaded Maryland in 1862, only to lose that September at Antietam, a ghastly battle that counted 5,000 dead and 20,000 wounded.

In the Western theater, where Union forces were to take control of the Mississippi River, General Ulysses S. Grant rose to prominence, capturing Fort Henry on the Tennessee River and Fort Donelson on the Cumberland River in February 1862. A surprise attack at Shiloh in April 1862, however, nearly cost Grant his army. The Union counted more than 13,000 casualties and the South more than 10,000. These losses from a single engagement exceeded the total casualties from the War of Independence, the War of 1812, and the Mexican-American War. As in the East, in the spring of 1862 neither side could claim a decisive victory.

As the war lengthened, finding ways to finance it became critical. Each side taxed its citizens. By war's end the North derived 21 percent of its budget from taxation, whereas the South derived only 1 percent. Both sides also raised

money by selling war bonds. The North sold \$2 billion of bonds by war's end. Southerners, fearing that bonds would be worthless if the South lost, were less eager to buy bonds. Both North and South printed paper currency to supplement taxes and the sale of bonds. In August 1861 the Confederacy printed \$100 million in paper money, and in January 1862 the Union issued \$150 million in greenbacks. The printing of paper money caused inflation. In the North food prices rose 80 percent in 1863, forcing families to go hungry. In Richmond civilians rioted for food, breaking into stores to steal what they could not afford. In New York City civilians rioted for three days in July 1863. Initially rioters protested the draft, but as the riot degenerated into racial conflict, whites lynched blacks. As prices rose, pay fell. Whereas in 1861 the Union government paid seamstresses 17 cents per shirt, in 1865 pay fell to 15 cents per shirt. Private companies paid as little as 8 cents per shirt.

The war made women, whose husbands and sons were in uniform, the managers of farms and workers in factories. In the North, hundreds of women became nurses. Life in the army was no better than civilian life. The single blanket issued to soldiers was not enough to protect against the cold in winter, and the woolen uniforms were hot in summer. Lice-ridden troops suffered from diarrhea and other diseases. In the South some soldiers went barefoot, so short was the Confederacy of necessities. With the desertion rate high and volunteers unwilling to enlist, the South resorted to conscription in March 1862, and the Union followed suit in July 1862. Conscripts totaled only 6 percent of Northern soldiers but nearly one-third of Southern troops.

Initially committed only to preserving the United States, Lincoln in 1862 endowed the war with a greater purpose: freeing the slaves. On September 22, 1862, he issued the Emancipation Proclamation, declaring that slaves in rebellious states would be free on January 1, 1863. The proclamation said nothing about the status of slaves in the border states or in portions of the South already conquered, but at least symbolically it went a long way toward ending slavery in the United States.

As early as 1861 the Union had accepted blacks into the army but only as cooks, laborers,

and carpenters. In 1863, however, the Union began using blacks in combat. By war's end blacks comprised 10 percent of the Union Army. Nevertheless, discrimination remained widespread, and black soldiers were paid less than white soldiers.

After two years of stalemate, in 1863 the Union won two decisive victories. In May 1863 Grant besieged Vicksburg, Mississippi, the last Confederate stronghold on the Mississippi River, prompting Lee to invade Pennsylvania in his quest for a decisive victory. There he lost a three-day battle at Gettysburg. On July 4, 1863, the day after Lee's defeat, Vicksburg fell to Grant. The victory led Lincoln to appoint Grant commander of all Union forces. Waging war against Southern armies and the businesses and farms that supported them, Grant and General William T. Sherman decided to grind down the Confederate armies. The Union armies slaughtered livestock, burned crops, and destroyed railroads.

The war's end came in the spring of 1865, when the Army of Northern Virginia under Robert E. Lee was forced to retreat from Petersburg, Virginia, and abandon its defense of Richmond, two cities that had been fought over for close to a year. On April 9, 1865, Lee surrendered to Grant, and on May 26 the last Confederate troops surrendered. Six hundred thousand soldiers had died in the bloodiest war in U.S. history. Slaves at last won their freedom when the Thirteenth Amendment was adopted on December 6, 1865. The United States had been preserved.

Photography in the American Civil War

The American Civil War was the first war to be documented by photography. Photographers brought the war to Americans with a graphic reality that no other contemporary medium

This photograph, shot by Timothy O'Sullivan in July 1863, captures the casualties on the battleground of Gettysburg. Entitled "A Harvest of Death," it was one of the numerous photographs included in Alexander Gardner's Photographic Sketchbook of the War, published in 1865-1866. With regard to the photograph, Gardner comments, "Such a picture conveys a useful moral: It shows the blank horror and reality of war, in opposition to its pageantry. Here are the dreadful details! Let them aid in preventing such another calamity falling upon the nation." (Library of Congress)

possessed. The demand—from both the public and the military—for views of the war remained steady, at least in the North. Nonetheless, the photographic report was incomplete and had little impact on military strategy.

The main limitation to comprehensive photographic coverage of the war was the technology itself. Equipment was cumbersome and expensive. Long exposure times (10 to 30 seconds) limited photographers to stationary or posed scenes. Furthermore, a photographer working in the field needed a portable darkroom, since after a plate was coated with chemicals and exposed it needed to be rushed to the darkroom while still wet to be developed. Not surprisingly, battle images are virtually nonexistent. Most images were produced days after fighting subsided, showing corpse-strewn fields, shattered buildings, and marred countryside. Moreover, most campaigns went unrecorded, as only theaters of war within fairly easy reach were extensively documented.

Generally, outdoor photography focused on inanimate objects such as buildings, weapons, ships, and camps. In addition, the U.S. Army Medical Department had photographs taken

of extraordinary injuries, medical operations, or peculiar amputations. More than 90 percent of the war images, however, were portraits, either of individuals or groups of soldiers. It is estimated that anywhere from several hundred thousand to over 1 million images were produced during the four-year struggle.

The Civil War provided a great opportunity to enterprising photographers. Some followed the armies, erected tents or makeshift studios next to army camps, and offered to take photographs of soldiers to send home as mementos. Others waited until the war came to their hometowns to offer their services. Although a list compiled by the National Archives identifies some 300 photographers who were approved by the federal military to work in and around encampments, the actual number of photographers documenting the war was considerably larger. Up to 1,500 men and a few women took pictures of the war for the public, the press, and in a few cases the military.

The Confederacy produced the first photographers of the war. After a few months, however, supply shortages curtailed the production of most photographers in the South, resulting in fewer images from their point of view. Among the photographers from the North, the most famous was Mathew Brady, but Alexander Gardner, George N. Barnard, and Timothy O'Sullivan also did important work. A few photographers had semiofficial status by carrying out assignments for the military. Only one photographer, Captain Andrew Joseph Russell, had official status. He held a commission from the Bureau of the U.S. Military Railroad to record engineering problems created by the field activities of the army.

Contemporaries were willing to believe that the images were as "truthful as the records of heaven," as phrased in a catalogue of Brady's photographs. Yet the images seen in galleries or later reproduced as engravings in newspapers might have been carefully staged scenes or at best represented the subjective views of the photographers. Nevertheless, war photography deeply moved Americans and sometimes shocked them, as in the case of Brady's first pictures of battlefield dead. The public would never again be able to shut its eyes to the reality of war.

The Spanish-American War

In 1898 the United States defeated Spain in a four-month war, thus destroying the last remnants of what was once a vast empire. This marked a turning point in American history. The United States emerged as an assertive participant in world affairs, with many consequences within the United States and elsewhere.

The Spanish-American War began in Cuba. There, in 1895, nationalists rebelled. Spain responded with a heavy hand. General Valeriano Weyler, already experienced in suppressing Cuban and Filipino independence movements on behalf of his government, garrisoned the island, forced Cubans into concentration camps, and adopted scorched-earth tactics. Hundreds of thousands died. U.S. newspapers further sensationalized this bleak situation. This reporting

directed Americans' attention to the very real humanitarian crisis and inflamed public opinion over "Spanish barbarism" at the same time, thereby pressuring the United States government to intervene.

The United States had already interposed itself between conservative European powers bent on reconquest and the American republics via the Monroe Doctrine in 1823. No other American state could play this role, although the threat of European intervention remained. However, U.S. motives in Cuba exceeded mere altruism. American investors had much at stake in Cuban sugar, for example. Also, Britain, France, Germany, Japan, and others were busily seizing vast areas of the globe, from Africa to the Pacific Rim. This threatened to exclude the United States from strategic markets and trade routes especially in East Asia, where all eyes had turned. Washington's motives and concerns, then, were complex.

In early 1898 the United States dispatched the armored cruiser USS *Maine* to Havana to project power and to secure American interests. On February 15 the ship exploded and sank, taking the lives of 264 servicemen. Subsequent investigations failed to discover exactly what had happened, although the evidence suggests that spontaneous combustion in the coal bunkers started a chain reaction that caused the explosion. Whatever the cause, the *Maine's* unexpected destruction created a *casus belli* in American eyes. Many believed that Spanish treachery explained the incident.

President William McKinley presented the Spanish government with a series of ultimata,

► THE INFLUENCE OF MAHAN ON NAVAL WARFARE

The U.S. Navy easily defeated the decaying and obsolete Spanish naval forces in actions at Manila and Santiago de Cuba. Rear Admiral Alfred Thayer Mahan (1840-1914) partly deserves credit for the navy's rapid growth and modernization. By 1900 it had become the third most-powerful navy in the world.

In 1890 Mahan published *The Influence of Sea Power upon History*. In it he stressed the importance of developing and employing a blue-water navy to patrol strategic sea lines of communica-

tion and to generally project national power abroad, wherever it might have been needed. Before this the U.S. Navy's mission concerned mere coastal defense.

Mahan published several other works on naval warfare. His writings were very influential in their time not only with American leaders like Theodore Roosevelt but also with European leaders like Kaiser Wilhelm II, who decided to launch his own naval program.

—James Lockhart

including a demand that Spain recognize Cuban independence and submit to U.S. mediation. Spain declined. McKinley mobilized U.S. forces; in response, Spain severed relations with Washington. The United States then blockaded Cuba. Official declarations of war followed in April.

The U.S. decisively defeated Spain in quick naval and ground actions in Cuba and the Philippines, another Spanish possession. U.S. forces also seized Puerto Rico. On August 12, 1898, Spain signed an armistice at the White House and withdrew from the Western Hemisphere. Many Latin Americans had watched with conflicting sympathies for both Spain, as their mother culture, and the Cuban nationalists, whose aims they supported. But the easy U.S. victory and the post-war agreements codified in the Treaty of Paris and later the Platt Amendment shocked them.

The United States annexed the Philippines, Guam, and Puerto Rico, and in addition to claiming basing rights at Guantánamo Bay, the American government reserved the right to intervene in Cuban affairs. These and other moves in the Pacific placed the United States in control of a far-reaching series of naval bases and coaling stations that would facilitate American access to East Asian and Latin American markets. A few years later, U.S. construction of the Panama Canal completed this global transportation and communications system.

Thus, the United States had consciously and deliberately assumed an influential role in world affairs by the end of the nineteenth century. The United States claimed the Caribbean Basin as its sphere of influence and asserted its authority over the Philippines. These events marked the beginning of a domestic struggle between internationalists and isolationists—a debate, among other things, over imperialism—that would continue until U.S. entry in the Second World War. And as U.S. power continued to expand, many in Latin America suspected Washington's motives and adopted what would eventually crystallize into full-blown anti-Americanism.

The Mexican War

The war between the United States and Mexico commenced on April 25, 1846, when Mexico attacked American troops along the southern border of Texas. The major causes of the war were the U.S. annexation of Texas (followed by Texas joining the Union in 1845) and the ambition of the United States to expand its territory to the Pacific Ocean, both of which fueled deteriorating Mexican-U.S. relations in the late 1830s and 1840s. The war lasted until 1848 and concluded with the signing of the Treaty of Guadalupe Hidalgo in which Mexico recognized the U.S. annexation of Texas and ceded the territory that presently comprises California and the southwestern United States.

In the 1820s and 1830s U.S. settlers in Mexico's northern province of Texas became increasingly disgruntled with the Mexican government's policies, including its ban on slavery and its efforts to limit further immigration by U.S. citizens. In 1836 the Texans rebelled and, after defeating an army under the Mexican president Antonio López de Santa Anna, proclaimed the Republic of Texas with a constitution that legalized slavery. Although the United States, France, Belgium, and Great Britain recognized Texas as a new republic, Mexico refused to acknowledge Texan independence. In the early 1840s Mexico and the Republic of Texas engaged in bitter frontier fighting, which caused many in the United States to develop an increasingly negative view of the Mexicans and their government.

By the early 1840s, the United States was experiencing expansionist fever. Many in the United States began to speak of Manifest Destiny, the idea that the United States had a divinely inspired mission to expand across the

continent, spreading democracy and freedom. Believers in such a mission, along with supporters of slavery who feared that growing British influence in Texas affairs might lead to abolition, were strong supporters of the annexation of Texas. Expansionism became a major issue in the election of 1844 when James K. Polk, the Democratic candidate, pledged to acquire the Republic of Texas if elected. With the election of Polk, the outgoing administration under the proexpansionist President John Tyler secured a joint resolution of both houses of Congress in favor of Texas annexation. After a period of international intrigue, the Republic of Texas rejected offers of peace from Mexico and mediation from Great Britain and voted to join the Union in December 1845.

December 1845 also marked the arrival of the American diplomat John Slidell in Mexico City to win Mexican recognition of the Rio Grande as the U.S.-Mexican border and to purchase as much Mexican territory in New Mexico and California as possible. When the embassy failed, President Polk sent troops in January 1846 under the command of General Zachary Taylor to the Rio Grande to provoke Mexico. After a small skirmish between Mexican and U.S. troops in April, Polk claimed that the United States had been attacked, and Congress responded with a declaration of war in early May.

U.S. forces coordinated a two-front attack on Mexican territory. General Stephen W. Kearny led a cavalry force, backed up by the U.S. Navy, to invade western Mexico from Fort Leavenworth. Meeting little effective resistance, he won the battles of San Gabriel and La Mesa and took control of San Diego and Los Angeles. In January, Mexican resistance in California ended. Two other forces, one under General John E. Wool and the other under Taylor, were ordered to advance south and occupy the city of Monterrey. After taking the city early in 1847, U.S. forces secured their conquest by repulsing a Mexican army under General Santa Anna at the Battle of Buena Vista in February 1847. In March, President Polk dispatched an army under General Winfield Scott to invade central Mexico. After performing the first major amphibious landing by a U.S. force, Scott took the coastal city of Veracruz and then marched westward to take the

cities of Puebla in May 1847 and Mexico City on September 14, 1847.

On February 2, 1848, the United States and Mexico signed the Treaty of Guadalupe Hidalgo. Among other provisions, it specified that Mexico recognize the Rio Grande as the U.S.-Mexico border and cede to the United States the territory that comprises the present-day states of California, Arizona, New Mexico, Nevada, and Utah as well as portions of Colorado and Wyoming. The United States agreed to give Mexico \$15 million as compensation and assume up to \$3.25 million in Mexican government debts to U.S. citizens.

The U.S. victory intensified the debate on slavery. During the war David Wilmot, a Democratic congressman from Pennsylvania, introduced an amendment that stipulated that any territories gained in the war would not include slavery. A four-year debate on this issue fought along sectional lines resulted in the Compromise of 1850, which admitted California to the Union as a free state and organized the rest of the Mexican cession into two territories, New Mexico and Utah, without restrictions on slavery. Although the compromise averted an immediate crisis, it did little to halt the republic's descent into sectionalism and further bitter conflict over slavery.

The War of the Triple Alliance

The War of the Triple Alliance (also known as the Paraguayan War) was fought between Paraguay and an alliance composed of Brazil, Argentina, and Uruguay between 1864 and 1870. It is known as the bloodiest war in Latin American history. Although its immediate cause was the decision of Paraguay's dictator Francisco Solano López to declare war on Brazil for intervening

The Paraguayan cavalry attacks the combined forces of Brazil, Argentina, and Uruguay during the War of the Triple Alliance, which began in 1865. As a result of the five-year conflict, one of the bloodiest wars in Latin American history, one out of two Paraguayans was killed and Paraguay lost vast amounts of territory to Argentina and Brazil. (Library of Congress)

in a civil war in Uruguay, its deeper origins lie in decades of feuding among the southern cone nations of South America over economic rights, borders, politics, and regional hegemony. Its causes also include the ambitions of the Paraguayan dictator Solano López, who expanded and modernized the Paraguayan military and dreamed of annexing Brazilian territory to give his nation access to an ocean port.

The war's immediate origins date to 1864, when Brazil sent troops into Uruguay to oust the Blanco Party, with ties to Paraguay, and replaced it with the Coronado Party, traditionally sympathetic with Brazil. Angered by the ousting of his Uruguayan political allies as well as by Brazil's support of the new regime, Solano López invaded the Brazilian province of Mato Grosso in November 1864. He declared war on Argentina in March 1865 after Argentina refused to grant safe passage for Paraguayan troops so they could attack the Brazilian province of Rio Grande do Sul. The decision of Uruguay, still ruled by the pro-Brazil Colorado Party, to declare war on Paraguay led to the formation of the Triple Alliance, dedicated to the destruction of the Solano López government and the death of Solano López himself.

At the war's outset Paraguay, as a result of its recent military buildup, had the advantage. Its army numbered around 60,000, compared to 8,500 for Argentina, 2,000 for Uruguay, and 16,000 for Brazil. By late 1865, however, Brazil's naval superiority and the allies' larger population from which to recruit soldiers tilted the balance against Paraguay. Although the allies were fighting a Paraguayan enemy fanatically devoted to its leader and encountered difficulty in taking key Paraguayan forts at Tuyuti, Curuzu, and Curupaity, they gradually wore down Paraguayan resistance until the major cities all had been taken by 1869. For another year, however, Solano López continued to fight a guerrilla war in the mountains northeast of Asunción, where he was killed fleeing the enemy.

Although the exact number of casualties is disputed, it is estimated that Brazil lost 50,000 men, while Argentina lost 1,600 men and Uruguay lost 3,100 men. Paraguay had combined military and civilian losses of 300,000. Paraguay, with a population of 525,000 before the war, in 1871 had a population of only 221,000, 28,000 of whom were men. Furthermore, Paraguay lost 55,000 square miles of territory, mainly to Brazil and Argentina, and experienced extensive industrial and agricultural devastation. The war was also costly for the victors. Brazil and Argentina accrued major debts from British financiers to pay for the war, and these massive debts were not paid off until well into the twentieth century.

War of the Pacific

The War of the Pacific, also known as the Chile-Peruvian War or the Ten Cents War, was fought between Chile and Bolivia (with Peru joining the conflict as an ally of Bolivia) between 1879 and 1883. The war was a result of a long-standing dispute between Chile and Bolivia over the control of part of the Atacama Desert. The dispute over borders in the desert took on new urgency

in the 1840s when rich deposits of guano, a valuable fertilizer, and saltpeter, a key component of gunpowder, were discovered in the region. In 1866 the two nations agreed to set the border at the 24th parallel and share the tax revenues on mineral exports from the region between the 23rd and 25th parallels.

Although the arrangement was modified to Bolivia's benefit in 1874, Bolivia became increasingly dissatisfied with the growing dominance of Chile and Britain over nitrate exports in the region. In 1878 the Bolivian government, under President Hilarión Daza, unilaterally raised taxes on the Chilean companies and, when one of them refused to pay, seized the company and announced that the government would sell it by auction in February 1879 in the city of Antofagasta. When 200 Chilean troops occupied the city to prevent the auction, Bolivia declared war on March 1, 1879, and invoked an earlier secret alliance with Peru. Although committed to honoring its treaty obligations to Bolivia and concerned over Chilean expansion in the region, Peru sought to mediate the dispute but failed. Chile declared war on the two allies in early April 1879, and the war began.

Chile's more professional, less politicized army and modern navy dominated battles on both land and sea. The Chilean navy controlled

the sea after cornering and capturing the Peruvian ironclad *Húascar* at the Battle of Anagamos in October 1879. Although the Peruvians achieved an impressive victory over the Chileans at the Battle of Tarapacá on November 27, 1879, this had no lasting effect on the war's ultimate outcome. By mid-1880 the Chileans had effectively occupied most of Peru. After an unsuccessful mediation effort by the United States to end the war in October, the Chileans occupied the Peruvian capital of Lima in January 1881. Peruvian resistance continued for three more years. The war finally came to an end when Peru and Chile signed the Treaty of Ancón in 1883, and Bolivia and Chile and Bolivia signed a truce in 1884. Chile acquired the province of Tarapacá from Peru and Antofagasta from Bolivia. Bolivia was cut off from the sea, while Chile gained control over nitrate exports. These exports dominated Chile's economy until the 1920s and would transform Chile into the dominant power in the region.

■ Introduction: International Cooperation, Pacifism, and Peace Movements

Internationalism is the idea that nations should cooperate to solve common problems and prevent national disputes rather than pursue primarily their national interests. Internationalism became an increasingly strong ideology as the nineteenth century progressed and has become a dominant ideology of the twentieth century. Modern internationalism traces its roots to the eighteenth-century Enlightenment, when thinkers such as Immanuel Kant (1724–1804), Voltaire (1694–1778), and Jean-Jacques Rousseau (1712–1778) argued for the universalism of human values and interests. Kant, in his

Perpetual Peace: A Philosophical Sketch (1795), even envisioned a form of world government. Romantic nationalism, which emerged in the early nineteenth century as a reaction to the materialism of many Enlightenment thinkers, also played a role in advancing internationalism. Following the French Revolution, Greeks, Belgians, Italians, Poles, Czechs, Hungarians, and Germans all sought to form their own nation-states, in which a single ethnic population would have its own state. The widespread revolutions of 1848, however, also reflected a broad international desire for nationalism. These movements, many of

which eventually succeeded as the nineteenth century wore on, helped create a larger community of nations, which eventually became the basis for an international community.

Conflicts between and among nations were common, but so too was a desire to cooperate and preserve peace. These were the goals of the Concert of Europe, the agreement struck among the victorious powers after the Napoleonic Wars to regularly consult each other on issues of perceived common interest. They also were the goals of the new international organizations that began to form in the 1860s and 1870s, including the Universal Postal Union and the International Telegraph Union.

Internationalism also gained strength below the state level. International organizations such as the International Olympic Committee and the International Red Cross, the latter formed in 1864 through the inspiration of the Swiss doctor Jean Henri Dunant, were private organizations that, although they worked with national governments, reflected a spirit of individual amity. Working people also embraced internationalism as a new and potentially revolutionary ideology. The First International, also known as the International Working Men's Association, was founded in London in 1864 under the leadership of Karl Marx. Its aim was an international socialist revolution, and it worked to generate cooperation between socialist groups in different nations. The First International attracted both communist and non-communist socialist organizations, but it eventually split apart over the question of whether revolution was a short- or long-term goal, a division mirrored in the personal animosity between Marx and Mikael Bakunin (1814–1876), the Russian anarchist and fellow leading international socialist. The Second International was formed in Paris in 1889 and pursued more reformist goals. It broke apart in 1914 over the war, with members choosing nationalism over internationalist goals. Before then, however, international socialism represented a major ideological challenge to imperialism during the half century before World War I.

Internationalism also entailed the unprecedented increase in trade and social interaction that especially marked the period from 1870 to 1914. The period witnessed a marked rise in

international cooperation and investment. The British writer and Labour Party member of Parliament Norman Angell, reflecting the temper of the age, wrote in his 1910 book *The Great Illusion* that any future war, regardless of who won, would in fact harm all participants through the damage it would cause to international trade. In the same spirit, European nations pledged support for international cooperation at The Hague Conferences of 1899 and 1907, inspired by the Russian tsar Nicholas II.

Internationalism, however, remained stronger as an ideal than as a reality. National rivalries remained and were particularly intense regarding imperial competition in Africa and Asia, economic protectionism, and arms production. Internationalism also remained largely a European idea. The United States remained largely isolationist, while much of the rest of the world was excluded because of unequal economic development and colonial paternalism. Nonetheless, although World War I proved a serious setback for internationalism, the idea reemerged after the war in the form of the League of Nations.

—Daniel Gorman

Congress of Vienna

The Congress of Vienna was an international meeting of European leaders to redraw the map of Europe after the defeat of Napoleon. In September 1814 representatives of virtually all European states and those of a number that had passed out of existence began gathering at Vienna for one of the important diplomatic assemblies of modern times. Two emperors—Alexander I of Russia and Francis I of Austria—were present along with the kings of Prussia, Bavaria, Württemberg, and Denmark. However, the real work of the congress was carried out by their first ministers, although Tsar Alexander retained full authority. The key players were Count Klemens von Metternich of Austria; Robert Stewart, Viscount Castlereagh of Britain; King Frederick William III of Prussia and his chief minister Prince Karl August von Hardenburg; and Charles Maurice de Talleyrand-Périgord, the representative of King Louis XVIII of France.

A serious split soon developed between Austria and Britain on the one side and Prussia and

EUROPE IN 1815

Russia on the other. Russia sought all Poland in a reconstituted Kingdom of Poland with Alexander as its ruler, while Prussia, supported by Russia, wanted all Saxony. Austria, Britain, and France, fearful of the increase in Russian and Prussian influence, opposed such a plan and in January 1815 at the suggestion of Talleyrand formed a defensive alliance. News of the alliance along with Napoleon's return to France from exile on Elba in March 1815 caused the allies to compose their differences. Russia and Prussia backed down,

and in the ensuing compromise approved in May, Prussia received two-fifths of Saxony, and a new Polish state (Congress Poland) was created with much the same territory as Napoleon's former Grand Duchy of Warsaw, with Tsar Alexander as its king. The result was that Russian influence advanced 250 miles (400 kilometers) farther west.

In the Act of the Congress of Vienna of June 8, 1815, Austria received Lombardy and Venetia, the Illyrian Provinces (former French kingdoms

of Illyria and Dalmatia), and Salzburg and the Tyrol (Tirol), both from Bavaria. Austria, however, gave up the Austrian Netherlands. Prussia secured about two-fifths of Saxony, Posen and Danzig (Gdansk), Swedish Pomerania and Rügen (for which Denmark received Lauenburg). Prussia also gained additional territory in Westphalia as well as Neuchâtel. In return Prussia gave up Ansbach and Baireuth to Bavaria, East Friesland to Hanover, and part of its Polish territory before 1807 to Russia.

In order to offset any future French threat to the northeast, the Dutch Republic was awarded the former Austrian Netherlands (Belgium), with the new enlarged state called the Kingdom of the Netherlands. Metternich also hoped that this step would enhance the possibility of future cooperation between France and Austria. The Kingdom of the Netherlands was, however, characterized by strong religious and linguistic difficulties.

One of the most difficult problems to resolve at Vienna was that of the Germanies, where Napoleon had consolidated some 350 German states into a tenth that number. German nationalism, so evident in the German War of Liberation of 1813, was deliberately set aside in favor of a loose-knit German Confederation of 39 states, including 5 free cities, with Austria as its president. The Act of Confederation was signed on September 8, 1815.

Russia secured most of the Grand Duchy of Warsaw, established as the Kingdom of Poland with the Russian tsar as its king. Tsar Alexander granted Poland a liberal constitution (which Russia did not have), with Polish as the official language and with its own army. Cracow (Krakow) became a free state under the protection of Russia, Austria, and Prussia.

Sweden gained Norway, acquired in the Treaty of Kiel of January 14, 1814, with Norway receiving a guarantee of its rights and a separate constitution. In the Act of Union of 1815 Norway was confirmed as an independent kingdom, merely united with Sweden under the same ruler. Denmark was compensated by receiving Lauenburg, while Switzerland was reconstituted as an independent confederation of 22 cantons. Spain, Sardinia (which received Genoa),

Tuscany, Modena, and the Papal States were all reconstituted. The duchies of Parma, Modena, Lucca, and Tuscany were given to members of the Habsburg family. The Bourbons were not reestablished in the Kingdom of Naples until 1815 (then the Kingdom of the Two Sicilies), since its king, former Napoleonic marshal Joachim Murat, deserted Napoleon. In Italy as in Germany nationalism was deliberately stymied, with Habsburg predominance reestablished. Although the Congress of Vienna preserved a balance of power in Europe, it failed to check revolutionary sentiment throughout Europe.

Holy Alliance and the Concert of Europe

The Holy Alliance refers to a compact created by the Russian emperor Alexander I (r. 1801–1825) and signed on September 26, 1815, by Francis I of Austria and Frederick William III of Prussia. The compact called on the signatories to rule according to the Christian principles of love, justice, and mercy and called for mutual assistance among the three monarchs. The alliance affirmed that the Romanov, Hohenzollern, and Habsburg dynasties ruled by divine right and therefore shared a common interest in defending the territorial governments and autocratic rule of other European empires. All three monarchies utilized the religious arguments of the treaty to justify assisting the repression of nationalist and liberal movements within the signatory empires, but the religious principles of the Holy Alliance were largely abandoned after the death of Alexander I. The 1814 Quadruple Alliance among Great Britain, Prussia, Austria, and Russia proved to be more effective than the Holy Alliance, incorporating France in 1818 to form

the Quintuple Alliance during the Congress of Aix-la-Chapelle. The Great Powers would meet on three subsequent occasions—at the Congress of Troppau in 1820, the Congress of Laibach in 1821, and the Congress of Verona in 1822—but disagreements among the signatories undermined the alliance.

One of the main causes of the failure of the Holy Alliance and the Quintuple Alliance was the different systems of government among the signatories. Although Alexander invited Great Britain to join the Holy Alliance at its inception, the future King George IV argued that the nature of the treaty was incompatible with British parliamentary government. Prime Minister Viscount Robert Castlereagh, British emissary to the Congress of Vienna, privately mocked the religious basis of the treaty, calling it “a piece of sublime mysticism and nonsense.” While Great Britain did not maintain an enduring alliance with the more repressive regimes in central and eastern Europe, it often appeared unwilling to challenge Prussian, Austrian, and Russian policies elsewhere in Europe. The Polish nationalists never received the British support that they expected, and Great Britain never condemned the Habsburg empire’s use of Russian troops to suppress the Hungarian rebellions of 1848. France experienced numerous changes of government during the same period with the overthrow of the legitimist Bourbons in 1830 and the Orleans monarchy in 1848, resulting in a focus on internal affairs and its own borders instead of broader European intervention.

The Congress System collapsed in the mid-nineteenth century because Prussia and the Habsburg empire feared that Russian expansion into the Slavic provinces of the crumbling Ottoman empire would undermine their own interests in the region. These tensions eventually erupted in the Crimean War. During this conflict the Habsburg empire occupied the Danube territories that Russia sought to include within its own dominions. The Habsburg dynasty faced future domestic rebellions without the assistance of Russian military personnel.

The Concert of Europe emerged from the same series of congresses that fostered the Holy Alliance, the Quadruple Alliance, and the Quintuple

PHILOSOPHICAL ANTECEDENTS TO THE HOLY ALLIANCE

Alexander I was not the only prominent figure of the early nineteenth century to suggest that the European balance of power should be maintained through adherence to religious principles. Royalist writer François René de Chateaubriand, one of the critics of Napoleon Bonaparte, argued in his work *Génie du Christianisme* that a close relationship between politics and religion was the only means of preventing future outbreaks of European hostilities. German philosopher and theologian Franz von Baader shared Chateaubriand’s views, arguing that God should be treated not as an abstract concept but rather as a dynamic force in human activities.

—Carolyn Harris

Alliance in the immediate aftermath of the Napoleonic Wars. The terms of the Second Treaty of Paris, signed on November 20, 1815, provided the foundation for a new political order, which recognized the conditions of post-Napoleonic Europe. The treaty recognized that while France was no longer a major military power, the current political leadership of France and the smaller nations at its borders were essential to the political stability of Europe. The concert established buffer states at France’s borders to prevent French expansion and attempted to maintain the security of these states while reintegrating France into this broader diplomatic consensus.

In the years immediately following the Congress of Vienna, the Concert of Europe addressed the security needs of both the Great Powers and small powers, creating an accord in which the smaller powers accepted the general hegemony of the Great Powers in exchange for guarantees of their independence and internal autonomy. Although conflicts occurred among the Great Powers during the nineteenth century, most significantly the Crimean War, the understanding among the signatory powers of the Congress of Vienna provided the foundation for a period of relative stability in Europe, which lasted until the 1914 outbreak of the First World War.

The Hague Peace Conferences of 1899 and 1907

The Hague Peace Conferences of 1899 and 1907 were unique events that witnessed the gathering of the world's leading dignitaries and diplomats to discuss and negotiate fundamental international issues including disarmament, the

regulation of warfare, and arbitration. The general aim of the conferences was to develop strategies to avoid or mitigate war and conflict. The conferences inaugurated an era of multilateral discussions and agreements, which became integral to international relations in the twentieth and twenty-first centuries. The conferences also established key international laws of warfare and neutrality, known as The Hague Conventions, as well as regulations for international arbitration. As a result of the 1899 conference, the Permanent Court of Arbitration, an institution dedicated to conflict resolution, was established. In 1913 it was housed in the Hague Peace Palace, which was built for this purpose.

Inspired in part by a growing worldwide peace movement and fears of the impact of industrialization on the conduct of war, the young Tsar Nicholas II of Russia publicly invited the world to a conference in 1898 to discuss limitations on armaments production. Nicholas

THE PEACE PALACE IN THE HAGUE

At the end of the First Hague Peace Conference in 1899, the need for a building to house the newly established Permanent Court of Arbitration became apparent. Andrew Carnegie, the Scottish-American philanthropist, donated US \$1.5 million for a palace of peace, including an extensive international law library, to be situated in The Hague. The Peace Palace represents the first effort to erect a building dedicated to the foundation of peace through international law. It remains a living museum, not only a historical location for peaceful endeavors of the past but also a functioning institution for the alleviation of conflict and the administration of international law. The French architect Louis Cordonnier designed the palace after winning an international competition in 1906, although his grand design was simplified before construction began. The first stone was laid during the Second Hague Peace Conference in 1907, and the building was completed in 1913. Its gardens were planned by renowned English landscape architect Thomas Mawson. The construction process was an international cooperative enterprise, and the palace's interior and exterior incorporate gifts from around

Peace Palace at the Hague, about 1910. (Library of Congress)

the world. Aside from the Permanent Court of Arbitration, the palace houses a world-renowned international law library and academy and, since 1923, the International Court of Justice, today administered by the United Nations.

—Maartje Abbenhuis-Ash

It's manifesto urged a halt in the acquisition of massive arsenals by all nations for fear that they would push each other into a devastating war. The manifesto surprised most observers. While international peace groups and agitators were wild with hope, most diplomats and government officials were distrustful of the usefulness of the enterprise and cynical of the tsar's motivations. Russia was a large and powerful state but had not industrialized as quickly or as impressively as its Western neighbors and would certainly lose an arms race. The major powers were also distrustful of each other's commitment to the cause of peace. For these reasons but also because a meeting of this magnitude had never been attempted, governments were slow to respond to the tsar's invitation. The protocol to be followed was unclear (because it did not exist), as was settling on an appropriate location. The Hague, the political capital of the Netherlands, was finally decided upon. This country was an appropriate choice. It was not so insignificant in international status to be deemed an affront to the attending dignitaries and was also inoffensive due to its neutral position in world affairs. Furthermore, the Netherlands had nurtured the great humanists and forerunners of international law, Erasmus and Grotius.

Neither conference managed to enforce any real commitment to disarmament. However, the achievements of both conferences were substantial. In all, 17 conventions and 5 declarations covering the rules governing the settlement of international disputes, the rights and duties of neutral countries in warfare, and the laws and customs of warfare on land, at sea, and in the air were passed. They still form the basis of international law and arbitration developments today.

Because of the success of the 1899 event, another conference was organized in 1907. This second congress was better planned and attended. The eyes of the world seemed to be fixated on The Hague. Hundreds of requests for topics of discussion as well as suggestions for implementing permanent peace from interested third parties (forerunners of today's nongovernmental organizations, or NGOs) were fielded by the attending representatives and the

Dutch government and queen. Given the context of the deepening arms race in Europe, crises in the Balkan region, and growing tensions between the world's great powers, the meetings at The Hague in 1907 inspired a belief that an era of peace and reasonableness could subdue and alleviate the fears of war. Rather ironically, a third Hague Peace Conference was planned for 1914. The outbreak of the First World War in July of that year, however, put those plans permanently to rest.

Pacifism and Pacifist Movements

The word "pacifism" comes from the Latin *pax* or *pacis*, which means "peace," and *facere*, which means "to make." Pacifists believe that nations should settle their conflicts as peacefully as possible and are often opposed to participating in military activity. Even though peace and justice are the objectives of all pacifists, the degree and circumstances of nonviolence vary from person to person and circumstance to circumstance. Although absolute pacifism declares that violence is wrong always and in every situation, most pacifists are on a moral and ethical continuum as it relates to force. For example, some pacifists refuse to enter the military service in any capacity, whereas others find their witness for peace as unarmed army medics. Thus, much of the writing of those advocating peace debates under what circumstances nonviolence should be national, group, or individual policy and the degree

of coercive or disciplinary violence that should be used to achieve social or personal goals.

The roots of pacifism are as old as war itself and can be traced to Asia, especially to Buddhism, several of the indigenous peoples of the Americas, and the writings of Greek philosophers such as Plato. Pacifism as a dominant form of philosophy emerged in Western thought with first-century Christianity. After hearing passages like Jesus's Sermon on the Mount, most early Christians believed that Christ called for nonviolent resistance to pagan political power and the ways of the world. Christianity did not change its stance toward violence until the third century, when it increasingly gained followers in power in the Roman empire, particularly Emperor Constantine. By the fifth century Christian thinkers, particularly St. Augustine, developed a "just war" theory. Although no longer the dominant strain of thought, pacifism still held power in many ecclesiastical circles and later reappeared in the sects founded during the Protestant Reformation. Often called the "peace churches," the groups that elevated nonresistance to doctrinal position included Mennonites, Anabaptists, Friends (or Quakers), Moravians, Brethren, and Dukhobors, a Christian group of Russian origin. Leaders from these groups have been the heart of most peace societies founded after 1815 and have been the most vocal in the cause of peace. More philosophical advocates of pacifism can be found in the writings of the sixteenth-century humanist Erasmus of Rotterdam, the eighteenth-century German philosopher Immanuel Kant, the nineteenth-century American Christian reformer Adin Ballou, and the American philosopher and psychologist William James (1842–1910). Modern pacifism began with the founding of peace societies in Massachusetts (1815), New York (1815), and England (1816); France, Switzerland, and other countries soon followed suit. William Ladd (1778–1841), the most prominent early American pacifist, brought many of these groups together in the United States, establishing the American Peace Society in 1828. These groups advocated various strategies to smooth relations between nations. Yet many of these societies or individuals, like William Lloyd Garrison (1805–1879), the most prominent American abolitionist, allowed for some degree of violence, particularly

in support of the antislavery cause. In 1843 the first peace congress met in London, and momentum seemed to be building for pacifistic reform in international relations until the American Civil War shattered the peace movement in the United States. While American peace societies were rebuilding during the latter half of the nineteenth century and European efforts were set back by the Crimean War and the wars of Italian and German unification, Sir William Randal Cremer (1838–1908) of Great Britain and Frédéric Passy (1822–1912) of France spearheaded efforts to establish the Inter-Parliamentary Union in 1889, which brought members of national electoral bodies together in periodic conferences. The same year the International Peace Bureau was founded in Bern, Switzerland. Alfred Nobel (1833–1896), the Swedish inventor of dynamite, established the Nobel Peace Prize to recognize and reward work for peace and humanitarian causes.

During the mid-1860s socialist thinkers such as César de Paepe (1841–1890) developed the International Workingmen's Association, or First International (founded in 1864), an organization of socialists, pacifists, and union supporters who believed that the cause of peace was almost impossible until private property and class inequality could be abolished. A Second International was founded in 1889, and its members advocated general strikes in case of war, arbitration treaties, arms-reduction proposals, and an end of colonialism. Militants such as Gustave Hervé (1871–1944) urged sabotage in the cause of pacifism. Vladimir Lenin (1870–1924) urged the dissolution of international boundaries as the only means of true peace. Still, most peace societies were ethnocentric and nationalistic in their viewpoint, and the association with socialism (and vegetarianism, antivivisectionism, and other "fads") in the public's mind would hurt their efforts in the twentieth century.

The high points of pre-World War I pacifism were the two International Peace Conferences held at The Hague in the Netherlands in 1899 and 1907. The first conference, the brainchild of Tsar Nicolas II of Russia, was attended by delegates from 26 nations who made no progress on the topic of disarmament, but they did approve a convention for the Pacific Settlement of

Disputes, which resulted in the establishment of the Permanent Court of Arbitration. In addition, they produced a document titled "Laws and Customs of War on Land," known as "The Hague Convention," that was one of the first international statements of the laws of war and war crimes. The second Hague Conference was convened by U.S. president Theodore Roosevelt and was attended by the representatives of 46 nations. The delegates debated but made no progress on the subjects of disarmament and the establishment of a world court. However, another meeting was planned for 1914, and many pacifists believed that an end to war was within sight. World War I shattered these illusions, but pacifist sentiment quickly reappeared with the conclusion of the war, with many peace advocates supporting the League of Nations as the forum to settle international disputes.

The Red Cross and Red Crescent Movement

The International Red Cross and Red Crescent Movement is a humanitarian movement consisting of three parts: the National Red Cross and Red Crescent Societies, the International Federation of Red Cross and Red Crescent Societies, and the International Committee of the Red Cross (ICRC). It is an independent, neutral movement, devoted to ensuring humanitarian protection and assistance for victims of war and other situations of violence.

The Red Cross movement began in June 1859 when Swiss businessman Henry Dunant (1828–1910), during a trip to Italy to visit with the French emperor Napoleon III concerning his business dealings in French-controlled Algeria, happened on the Italian town of Castiglione della Stiviere after the Battle of Solferino in the Austro-Sardinian War. It was a battle in which

6,000 men were killed and another 42,000 were wounded, many of them French troops fighting as allies of Sardinia. Many of the wounded had found their way to Castiglione, and about 500 had taken refuge in the Chiesa Maggiore, the town's church, where Dunant collected volunteers to render aid. He was appalled at the French military's lack of supplies and personnel and later described his experience in his widely read book, *Un Souvenir de Solferino* (A Memory of Solferino), published in 1862. He sent copies of his book to the leading statesmen and military leaders in Europe, urging their support for national voluntary relief organizations to treat wounded soldiers and civilians.

In 1863, the prominent Genevan lawyer Gustave Moynier (1826–1910) helped Dunant organize the International Committee for the Relief of Wounded Soldiers, composed of other prominent citizens of Geneva, including Commander of the Swiss Army General Guillaume-Henri Dufour (1787–1875), with the goal of establishing a series of national relief committees. The group called an international conference in Geneva in October 1863 which included 36 attendees and 18 official delegates from 14 countries. Among the proposals from that group was the suggestion that volunteer medical personnel from all countries should wear a white arm band with a red cross (a reverse of the Swiss national flag) which had been designed by Dufour. Within a year, nine national societies had been formed.

Dunant also thought that all medical personnel on the battlefield should be treated as neutrals, and, to that end, a second conference was convened in the Swiss capital, which drafted the Geneva Convention of August 22, 1864, for the Amelioration of the Condition of the Wounded in Armies in the Field. The convention's 10 articles called for, among other changes, universal use of the red cross emblem and protection of medical personnel, hospitals, and wounded or sick combatants.

Although the red cross was never intended as a religious symbol, Islamic countries found it objectionable. During the 1876 Russo-Turkish War, the Ottoman Society for Relief to the Wounded chose a red crescent on a white background, and that emblem was subsequently adopted by the majority of Muslim nations.

The Geneva Convention elevated rules regarding care and protection of the sick and wounded from ad hoc agreements to the status of international law. The conventions were expanded in 1899, 1906, 1907, 1929, 1949, and 1977 and currently comprise four conventions and a collection of additional protocols. Dunant's committee, renamed the International Committee of the Red Cross, is the protector of the conventions and is also responsible for admitting new national societies to the movement.

In 1919, Henry Davison, the head of the American Red Cross, called an international conference to associate the various national societies. That conference resulted in the League of Red Cross Societies, subsequently renamed the International Federation of Red Cross and Red Crescent Societies in 1991. In 1928, the League, the International Committee of the Red Cross, and the various national societies joined as the International Red Cross which was renamed the International Red Cross and Red Crescent Movement in 1986.

The Nobel Peace Prize—Establishment and Early Winners

The Nobel Peace Prize recognizes the contributions made by individuals and groups toward promoting and achieving peace. The prize was instituted by Alfred Nobel (1833–1896), a Swedish engineer and chemist who generated a large fortune as the owner of Bofors, which he transformed from an iron manufacturer to an armaments maker. Controversy attended Nobel's decision to bequeath part of his fortune to fund this and other awards immediately after his death in December 1896. Legal challenges and opposition to the will's provisions by relatives and other interested parties prevented the

prize—along with others in chemistry, physics, medicine, and literature—from being presented until 1901. Even then, the Nobel Committee's decision to divide the first award between two recipients caused consternation in some circles. Other precedents established during the first few years of the Nobel Peace Prize's existence have influenced its development down to the present.

Nobel composed his will without the aid of a lawyer, which resulted in ambiguities in jurisdiction, language, and details. The Norwegian legislature (the Storting) and the scientific institutions that were intended to assume the responsibility of selecting recipients had never been consulted, for instance, which made ensuring their collaboration and devising the means for them to do so just one of many problems that the will's executors had to resolve. Despite seemingly insurmountable difficulties, the Nobel Foundation was established in June 1900 to carry out Nobel's wishes, at least insofar as these had been determined amid the maelstrom of negotiations, compromises, and legal actions undertaken after his death.

The will had called for a prize to be awarded to a person "who shall have done the most or the best work for fraternity between nations, for the abolition or reduction of standing armies and for the holding and promotion of peace congresses." This concern reflected the influence of Bertha von Suttner, a friend of Nobel's who was a well-known peace activist. During the nineteenth century, especially after 1889, a peace movement with an agenda echoed in Nobel's will grew in size and influence among a liberal middle-class constituency convinced that the benefits of science, industry, and political reform could guide the world to a future free from war. Peace advocates in peace societies whose local and national efforts were coordinated through an International Peace Bureau lobbied for international treaties of arbitration, institutions to foster greater international cooperation, and even gradual steps toward disarmament.

The Nobel Committee's decision to select two recipients for the first award in 1901 demonstrated how flexibly it interpreted its mandate. Frédéric Passy had been a leader in the

international peace movement for decades and represented exactly the kind of activist many believed Nobel had in mind as he drew up his will. The choice of Henry Dunant, founder of the International Committee of the Red Cross (ICRC), to share the award with Passy irritated many peace activists, who pointed out that the ICRC sought not to abolish war itself but to alleviate some of the suffering that it created. Dunant had never worked in the ranks of the peace movement, nor had he been consistently involved with the ICRC for decades, considerations that marked him as undeserving to many peace activists. Others argued that Dunant's initiative contributed substantially to the goal of "work[ing] for fraternity between nations" articulated in Nobel's will. An enduring result of this decision and the rationale behind it has been the recognition of humanitarians, human rights activists, and others involved in diverse but indirect ways toward addressing a host of factors and issues associated with peace. Such a liberal approach to interpreting Nobel's will can also be seen in the committee's choice to present the award to organizations, such as the Institute of International Law (1904) and the International Peace Bureau (1910), rather than an individual "person" as stated in the will.

Most other recipients awarded the Nobel Peace Prize in the period before 1914 fit a conventional profile of peace activists and internationalists of the time: leaders of peace organizations, such as Élie Ducommun (1902) and Ernesto Moneta (1907); diplomats committed to international cooperation, such as Paul Henri d'Estournelles de Constant (1909) and Elihu Root (1912); and international jurists who contributed to the agreements reached at the two Hague Conferences (1899 and 1907) and the work of the Permanent Court of Arbitration, such as Louis Renault (1907) and Auguste Beernaert (1909). Objections were raised when U.S. president Theodore Roosevelt received the award in 1906, given his generally aggressive foreign policy. Similar objections have been occasionally voiced as statesmen with less than stellar records in the cause of peace have been awarded the prize for singular instances of international conciliation. This too is a custom that

➤ BERTHA VON SUTTNER—THE WOMAN BEHIND THE NOBEL PEACE PRIZE

The Nobel Peace Prize might never have been established had an Austrian countess not attempted to flee from a love affair. Bertha, Countess Kinsky, fell in love with Albert von Suttner, the youngest son of a Viennese family who had hired her as a tutor for their daughters. When Albert's parents objected to the relationship, Bertha left Vienna and ended up in Paris in 1876, where she found employment as Alfred Nobel's secretary. She held onto this position only briefly before returning to Vienna to elope with Albert.

In 1889 Bertha von Suttner published a best-selling novel with an antiwar message, *Lay Down Your Arms!*, which has sometimes been described as the *Uncle Tom's Cabin* of the peace movement. Although von Suttner had not been directly involved in the peace movement until then, she quickly emerged as an influential figure, organizing an Austrian peace society in 1891. Having continued to correspond with Nobel ever since 1876, she persuaded him to leave part of his fortune to fund the famous peace prize. In 1905 von Suttner's contributions were recognized when she was named the first woman Nobel peace laureate.

Gandhi and the Philosophy of Non-Violence

Born Mohandas Karamchand Gandhi, Mahatma (or “Great Soul”) Gandhi (1869–1948) is a twentieth-century icon of nonviolence. His philosophy of *ahimsa*, or noninjury to any living being, was a concept he shaped and experimented with throughout his life. Frequently used as a synonym for pacificism, *ahimsa* consists of an expression of the deepest love for all humans, including one’s opponents. In Gandhi’s mind, nonviolence was not simply a political tactic used solely for liberating people but instead was a method of self-purification and an instrument for attaining social and political change. In his nonviolence, Gandhi incorporated elements from Eastern and Western systems of thought while he

studied and practiced law in India, England, and South Africa. Therein lie its global appeal and its relevance to conflict resolution in different parts of the world.

Born at Porbander, Gujarat, in western India on October 2, 1869, Gandhi deeply absorbed the ideals of noninjury from Jain and Buddhist beliefs prevalent in the region. Although a Hindu by birth and upbringing, Gandhi did not worship idols or in temples but instead drew much of his understanding of life and truth from ancient Hindu texts such as the Bhagavad-Gita and his ethics from Buddhist scriptures.

The notion of truth, or *satya*, is central to nonviolence. Gandhi saw truth as being multifaceted and therefore unable to be grasped in its entirety by any one individual. We all carry pieces of truth, he believed, but need pieces of other truths in order to pursue the greater truth. As there was uncertainty in discovering these truths, he termed his moral quests “experiments with truth.” Therefore, *satya* implies honesty and fairness, and *ahimsa* entails nonviolence with tolerance for a degree of suffering.

Nonviolence does not mean avoiding conflict but instead means gravitating toward the heart of it in order to resolve a contentious issue. Gandhi practiced this as a *karmayogi*, or a follower of action, as early as the age of 13, when he tried to overcome the existing father-son conflicts so typical in Indian society. By tenderly nursing his strict sick father after an accident during Gandhi’s wedding in 1883 and overcoming his resentments toward his father, Gandhi came to the belief that a strong adversary could be challenged nonviolently and conquered through love and care.

A greater part of Gandhi’s understanding of nonviolence was formulated while he was abroad and tested considerably by the time he returned to India in 1914. The London years (1888–1891) were crucial for his intellectual growth and moral conviction. It was here that Gandhi began his experiment with diet, so essential to *ahimsa*, when he joined the London Vegetarian Society. And it was through this organization also that he was introduced to the ideas of two writers who later influenced his own work: the Russian aristocrat Leo Tolstoy and the Victorian moralist John Ruskin. Tolstoy’s *The Kingdom of God Is Within You*, which Gandhi

➤ GANDHI ON HOME RULE

“I would say to the extremists: ‘I know that you want Home Rule for India; it is not to be had for your asking. Everyone will have to take it for himself. What others get for me is not Home Rule but foreign rule; therefore, it would not be proper for you to say that you have obtained Home Rule if you have merely expelled the English. I have already described the true nature of Home Rule. This you would never obtain by force of arms. Brute-force is not natural to Indian soil. You will have, therefore, to rely wholly on soul-force. You must not consider that violence is necessary at any stage for reaching our goal.’ I would say to the moderates: ‘Mere petitioning is derogatory; we thereby confess inferiority. To say that British rule is indispensable, is almost a denial of the God-head. We cannot say that anybody or anything is indispensable except God. Moreover, common sense should tell us that to state that, for the time being, the presence of the English in India is a necessity, is to make them conceited.’”

Mahatma Gandhi, “Indian Home Rule,” in *The Gandhi Reader: A Source Book of His Life and Writing*, Vol. 1, edited by Homer A. Jack (Bloomington: Indiana University Press, 1953), 117.

read in Durban in 1894, was instrumental in confirming his belief in nonviolence. For Gandhi, ahimsa then appeared as evidence of the divine nature innate in all humans and therefore was the very embodiment of truth and God. Significantly, Gandhi formulated his concepts and initiated his actions for the first time in South Africa, as he himself proclaimed: "That God-forsaken continent where I found my God."

In South Africa for the first time Gandhi put to practice Henry David Thoreau's idea of civil disobedience. The equivalent technique that Gandhi developed was his *satyagraha*, or "power of truth." Specifically devised as a practical extension of ahimsa and love, it meant a nonviolent non-cooperation with evil. A challenge to this belief came in 1893 when Gandhi experienced racial discrimination. He was pushed out of a first-class railway compartment in the province of Natal, in spite of possessing a valid ticket. From this incident, Gandhi decided that one must firmly stand on principles, without hatred. This

incident was indicative of an effective resistance to apartheid, which later became part of Gandhi's wider struggle against colonialism. It also brought into focus his neat blend of morality with politics. Gandhi's participation in the Transvaal Civil Rights campaign between 1907 and 1913 became a precursor in many ways of the larger nonviolent noncooperation effort that he launched against British rule on his return to India.

Thought and Religion

In an era of political upheaval, scientific discovery, economic change, and ever-greater interaction among the world's peoples, significant changes in the areas of thought and religion were inevitable. Intellectuals were forced to reconsider ancient verities about justice, political power, morality, human nature, humankind's place in the universe, and a host of other issues. Similarly, religious leaders, theologians, and countless individual believers were forced to come to terms with a rapidly changing world. Although challenged by science, secularism, and states determined to limit its role in education and public life, religious belief remained a powerful force in the lives of millions of human beings and a prism through which intellectuals sought understanding of the world and humankind's place in it.

Religion remained important even in Europe, a region where many historians have discerned a decline in religious commitment from the eighteenth century onward. True, between 1750 and 1914 European states no longer went to war because of Catholic-Protestant conflict, and universities no longer saw their role mainly as one of protecting orthodoxy and serving the interests of organized churches. Enlightenment writers in the eighteenth century castigated organized religions for their intolerance, hypocrisy, and conservatism; French revolutionaries briefly replaced Christianity with a religion of reason; and republican and socialist political parties in the nineteenth century tended to be anticlerical. During the 1800s the papacy was forced to relinquish its authority over the Papal States and the city of Rome, and new systems of publically funded schools broke the churches' monopoly on education. Christian churches also faced major intellectual challenges from new approaches to biblical scholarship, new theories about the age of the earth, and Charles Darwin's theories of evolution.

Despite such setbacks and difficulties, the level of religious devotion among most Europeans remained high. Overall church attendance in Europe seems to have declined somewhat, but this is counterbalanced by the increasing demand for printed Bibles and religious literature of all sorts, the construction of large numbers of new churches and synagogues, the upsurge of support for foreign missions, and the growing cult of miracles and devotion to the Virgin Mary among Catholics. Organized churches and religious individuals led campaigns on behalf of temperance and the abolition of slavery and provided charitable support for hospitals, orphanages, Sunday schools, sports clubs, and organizations such as the Salvation Army, which worked among alcoholics and prostitutes.

Outside of Europe, religious sentiment remained strong. In Latin America, despite the anticlericalism of liberal politicians, popular devotion to Roman Catholicism did not waver. And in the United States,

as many foreign visitors noted, religious enthusiasm was a distinctive feature of American life. Three out of four Americans in the nineteenth century were church members, and many of the unchurched were drawn to the preaching of itinerant revivalists or attended camp meetings, where visitors would gather for days or weeks to sing hymns and hear nonstop sermons urging repentance and surrender to Jesus. The so-called Second Great Awakening, which took place from the 1790s through the 1840s, was a period of evangelism and religious enthusiasm that contributed to movements for social reform and was the seedbed from which Mormonism took root in the 1820s.

One expression of religiosity in Europe and areas of European settlement had worldwide repercussions. Missionary zeal in the nineteenth century took hold of Protestants and Catholics alike, and by the

Missionary zeal in the nineteenth century took hold of Protestants and Catholics alike, and by the late 1800s missionaries were active in Oceania, Africa, China, India, and even the Middle East.

late 1800s missionaries were active in Oceania, Africa, China, India, and even the Middle East. Measured in terms of converts to Christianity, all this missionary activity was not very successful. An exception was Oceania, where large numbers of Maori in New Zealand and inhabitants of hundreds of other Pacific islands converted to Christianity. In Africa, new

Christian communities were created in Liberia, Sierra Leone, Buganda, Madagascar, the Congo, and parts of southern Africa. But Christianity's spread in Africa mainly took place in the twentieth century and was more the work of African evangelists than foreign missionaries. In India, China, Southeast Asia, and the Middle East, missionaries had an impact disproportionate to the small number of converts. As educators, translators, providers of health care, and critics of competing belief systems and customs, they were vehicles through which the values and accomplishments of the West were introduced to Asians and Africans. Furthermore, although less important than European emigration and overall population growth, new conversions contributed to the worldwide increase in the number of Christians from approximately 205 million in 1800 to 558 million in 1900.

Religion's continuing importance can be measured in other ways. New religions such as Mormonism, founded by Joseph Smith in upstate New York in the 1820s, and the Baha'i Faith, which originated in mid-nineteenth-century Persia, took root and gained large followings. Reform and revivalist movements energized many faiths, including Hinduism, Islam, Judaism, and Christianity. Religion also continued to be a major force in politics. Islam inspired a series of jihads in the 1800s that redrew the religious and political map of Africa from the Hausa states in the west to Sudan in the east. It also contributed to rebellions in western China between 1855 and 1873 and along with Hinduism contributed to the outbreak of the Indian Rebellion in 1858. Christianity made an important contribution to the ideology that fueled the massive Taiping Rebellion in China between 1850 and 1864. Traditional African religion inspired events such as the Xhosa Cattle Killing of 1856, in which a young girl prophesied that the Xhosa should kill their cattle

and abandon their fields so that a new Xhosa nation could arise. It also played a central role in the Maji-Maji Rebellion of 1905–1907 in which a spirit medium convinced the people of German East Africa that they were destined to drive out the Germans and would be protected from German bullets by a special medicine.

Religion also was deemed sufficiently important to be utilized and manipulated for political purposes. Meiji reformers in Japan in the 1870s launched a brief campaign to promote Shintoism, Japan's traditional religion, as a way of encouraging proper civic behavior and respect for the emperor and nation. Ottoman sultan Abdulhamid II (r. 1876–1909) sought to gain support from his largely Muslim subjects by emphasizing his devotion to Pan-Islamism and his role as caliph, the successor of Muhammad as the head of the worldwide Muslim community. From the 1880s onward, Russian tsarist officials did little to discourage and in some instances promoted the anti-Jewish riots that swept through southwestern Russia as a way of directing popular discontent from the government to a convenient scapegoat.

Just as organized religions were challenged by the relentless pace of change between 1750 and 1914, so too was the relatively small but important group of writers, political commentators, philosophers, scholars, journalists, theologians, and social critics who are collectively lumped together as intellectuals. What it meant to be an intellectual varied from one society to another. In China, intellectual life was dominated by scholar-officials who immersed themselves in Confucian philosophy, historical research, and literature in addition to serving in the imperial bureaucracy. In the Islamic world, intellectual and religious thought was dominated by the *ulema*, religious scholars who served as jurists, mosque officials, educators, and advisers to rulers. Until the nineteenth century, Hindu learning was a monopoly of a small group of *pandits*, scholars and teachers of literature and philosophy drawn mainly from the Brahmin caste who had mastered the ancient language of Sanskrit and committed parts of the Vedas to memory. In Europe and areas of European settlement, intellectuals might be journalists, writers, academics, scientists, or religious leaders.

In contrast to India and the Islamic world, where all intellectual matters were intertwined with religion, in the Western world intellectual discourse was largely secular. In Europe, intellectuals in the 1800s abandoned the biting anticlericalism of the eighteenth-century Enlightenment and left the discussion of religious issues to a small number of academic theologians. Scientists pursued their studies and published their findings, even on controversial subjects such as the age of the earth and evolution, with scant regard for their religious implications. Karl Marx dismissed religion as an illusion designed to encourage docility among the poor and spent little time discussing its role in human affairs; Freud asserted that religion was an expression of underlying neurosis and psychological distress.

Karl Marx dismissed religion as an illusion designed to encourage docility among the poor and spent little time discussing its role in human affairs; Freud asserted that religion was an expression of underlying neurosis and psychological distress.

Representative philosophies of the era were pragmatism, whose largely American disciples believed that the usefulness and practicality of ideas and policies defined their merit, and positivism, whose founder Auguste Comte (1798–1857) argued that humanity had passed through three stages: the Religious (in which knowledge was based on tradition and revelation), the Metaphysical (in which people began to reason and speculate but with little factual knowledge), and finally the Positive or Scientific (in which any and all conclusions pertaining to business, government, and society would be based on facts and facts alone). He coined the term “sociology” for the fact-based study of society. Comte’s influence and the scientific spirit of the age can be seen in the proliferation of other new “social sciences,” including political science, economics, anthropology, psychology, and the “new history” championed by the German Leopold von Ranke (1795–1886), who argued that history must be based on facts derived from primary sources and written to describe the past “as it really was.”

For most Western intellectuals the nineteenth century was a time of growing confidence in science and the soundness of Western values and institutions. For thinkers and intellectuals in the Islamic world, India, and East Asia, however, it was a time of self-doubt, self-scrutiny, and debate in the face of new and unsettling realities. The expansion of Western power throughout the world made a mockery of the Muslims’ conviction that devotion to Allah guaranteed political and military success. It had a similar effect on the Chinese belief in the superiority of their values, institutions, and achievements. The key question became how to respond to the Western threat. Some conservatives sought salvation in religious reform, renewed dedication to historic principles, and efforts to recapture the practices of a previous golden age. Most, however, concluded that at least some borrowing from the West was needed, but such a conclusion only led to more questions. What needed to be borrowed, and, more importantly, how much could be borrowed without destroying essential features of the society or civilization that one was trying to preserve?

Acceptance of Western institutions, ideas, and technologies inspired fewer debates and less resistance in India and Japan than in China and the Islamic world. Japan had no entrenched religious establishment to oppose Westernization and fewer reservations about borrowing from foreigners, since much of its culture and many of its values had been modeled on those of its continental neighbors, mainly China. Furthermore, many writers had subjected the Tokugawa regime to increasing criticism from the 1770s onward, and most Japanese were convinced that the regime had responded ineffectually to Western pressures following the arrival of Commodore Perry in 1853. Except for a small number of disgruntled samurai, once the Meiji Restoration ended the Tokugawa shogunate, no group or individual was interested in defending the defunct dynasty’s policies and practices. This left the way open for Meiji reformers to bring in Western consultants of all sorts, revamp the educational system, provide a European-style constitution, and embrace industrialization. Journalists, academics, and other writers debated the relative merits of Japanese and Western cultural norms and

the extent to which Japanese history and literature should be taught in schools and universities. Although the debate was not without extremists, most argued that Japan should pursue a middle course that meshed indigenous and alien elements. This of course was precisely the policy of the Meiji state.

In India, Hindu intellectual life had languished during centuries of Muslim rule but came to life under the British. The introduction of modern printing presses gave rise to a publishing industry that made available to a broader audience a wide variety of texts, including versions of the Vedas and other sacred writings, and made possible a flourishing newspaper industry. More importantly, the British established a system of education made up of universities, training colleges for teachers, high schools, and vernacular elementary schools. Although shunned by Muslims and conservative Hindus, many Hindus flocked to the new schools, which taught a Western-style curriculum, usually in English. Education opened the door to employment with the East India Company and the Indian Civil Service and was considered a mark of prestige for middle- and upper-class families. By 1900 a new type of Indian intellectual, one who wrote in English and was well versed in Western history, literature, and philosophy, had come into existence.

A few of these Anglicized Indians became Christians, but most remained Hindus dedicated to reviving and strengthening Hinduism against the claims of Christian missionaries that Hinduism was a pagan and idolatrous religion burdened with superstitions and barbarous practices. A prime example is Rammohun Roy (1774–1833), a leader of the Hindu Renaissance and the “father of modern India.” A prolific author and founder of a school for girls, newspapers, and an organization of learned individuals for the discussion of religion and social reform, Roy attacked idolatry, child marriages, and the suppression of women; he also defended Christian ethical teachings and the compatibility of science and Hinduism. India’s intellectuals not only inspired reforms within Hinduism but also provided leadership for India’s nationalist movement. In 1885 they played a key role in the founding of the Indian National Congress, the organization that under Mohandas Gandhi, another product of British schools, led the struggle for independence in the twentieth century.

The reaction of Islamic religious leaders and intellectuals to European influences and European expansion differed from region to region but on the whole was decidedly more negative than that of their Japanese and Indian counterparts. For some, Western science, politics, and legal theories were fundamentally incompatible with Islam. For others, centuries of conflict with Christian Europe made it difficult to admit that there was anything worth imitating from the West. Thus, throughout much of the nineteenth century many Islamic religious leaders resisted efforts by Ottoman, Egyptian, and Persian rulers to modernize their armies, legal systems, and economies along Western lines. By the end of the 1800s, however, with the Ottoman empire near collapse, Egypt under British control, and the Mughal empire in India abolished, debate about the future of the Islamic community intensified. Jamal ad-Din al-Afghani (1838–1897) and his disciple Muhammad Abduh (1849–1905) became spokesmen of what came to be known as Islamic

modernism. Although Abduh was an Egyptian and Jamal-ad-Din was by birth a Persian, their writings addressed all Muslims, urging them to resist European imperialism but only after Islam had come to terms with modern science and rationalism. Other writers advocated Turkish

or Arab nationalism, defended further secularization, called for renewed religious devotion, or dedicated themselves to specific projects such as improving the status of women. Consensus about Islam's future was notably lacking as the twentieth century began.

No intellectuals had more difficulty responding to the challenges of the nineteenth century than those of China. As had been true for centuries, to be an in-
